School Chamber in Nottingham given by
William Stetinfest*

*The copie of the said Letter, written as touching the
Translation of Plinie.*

MI beloued, in twentie yeeres and better, so many tokens of our mutuall
loue passing betweene vs, I need not now to professe my affection to
your selfe; and my daily conuersing with you, hath yeelded my approba-
tion of your tedious labor in translating Plinie. These few lines there-
fore shall onely serue to witnesse vnto others the deserved account
which for your learning I haue alwaies made of you, and my conceit of
this your trauaile in opening to your countrymen the treasure of Nature: therein to see
and to admire the wisdom, power, and the goodnesse of the onely true God, the Fram-
er of Nature. I am not of their minds, who desire that all humane learning in Arts and
Naturall Philosophie should be reserved vnder locke and key of strange language, with-
out the which no other man should haue access vnto it: For as such knowledge is a branch
of that excellencie wherein man was formed, so the repaire thereof (though it bee not the
chiefe) is yet a thing unworthily neglected, as well in regard of our owne comfort therein
gained, as for the glory of God thereby promoted. And it was the wisdom and provid-
ent hand of the All-sufficient, so to guide the wise heathen in Arts and Nature, that they
should publish such their skill vnto their countrymen in mother tongue: partly to correct
the rudenesse which is in ignorance, and in part to leaue them the more inexcusable: In
which regard, they may in some sort be called, The Prophets and Teachers of the heathen.
And though Plinie and the rest were not able by Natures light to search so far as to find
out the God of Nature, who sitteth in the glorie of light which none attaineth, but contra-
rily in the vanitie of their imagination bewrayed the ignorance of foolish hearts, some
doting vpon Nature her selfe, and others vpon speciall creatures as their God: yet feare
we not that Christians in so cleare light should be so farre bewitched by such blind teachers;
as to fall before those heathen Idols. Yea, though some of them (as namely Plinie) haue
spoken dishonourably of the onely true God and of his providence, because they knew him
not; which speeches (if it might stand with the lawes of Translation) I could wish were
utterly omitted; yet may we hope that Christian men so long taught by the light of grace
out of the holy word of God, will no lesse therefore giue him his deserved honour, than
when they doe in like sort heare the blasphemie of Sanncherib king of Asbur, who sent to
raile vpon the liuing God. I feare not the corrupting of vnsstable minds any thing so much
by these foolish Gentiles which are without, as by the deceitfull spirit of error speaking in
the mouth of men within: such I meane as are within the bosome of the Church. These are
the foxes by whom we feare the spoile of the Lords vines when as the grapes first begin to
cluster; for whose taking I desire that all Gods husbandmen would be more carefull. As
for the speeches of these blind heathen, the true Christian may well thereby be provoked to
extoll the mercie of God, who sitteth in so glorious a light as hath dashed the sharpest sight
of Nature; but for our comfort hath put a vaile vpon his glorie, and by his grace hath so
cleared

The Preface to the Reader.

cleared the eye of our understanding, that we might see his face in his beloved, and know him to be the onely true God, and his blessed providence upon all his creatures. And when they shall perceiue that the wisest cleark in naturall skill could not learne by the booke of heauen and earth to know their Maker, whose glorie they declare, and handworkes see out; nor who it was that framed Nature, when by his word he first created them in such excellencie, and then, by his blessing gaue, and by his providence working all in all, doth yet maintaine such an operative power, as by the which they are still continued in their kindes: nor how it came to passe that Nature lost her excellencie in all creatures, and her power vnto good was not onely weakened (whence we see her faile in many of her purposes) but also peruerued vnto euill; then (I say) they will the more be stirred up by Gods grace to make reuerent account of the holy Scriptures, which God in rich mercie hath giuen to them to be a light in all things for to direct them through the errors in Natures blindnesse, and to bring them to the heauenly Jerusalem and happie world of all the holie where he dwelleth, whom they worship in vnitie and trinitie. Proceed then my beloved friend to bring vnto the birth your second labour; whereof I pray that God may haue honour in the praise of his works throughout nature, and wish you comfort in good acceptance with the reader, and your countrie vse and pleasure in the skill thereof. Vnto him which onely hath immortalitie and dwelleth in that light which none attaineth, to God onely wise be all honour and glorie. Iunij xij. 1601.

Your louing friend in the Lord,

H. F.

TO THE RIGHT HONOURABLE
SIR ROBERT CECIL KNIGHT, PRINCIPALL
SECRETARIE TO THE QUEENS MAIESTIE,
MASTER OF COVRT OF THE WARDS AND LIVERIES,
Chancellor of the Vniuersitie of Cambridge, and one of her
Most Excellent Majesties Privie Counsaile.

He friendly acceptance which T. Livius of Padua, hath found in this Realme, since time hee showed himselfe in English weed vnto her sacred Majestie, hath trained over vnto him his neighbour Plinius Secundus, from Verona. Whome, being now arraid in the same habit, yet fearefull to set foot forward in the forreine ground, without the countenance of some worthie personage, who might both giue him his hand at his first entrance, in token of welcome, and also grace him afterwards with a favourable regard to win acquaintance, I humbly present vnto your Honour. For considering the qualitie of the man, a Philosopher discoursing so deeply in all Learning, where may hee looke for better acceptance than of him, who is most iustly styled, Patron of Learning? Which dignitie conferred of late vpon your H. by the generall suffrages of a Noble Vniuersitie (and that for your singular insight in all literature) as a complement to those high places whereunto the fauour of a most prudent and judicious Princeesse hath advanced you, and the same correspondent to the same wisdom, justice, and eloquence, which concurre in your person, like the seuerall beauties of the Rubie, Amethyst, and Emerald meeting in one faire Opal, giue a lovely lustre to your other titles, no lesse, than if the nine Muses and Apollo, represented naturally in that rich Agat of K. Pyrrhus, were inserted therein. Now if, as wee read of * Alexander * Magnus: and * Demetrius, two mightie monarchs, who amid their desseines and making conquests and besieging cities, beheld otherwhiles Apelles and Protogenes how they handled their pencils; it may please your Honour betweene the managing of State-affaires vnder her Majestie, to cast your eye eftsometimes vpon Plinie for your recreation, and see how liuely hee depeincteth, nor Venus Anadyomene, drawne haply to the patterne of Campaspe a courtizan; nor Ialysus with his dog, in which picture, fecit Fortuna naturam; but euen Nature her selfe, the immediat mother and nource of all things vnder the Almighty; I shall not onely thinke him patronized thereby and sufficiently commended to the world, but also acknowledge my selfe much deuoted to your H. and bound for euer to pray for the increase thereof, with long life and true happinesse.

Your Honours most readie at command,

Philemon Holland.

The Preface to the Reader.

HAppie were they in times past reputed (and not vnworthily) who had that gracious and heauenly gift, *aut facere scribenda, aut scribere legenda*: that is to say, either to do such things as deserued to bee written, or to write that which was worth the reading. Those that could not attaine to these two branches of felicitie, and yet vtterly misliked idlenes, contented themselues in a third degree, namely to take in hand the old workes of their ancients, and by new labours to immortalize their memorie. Thus *Nicophanes* (a famous painter in his time) gaue his mind wholly to antique pictures, partly to exemplifie and take out their patternes after that in long continuance of time they were decayed; and in part to repaire and reforme the same, if haply by some iniurious accident they were defaced. The ingenious mind of this artizan thus deuoted to antiquitie, as I doe highly commend; so I cannot chuse but embrace his policie, seeking hereby to auoid the enuie and reproofe of others. In this number I must range those learned men in seuerall ages, who to illustrate the monuments left by former writers, haue annexed vnto them their Commentaries; to saue them entire and vncorrupt, haue set thereto iudiciall obseruations; and to publish them for a generall benefit of posteritie, haue translated the same into their mother language. As for my selfe, since it is neither my hap nor hope to attaine to such perfection, as to bring forth somewhat of mine owne which may quit the paines of a reader; and much lesse to performe any action that might minister matter to a writer; and yet so farre bound vnto my natie countrey and the blessed state wherein I haue liued, as to render an account of my yeeres passed and studies employed, during this long time of peace and tranquillitie, wherein (vnder the most gracious and happy gouernement of a peerelesse Princessse, assisted with so prudent, politique, and learned Counsell) all good literature hath had free progresse and flourished, in no age so much: mee thought I owed this dutie, to leaue for my part also (after many others) some small memoriall, that might giue testimonie another day what fruits generally this peaceable age of ours hath produced. Endeauoured I haue therefore to stand in this third ranke, and bestowed those houres which might be spared from the practise of my profession, and the necessarie cares of this life, to satisfie my countrimen now liuing, and to gratifie the age ensuing, in this kinde. Like as therefore I haue trauelled alreadie in *Titus Livius* a renowned Historiographer, so I haue proceeded to deale with *Plinius Secundus* the elder, as famous a Philosopher. Now albeic my intention and only scope was, to doe a pleasure vnto them that could not read these authours in the original: yet needs I must confesse that euen my selfe haue not only gained thereby encrease of the Latine tongue (wherein these workes were written) but also growne to further knowledge of the matter and argument therein contained. For this benefit wee reape by studying the bookes of such ancient authours,

That

The Preface to the Reader.

That the oftner we read them ouer, the more still we find and learne in them: as beeing so judiciously and pithily penned, that, as the Poet said very well, *decies repetita placent*. Well may the newest songs and last deuised plaies delight our ears at the first, and for the present rauish our senses: like as horarie and carely Summer fruits content our tast and please the appetite: but surely it is antiquitie that hath giuen grace, vigor, and strength to writings; euen as age commendeth the most generous and best wines. In which regard, and vpon this experience of mine owne, I nothing doubt but they also whom I might iustly feare as hard censours of these my labours, will not onely pitie mee for my paines, but also in some measure yeeld mee thanks in the end, when either by the light of the English (if they be young students) they shall bee able more readily to goe away with the darke phrase and obscure constructions of the Latine; or (being great schollers and taking themselues for deepe Critickes) by conferring the one with the other, haply to espie wherein I haue tripped, they shall by that meanes peruse once againe, and consequently gather new profit out of that authour whom peraduenture they had laid by for many yeers as sufficiently vnderstood. When some benefit (I say) shall accrew vnto them likewise by this occasion, I lesse dread their fearefull doome, to which so wilfully I haue exposed my selfe. Well I wist, that among the Athenians, order was taken by law, That an enterlude newly acted should be heard with silence and applause: which custome, as it was respectiue and fauourable to the first endeauours of the actours, so it implied an ineuitable danger of hissing out an vtter disgrace, if afterwards they chanced to misse and faile in their parts. Hauing shewed my selfe once before vpon the stage, presuming vpon this priuiledge and the curesie of the theatre, I might haue now sitten still and so rested: In mounting vp thus soon againe, I may seeme either in the assured confidence of mine owne worthinesse, to proclaime a challenge to all mens censures; or else vpon a deepe conceit of some generall conuiniencie make reckoning of an extraordinarie and wonderfull fauor. But as the choise that I haue made to publish the monuments of other men, without fathering any thing of mine owne, doth excuse and acquit mee for the one; so the froward disposition of carpers in these daies wherein wee liue, will checke the other. Howbeit considering such paines vndergone by me one man, for the pleasure of so many; so much time spent of mine, for gaining time to others; and some opportunities of privat lucre ouerslpt and lost, to win profit vnto all; I feare not but these regards may deserue a friendly acceptance, & counterweigh all defects and faults escaped, whatsoeuer. The persuation hereof, but principally the priuitie of my affectionat loue vnto my countrey (which assured me of a safe-conduct to passe peaceably through their hands who are of the better sort and well affected) induced mee to a resolution not onely to enter vpon this new taske, but also to breake through all difficulties, vntill I had brought the same, if not to a full and absolute perfection, yet to an end and finall conclusion. Besides this naturall inclination and hope which carried mee this way, other motiues there were that made faile and set mee forward. I saw how diuerse men before me had dealt with this authour, whiles some laboured to reforme whatsoeuer by iniurie of time was growne out of frame: others did their best to translate him into their own tongue, and namely, the Italian and French: moreouer, the Title prefixed thereto so vniuersall as it is, to wit, *The Historie of the World*,

The Preface to the Reader.

or *Reports of Nature*, imported (no doubt) that hee first penned it for the generall good of mankind.ouer and besides, the Argument ensuing full of varietie, furnished with discourses of all matters, not appropriate to the learned only, but accommodat to the rude peisant of the countrey; fitted for the painefull artizan in towne and citie: pertinent to the bodily health of man, woman, and child; and in one word, suiting with all sorts of people living in a societie and commonweale. To say nothing of the precedent giuen by the authour himselfe who endited the same, not with any affected phrase, but sorting well with the capacitie euen of the meanest and most vnlettered: who also translated a good part thereof out of the Greeke. What should I alledge the example of former times, wherein the like hath euermore been approued and practised? Why should any man therefore take offence hereat, and enuie this good to his naturall countrey, which was first meant for the whole world? and yet some there be so grosse as to giue out, That these and suchlike bookes ought not to bee published in the vulgar tongue. It is a shame (quoth one) that *Linie* speaketh English as hee doth: Latinitis onely are to bee acquainted with him: as Who would say, the fouldiour were to haue recourse vnto the vniuersitie for militarie skill and knowledge: or the scholler to put on armes and pitch a campe. What should *Plinie* (saith another) bee read in English, and the mysteries couched in his bookes divulged: as if the husbandman, the mason, carpenter, goldsmith, painter, lapidarie, and engrauer, with other artificers, were bound to seeke vnto great clearkes or linguists for instructions in their seuerall arts. Certes, such *Momi* as these, besides their blind and erronious opinion, thinke not so honourably of their native countrey and mother tongue as they ought: who if they were so well affected that way as they should be, would with rather, and endeauiour by all meanes to triumph now ouer the Romans in subduing their literature vnder the dent of the English pen, in requittall to the conquest sometime ouer this Island, atchieued by the edge of their sword. As for our speech, was not Latine as common and naturall in Italie, as English here with vs. And if *Plinie* faulted not but deserued well of the Romane name, in laying abroad the riches and hidden treasures of Nature, in that Dialect or Idiome which was familiar to the basest clowne: why should any man be blamed for enterprising the semblable, to the commoditie of that countrey in which and for which he was borne. Are wee the onely nation vnder heauen vnworthie to tast of such knowledge? or is our language so barbarous, that it will not admit in proper tearmes a forreine phrase? I honor them in my heart, who hauing of late daies troden the way before mee in *Plutarch*, *Tacitus*, and others, haue made good prooffe, that as the tongue in an Englishmans head is framed so flexible and obsequent, that it can pronounce naturally any other language; so a pen in his hand is able sufficiently to expresse Greeke, Latine, and Hebrew. And my hope is, that after mee there will arise some industrious *Flarvij* who may at length *cornicum oculos configere*. For if my selfe, a man by profession otherwise carried away, for gifts farre inferiour to many, and wanting such helps as others bee furnished with, haue in some sort taught those to speake English who were supposed very vntoward to bee brought vnto it; what may be expected at their hands, who for leisure may attend better; in wit are more pregnant; and being graced with the opinion of men and fauour of the time, may attempt what they will, and effect whatsoeuer

The Preface to the Reader.

ver they attempt with greater felicitie? A painfull and tedious trauaile I confesse it is; neither make I doubt but many doe note mee for much follie in spending time herein, and neglecting some compendious course of gathering good, and pursuing vp pence. But when I looke backe to the example of *Plinie*, I must of necessity condemne both mine owne sloth, and also reprove the supine negligence of these daies. A courtiour he was, and great fauourit of the *Vespasians* both father and sonne: an oratour besides, and pleaded many causes at the barre: a martiall man withall, and serued often times a leader and commander in the field: within the citie of Rome hee mannaged civile affaires, and bare honourable offices of State. Who would not thinke but each one of these places would require a whole man? and yet amid these occasions wherewith he was possessed, he penned Chronicles, wrote Commentaries, compiled Grammaticall treatises, and many other volumes which at this day are vtterly lost. As for the Historie of Nature now in hand, which sheweth him to be an excellent Philosopher and a man accomplished in all kinds of literature (the onely monument of his that hath escaped all dangers, and as another *Palladium* beene reserued entire vnto our time) wherein hee hath discoursed of all things euen from the starrie heauen to the centre of the earth; a man would marveile how hee could possibly either write or doe any thing else. But considering the agilitie of mans spirit alwaies in motion: an ardent desire to benefit posteritie, which in these volumes hee hath so often protested; his indefatigable studie both day and night, euen to the iniurie of nature, and the same continued in euerie place, as well abroad as within-house; in his iourney vpon the high way, where his manner was to read and to indite; in his ordinarie passage through the streets betwene court and home, where he gaue himselfe no rest, but either read, or else found his notarie worke to write; and for that purpose rode vsually in an easie litter, with the said Notarie close by his side: lesse wonder it is, that hee performed his service to Prince and state according to his calling; and withall deliuered vnto posteritie so many fruits of wit and learning. For what is not the head of man able to compasse? especially making faile with a seruent desire and resolution to see an end, and besides taking the vantage of all moments, and losing no time, whereof hee was *unus omnium parcissimus*. Touching his affection to search into the secrets of Nature, it was that and nothing else that shortened his daies, and hastened his vntimely death: for hauing liued not much about the middle age of man, desirous he was to know the reason, Why the hill *Nesuvius* burned as it did? and approached so neare, that with the strong vapours and smoake issuing from thence, his breath was suddenly stopped, and himselfe found dead in the place: a man worthie to haue liued for euer. What remaineth now, but onely to recommend vnto my countrimen this worke of his (which for mine owne part I wish to bee immortal) were it not for one scruple to bee cleared, which at the first troubled my selfe a little, and might peraduenture otherwise offend some readers. In attributing so much vnto Nature, *Plinie* seemeth to derogat from the Almighty God, to him *Asymptotus*; and therefore dangerous (saith one) to bee divulged. Farre be it from mee, that I should publish any thing to corrupt mens manners, and much lesse to preiudice Christian religion. After conference therefore with sundrie diuines about this point, whom for their authoritie I reuerence; whose learning I honor and embrace; and in whom for iudgement & synceritie of religion I rest,

The Preface to the Reader.

I rest, confirmed I was in my first purpose, and resolved to finish that which I had begun, namely, not to defraud the world of so rich a gem, for one small blemish appearing therein. And that it may appeare how I did not abound in mine owne sence, but had regard as well to satisfie the conscience of others as mine owne, I haue thought good to annex immediately hereunto, in manner of a Corollarie, the opinion of one graue and learned preacher concerning this doubt, as it was deliuered vnto mee in writing; which for that it is grounded vpon sufficient reasons, and according with the iudgement of the rest, the lesse I respect the rash projects of some fantastickall spirits: nothing doubting but the same will settle the minds of the weake, and free my labours from the taint of irreligion.

THE FIRST BOOKE OF THE
HISTORIE OF NATURE, WRITTEN
BY C. PLINIUS SECVNDVS.

*The Preface or Epistle Dedicatorie to * Prince Vespasian, his [friend]
C. Plinius Secundus sendeth greeting.*

* Titus

Hese bookes containing the Historie of Nature, which a few daies since I brought to light (a new worke in Latine, and namely among the Romanes your Citizens and Countrymen) I purpose by this Epistle of mine to present and consecrate vnto you, most sweet and gentle Prince [for * this title accordeth fittest vnto you, seeing that the name of [* Most mighty] sorteth well with the age of the Emperor your father:] which haply might seeme boldnesse and presumption in me, but that I know how at other times * you were wont to haue some good opinion of my toies and fooleries. Where, by the way, you must giue me leaue to mollifie a little the verses which I borrow of my countryman Catullus. (See also how I light vpon * a word vsed among souldiers, which you are acquainted with, since time we serued both together in the campe:) For he as you wot full well, changing the former syllables of his verses one for another, made himselfe somewhat more harth than he would seeme to be vnto the fine eares of his familiar friends, the Veranioli & Fabullit. And withall, I would be thought by this my malapert writing vnto you, to satisfie one point, which, as you complained in your answer of late to another rude & audacious letter of mine, I had not performed, to wit, That all the world might see (as it were vpon record) how the Empire is managed by you and your father equally: and notwithstanding this imperial majestie wherunto you are called, yet is your affability and maner of conuersing with your old friends, fellow-like, & the same that alwaies heretofore it had been. For albeit you haue triumphed with him for your noble victories, bin Cenfor in your time, and Confull * six times, executed the sacred authoritie of the Tribunes, Patrones, and protectors of the Commons of Rome, together with him: albeit I say you haue otherwise shewed your noble heart in honouring and gracing both the court of the Emperor your father, and also the whole state of Knights and Gentlemen of Rome, whiles you were captaine of the guard, and grand-master of his house and roiall pallace (in which places all, you carried your selfe respectiue to the good of the Commonweale) yet to all your friends, and especially to my selfe, you haue borne the same countenance as in times past within the campe, when wee serued vnder the same colours, and lodged together in one pauilion. So as in all this greatnesse and high estate wherunto you are mounted, there is no other change and alteration seene in your person but this, That your power is now answerable to your will, & able you are to doe and performe that good which you euer meant, and still intend.

And

Plinies Epistle to T. Vespasian.

And howsoever this great maiestie, resplendent in you on euery side, in regard of those high dignities about rehearsed, may induce the whole world besides to reuerence your person in all obeisance; yet I for my part am armed onely with a kinde of audacitie and confidence to shew my dutie and deuoir vnto you, after a more familiar manner than others: and therefore, this my aduenturous rashnes, whatsoeuer, you must impute vnto your own courtesie: and if I chaunce to fault therein, thanke your selfe therefore, and seeke pardon at your own hands. Well, bashfulnesse I haue laid aside, and put on a bold face, and all to no purpose. For why? although your gentlenesse and humanitie be one way attractiue, and induceth me to draw neare vnto your presence, yet another way you appeare in great maiestie: the sublimitie I say of your mind, your deepe reach, high conceit, and rare perfections, set me as far back: no lictors & huishers marching before you, so much, that I dare not approach. In the first place: was there euer any man, whose words passed from him more powerfull, & who more truly might be said to flash forth as lightning the force of eloquence? What Tribune was there known at any time to persuaide & moue the people with good language, more effectually? How admirable was your utterance in those publicke Orations, wherein you thundred out the praise-worthy acts of the Emperour your father, that all the grand-place rung therewith? what a singular testimonie shewed you of rare kindnesse & affection to your brother, in setting out his praises to the full? As for your skill in Poetrie, how excellent, how accomplished is it. Oh the bounty of your mind! Oh the fertility of your pregnant spirit! that you should find means to imitate, yea, and to match your * brother in that kind. But who is able boldly to giue an estimate of these gifts to their worth? How may a man enter into the due consideration thereof, without feare of exquisit censure, and exact iudgement of your wit, especially being prouoked and challenged thereunto as you are. For to say a truth, the case of them who publish a worke in generall tearmes, is farre vnlike to theirs that will seem to dedicat it particularly, and by name, to a Prince so iudicious as your selfe. For had I set forth this my booke simply, and staid there without any personal dedication, the I might haue come vpon you & said, Sir, what should a mightie Commander and Generall of the field, as you are, busie himselfe to read such matters? written these treatises were to the capacitie of the vulgar people, for base commons, rude husbandmen, and peasants of the countrey, for poore artisans; and in one word, to gratifie them who had no other means of great emploiment, nor time & leisure but to studie vpon such points and nothing else: What should you make your selfe a censor of this worke? and verily, when I made first shew of this enterprise of mine, I never reckned you in the number of those iudges that should passe their sentence vpon these writings; I wist full well, that you were a greater person far, & I supposed that you would neuer abase your selfe nor stoupe so low as to read this booke of mine.ouer and besides, a common case it is, and incident to men of deepe learning and great conceit, that otherwhiles exception may be taken against them, and their iudgement reiected in this behalfe. Euen *M. Tullius* that renowned Orator, and who for wit and learning had not his fellow, taking the vantage of that libertie, weth the benefit thereof: and (whereat wee may well maruell) maintaineth the action by an aduocate, and taketh example (for his defence) from *Lucilius*: for in one part of his workes thus hee saith, *I would not haue learned Persius to read these bookes of mine, lest I am that hee should censure mee.*

As

Plinies Epistle to T. Vespasian.

As for *Laelius Decimus*, I am content to submit them to his opinion. Now if such an one as *Lucilius*, who was the first that durst controule the writing of others, and tooke vpon him to scosse at their imperfections, had rather thus to say; if *Cicero* tooke occasion to borrow the said speech of him for to serue his owne turne, and namely in his Treatise of Politiques, where he wrote of a Common-weal; how much greater cause haue I to distrust my self, and to decline and auoid the censure of some iudge of deepe vnderstanding? But cut I am from this refuge and meanes of detence, in that I expressly make choise of you in this dedication of my worke: for one thing it is to haue a iudge, either pricked by pluralitie of voices, or cast vpon a man by drawing lots; and a farre other thing to chuse and nominate him from all others: and great difference there is between that cheare and prouision which we make for a ghest solemnely bidden and invited, and the suddaine fare and intertainment which is ready for a stranger who commeth to our house vnlooked for. *Cato*, that professed enemy of ambition, vaine-glory, and indirect suit for offices, who took as great contentment in those estates and dignities which he refused and reiected, as in them which he enioied, attained to this good name of vprightnesse and sinceritie, that when in the hottest broile about election of Magistrates that euer was in his time, they that stood therefore, put into his hands their mony vpon trust, as a cautionary pawne and assurance of their integritie and fidelitie that way; they professed that they did it in testimony of their conceit of his equitie and innocence, the chiefe and onely thing that a man is to regard in this life: whereupon ensued the noble and memorable exclamation of *M. Cicero*, who speaking of the said *Cato*, brake out into these words: Oh gentle *M. Portius*, how happy and blessed art thou, whom no man was euer so hardie as to sollicite to any leaud thing, or contrary to right and honestie! *L. Scipio*, surnamed *Afiaticus*, at what time as hee appealed vnto the Tribunes of the Commons, and besought their lawfull fauour (among whom, *C. Gracchus* was one, a man whom hee tooke for his mortall enemy) presuming vpon the goodnesse of his cause, gaue out and said, That his very enemies, if they were his iudges, could not chuse but quit him, and giue sentence on his side. Thus wee see how euerie man maketh him peremptorily the supreme and highest iudge of his cause, whom himselfe chuseth and appealeth vnto: which manner of choise the Latines call *Prouocatio*. As for your selfe verily, who are set in the most eminent & chiefe place among men, and otherwise endued with singular eloquence and profound knowledge, no maruell is it, if those that doe their dutie vnto you, salute you, kisse your hand, and come with great respect and reuerence: In which regard, exceeding care about all things would be had, that whatsoeuer is said or dedicated vnto you, may be seem your person, and be worth acceptation. And yet the gods reiect not the humble prayers of poore countrey peasants, yea, and of manie nations, who offer nothing but milke vnto them: and such as haue no Incense, find grace and fauour many times with the oblation of a plaine cake made onely of Meale and salt; and neuer was any man blamed yet for his deuotion to the gods, so he offered according to his abilitie, were the thing neuer so simple.

For mine owne part, challenged I may be more still for this my importune and inconsiderat boldnesse, in that I would seeme to present these bookes vnto you, comprised of so slender stuffe and matter as they be: for therein can be touched no

*For Domitian Vespasian was reputed an excellent Poet.

Plinies Epistle to T. Vespasian.

great wit (which otherwise in me was euer meane and simple) neither admit they any digressions, orations, speeches, and discourses, ne yet admirable cases and variable changes, or any other occurrent, either pleasant to rehearse, or delectable to heare. The truth is this, the nature of all things in this world, that is to say, matters concerning our daily and ordinarie life, are here deciphered and declared, and that in barren terms, without any goodly shew of gay and glorious phrases: and whatsoever I haue put downe, concerne it doth the basest points thereof, inso-much as for the most part I am to deliver the thing in hand, either in rusticall speech, or else in forraine, nay, in barbarous language, such also as may not well be vttered, but with reseruing honour to the hearers, and reuerence to the readers.

Moreouer, the way that I haue entred into, hath not bin troden beforetime by other writers, being indeed so strange and vncouth, as a mans mind would not willingly trauell therein. No Latin author among vs hath hitherto once ventured vpon the same argument, no one Grecian whatsoever hath gone through it and handled all: and no maruell, for many of vs loue not to take any paines, but study rather to pen matters of delight and pleasure. True it is, I must needs say, that others haue made profession hereof, but they haue done it with such subtiltie and deepenesse, that all their trauels and writings by that means, lie as it were dead and buried in darkenesse. Now come I, and take vpon me to speak of euery thing, and to gather as it were a compleat hody of arts and sciences (which the Greeks call *ἐπιστήμη*) that are either altogether vknowne, or become doubtfull, through the ouermuch curiositie of fine wits: again, other matters are deciphered in such long discourses, that they are tedious to the readers, inso-much as they loath and abhor them. A difficult enterprize it is therefore to make old stufte new, to giue authoritie & credit to nouelties, to polish and smooth that which is worne and out of vse, to set a glosse and lustre vpon that which is dim and darke, to grace & countenance things disdained, to procure beleefe to matters doubtful; & in one word, to reduce nature to all, and al to their own nature. And verily to giue the attempt only and shew a desire to effect such a desseigne as this, although the same be not brought about and compassed, were a braue and magnificent enterprize. Certes of this spirit am I, that those learned men and great students, who making no stay, but breaking through all difficulties, haue preferred the profit of posteritie before the tickling and pleasure of itching eares in these daies; which I may protest that I haue aimed at, not in this worke only, but also in other of my bookes already: and I professe, that I wonder much at *T. Livius*, otherwise a most renowned & famous writer, who in a preface to one of his books of the Roman history which hee compiled from the foundation of Rome, thus protested, That hee had gotten glorie ynough by his former writing, and might sit still now & take his ease, but that his mind was so restless, and so ill could abide repose, that contrariwise it was fed and nourished with trauel, & nothing else. But surely me thinks, in finishing those Chronicles, he should in dutie haue respected the glory of that people which had conquered the World, and advanced the honour of the Romane name, rather than displayed his owne praise and commendation: Ywis, his demerit had bene the greater, to haue continued his story as he did, for loue of the subiect matter, and not for his priuat pleasure; to haue I say performed that peece of worke more to gratifie the state of Rome, than to content his owne minde and affection. As touching my selfe (so far as *Domitius Piso* saith, That bookes ought to be

to

Plinies Epistle to T. Vespasian.

treasuries & store houses indeed, and not bare and simple writings) I may be bold to say and averre, That in 36 bookes I haue comprised 20000 things, all worthie of regard & consideration, which I haue recollected out of 2000 volumes or thereabout, that I haue diligently read (and yet very few of them there be that, men learned otherwise, and studious, dare meddle withall, for the deepe matter and hidden secrets therein contained) and those written by 100 seuerall elect and approved authors: besides a world of other matters, which either were vknowne to our forefathers and former writers, or else afterward inuented by their posteritie. And yet I nothing doubt that many things there be, which either surpasse our knowledge, or else our memorie hath ouerslipped: for men we are, and men employed in many affaires. Moreouer, considered it would be, that these studies wee follow at vacant times and stolne houres, that is to say by night season onely; to the end that you may know, how wee to accomplish this haue neglected no time which was due vnto your seruice: The daies we wholly employ and spend in attendance about your person; we sleepe onely to satisfie nature, euen as much as our health requireth, and no more; contenting our selves with this reward, That whiles wee study and muse (as *Varro* saith) vpon these things in our closet, we gaine so many houres to our life; for surely we liue then only, when we watch and be awake. Considering now those occasions, those lets and hinderances aboue-named, I had no reason to presume or promise much; but in that you haue emboldened me to dedicate my bookes vnto you, your selfe performeth whatsoever in me is wanting: not that I trust vpon the goodnesse and worth of the worke, so much, as that by this means it will be better esteemed and shew more vendible: for many things there be that seeme right deare and be holden for precious, only because they are consecrate to some sacred temples.

As for vs verily, we haue written of you all, your father *Vespasian*, your selfe, and your brother *Domitian*, in a large volume which wee compiled touching the historie of our times, beginning there where *Ausidius Bassus* ended. Now if you demand and aske me, Where that historie is? I answer, that finished it was long since, and by this time is iustified and approved true by your deeds: otherwise I was determined to leaue it vnto my heire, and giue order that it should be published after my death, lest in my life time I might haue bin thought to haue curried fauour of those, whose acts I seemed to pen with flatterie, & beyond all truth. And therefore in this action I do both them a great fauour who haply were minded before me to put forth the like Chronicle, and the posteritie also which shall come after; who, I make reckning and know, will enter into the lists with vs, like as we haue done with our predecessors. A sufficient argument of this my good mind & frank hart that way you shal haue by this, That in the front of these books now in hand, I haue set down the very names of those writers, whose help I haue vsed in the compiling of the: for I haue euer bin of this opinion, That it is the part of an honest minded man, & one that is full of grace & modesty, to confesse frankly by whom he hath profited & gotten any good: not as many of those vnthankful persons haue done, whom I haue alledged for my authors. For to tell you a plain truth, know thus much from me, that in conferring the together about this worke of mine, I haue met with some of our moderne writers, who word for word haue exemplified & copied out whole books of old authors, and neuer vouchsafed so much as the naming of them, but haue taken their labors & trauels to themselves.

And

Plinies Epistle to T. Vespasian.

And this they haue not done in that courage and spirit to imitate, yea & to match them, as *Virgil* did *Homer*: much lesse haue they shewed that simplicitie and apert proceeding of *Cicero*, who in his bookes of Policie and Common-weale professeth himselfe to hold with *Plato*; in his Consolatorie Epistle written to his daughter, confesseth and saith plainly thus, I follow *Crantor*, and *Panætius* likewise in his Treatise concerning Offices. Which worthy monuments of his (as you know well) deserue not onely to be seene, handled, and read daily, but also to be learned by heart euery word. Certes, I hold it for a point of a base and seruile mind, and wherein there is no goodnesse at all, to chuse rather to be surprisid and taken in theft, than to bring home borrowed good, or to repay a due debt, especially when the occupying, vse, and interest thereof, hath gained a man as much as the principall.

Now as touching the titles and inscriptions of Bookes, the Greekes therein haue a wonderfull grace and great felicitie: some haue intituled them *Καμιν*, whereby they would giue vs to vnderstand of A sweet hony-combe: others *Κρη Αποδεσκα*, that is to say, The horne of plenty and store: in such sort, that whosoever readeth these goodly titles, must needs hope for some great matters in such bookes, and as the proverb goeth, looke to drinke there or else no where, a good draught of hens milke. You shall haue moreouer their bookes set out with these glorious inscriptions, The Muses, The * Pandects, * Enchiridion, * *Αμυν*, * *Παραδιδω*: Goodly names all, and such, as who would not make default of appearance in court, and forfeit a recognisance or obligation, to vnclaspe such bookes and turne over the leafe? But let a man enter into them and reade forward, Lord! how little or no substance at all shall he find within the verie mids, answerable to that braue shew in the front or outside thereof? As for our countrey men (Latines I meane, and Romans) they be nothing so fine and curious as the Greekes, grosse are they in comparison of them in giuing titles to their bookes: they come with their Antiquities, Examples and Arts, and those also be such authors as are of the most pleasant and finest inuention amongst them all. *Valerius* who (as I take it) was named *Antias*, both for that hee was a Citizen of Antium, and also because the ancestors of his house were so called, vvas the first that gaue to a booke of his owne making, the title of *Lucubratio*, as a man would say, Candleworke or Night-studie. *Varro*, he tearmeth some of his Satyres *Sesquialyxes* and *Flexibula*. *Diodorus* among the Greekes was the first that laied aside roiysh titles, and because he would giue some braue name to his Chronicles, entituled it *Bibliotheca*, i. a Librarie. *Apion* the famous Grammarian, euen hee whom *Tiberius Cæsar* called the Cymball of the world (whereas indeed hee deserued to be named a Timbrill or Drum rather, for ringing and sounding publique fame) was so vain-glorious, that he supposed all those immortalized, vnto whom hee wrote or composed any pamphlet whatsoever. For mine owne part, although I nothing repent mee that I haue deuised no pretier Title for my Booke than plaine *Naturalis Historia*, i. The reports of Nature, without more ceremonie; yet because I would not be thought altogether to cource and rate the Greekes, I can be content, nay I am willing to bee thought in this behalfe like vnto those excellent grand masters in Greeke, for Painting and Imagerie, whom you shall finde in these Reports of mine, to haue entituled those rare and absolute peeces of worke (vvhich the more wee view and looke vpon, the more wee admire and wonder

Plinies Epistle to T. Vespasian.

wonder at for their perfection) with halfe titles and vnperfect inscriptions, in this manner, *Apelles* * *went in hand with this Picture*: or, *Polycletus was a making this Image*: as if they were but begun, neuer finished and laid out of their hands: which was done (no doubt) to this end, that for all the varietie and diuersitie of mens iudgements scanning of their workmanship, yet the Artificer thereby had recourse to make excuse; had meanes (I say) to craue and haue pardon for any faults and imperfections that could be found, as if hee meant to haue amended any thing therein amisse or wanting, in case hee had not bene cut off and preuented by death. These noble workemen therefore herein shewed right great modestie, that they set superscriptions vpon all their painted tables, portraictures and personages, as if they had bene the last peeces of their workmanship, and themselues disabled by vnexpected death that they could not make a finall end of any one of them: for there were not knowne (as I take it) aboue three in all, which had their absolute titles written vpon them in this forme, *Ille fecit*, i. This *Apelles* wrought: and those pictures will I write of in place conuenient: By which it appeared euidently, that the said three tables were fully finished, and that the workeman was so highly contented with their perfection, that he feared the censure of no man: No maruaile then, if all three were so much enuied and admired throughout the world, no marueile if euerie man desired to be master of them.

Now For my selfe, I know full well and confesse freely, that many more things may be added, not to this story alone, but to all my bookes that I haue put forth alreadie: which I speake by the way, because I would preuent and auoid those faule-finders abroad those correctors and * scourgers of *Homer*, (for surely that is their very name (because I hear say there be certaine Stoike Philosophers, professed Logicians, yea, and Epicurians also (for at Grammarians hands and Criticks I neuer looked for other) who are with child full and trauaile vntill they be deliuered of somewhat against my bookes which I haue set forth as touching Grammer: and for this ten yeares space, nothing is come to light, but euermore the fruit miscarieth belike before the full time, as the slip of an vnperfect birth; whereas in lesse space than so, the verie Elephant bringeth forth her calfe, be it neuer so big. But this troubleth me neuer a whit, for I am not ignorant that a silly woman, euen an harlot, and no better, durst encounter *Theophrastus*, and write a booke against him, notwithstanding hee was a man of such incomparable eloquence that thereupon hee came by his diuine name *Theophrastus*: from whence arose this prouerbe and by-word, * *Marie then go chuse a tree to hang thy selfe*. And surely I cannot containe and hold my tongue, but I must needs set downe the verie words of *Cato Censorius*, so pertinent to this purpose; whereby it may appeare, that euen *Cato* himselfe a most worthy personage, who wrote of militarie Discipline, who had bene brought vp and trained to feats of warre vnder Great *Scipio Africanus*, or rather indeed vnder *Anniball*, who in the end could not endure *Africanus* himselfe, but was able to controll him in martiall affaires: and who besides hauing the conduct as L. Generall of the Romane armie, atchieued the better hand ouer his enemies in the field, and returned with victorie: this *Cato* (I say) could not auoid such backbiters and slanderers, but knowing that there would be many of them readie to purchase themselues some name and reputation by reprouing the knowledge and skill of others, brake out into a cer-

a cer

Plinies Epistle to T. Vespasian.

a certaine speech against them: And what was it? I know right well (quoth hee, in that booke aforesaid) that if these writings of mine come abroad once and be published to the view of the world, there will be many step forth to quarrell and caull therewith; such fellows soonest and most of all who are quite void of vertue and honestie, and know not what belongeth to true honour. But surely say what they will, I let their words runne by, like raine water. It was a prettie speech also and a pleasant apothegme, that *Plancus* uttered in the semblable case: for being informed that *Asinius Pollio* was deuising and framing certaine inuestiue Orations against him, which should be set forth either by himselfe or his children, after the decease of *Plancus* and not before, to the end that they might not bee answered by him; hee said readily by way of a scoffe, That none but vaine bugs and hobgoblins vse to fight with the dead: with which word hee gaue those orations such a counterbuffe, that (by the iudgement of the learned) none were accounted afterward more impudent and shamelesse than they. For mine owne part, being sure that these busie bodies shall neuer be able to bite me (and verily *Cato* hath giuen such fellows a proper name, and called them *Vitiligatores*, by a tearme elegantly compounded of vices and quarrels: for to say a truth, what did they else but picke quarrels and make brawls?) I will proceed and go one still in my intended purpose.

Now to conclude and knit vp mine Epistle: knowing as I doe, that for the good of the Commonweale, you should be spared and not impeached by any priuat businesse of your owne, and namely in perusing these long volumes of mine; to preuent this trouble therefore, I haue adioyned immediatly io this Epistle, and prefixed before these books, the Summarie or Contents of euery one: and very carefully haue I endeauoured, that you should not need to read them throughout, whereby all others also after your example, may ease themselves of the like labour: and as any man is desirous to know this or that, he may seeke and readily find in what place to meet with the same. This learned I of *Valerius Sorranus* one of our owne Latine writers, who hath done the

like before me and set an Index to these Bookes which
he entituled *Index*.

THE INVENTORIE OR INDEX
CONTAINING THE CONTENTS OF XXXVII
BOOKS, TOVCHING THE HISTORIE OF NA-
TURE, WRITTEN BY C. PLINIVS SECVNDVS, WHICH IS RECEI-
VED FOR THE FIRST BOOKE OF THEM.

¶ *The Summarie of euery Booke.*

He first Booke containeth the Dedicatorie Epistle or Preface of the whole worke, addressed to *Titus Vespasian* the Emperour. Also the names of the Authors out of which hee gathered the Historie, which he prosecuted in 36 Bookes: together with the Summarie of euery Chapter: and beginneth, *The Books, &c.*

The second, treateth of the World, Elements, and Starres: and beginneth thus, *The World, &c.*

The third, describeth the first and second gulse, which the Mediterranean sea maketh in Europe: and beginneth in this manner, *Hitherto, &c.*

The fourth, compriseth the third gulse of Europe, beginning, *The third, &c.*

The fifth, containeth the description of Affricke, and beginneth thus, *Africke, &c.*

The sixt, handleth the Cosmographie of Asia, beginning thus, *The sea called, &c.*

The seuenth treateth of man, and his inuentions, beginning, *Thus as you see, &c.*

The eighth sheweth vnto vs, land creatures and their kindes, and beginneth after this manner, *Passé we now, &c.*

The ninth, laieth before vs all fishes, and creatures of the water, beginning in this wise, *I haue thus shewed, &c.*

The tenth speakes of flying foules and birds, and beginneth thus, *It followeth, &c.*

The eleuenth telleth vs of Insects, and beginneth thus, *It remaineth now, &c.*

The twelfth treateth of drugs and odoriferous plants, beginning, *Thus you, &c.*

The thirteenth describeth strange and forreine trees: beginning with these words, *Thus farre forth, &c.*

The fourteenth sheweth of vine-plants, &c. beginning thus, *Thus far forth, &c.*

The fifteenth comprehendeth all fruitfull trees, thus beginning, *There were, &c.*

The sixteenth describeth vnto vs all wild trees, beginning with, *Hitherto, &c.*

The seuenteenth containeth tame trees within hortyards, and beginneth with these words, *As touching the nature, &c.*

The eighteenth booke treateth of the nature of corne, and all sorts thereof, together with the protection of husbandmen, and agriculture, beginning after this manner, *Now followeth, &c.*

The

The first Booke of

The nineteenth discourseth of Flax, Spart, and Gardenage, beginning after this manner, *In the former booke, &c.*
 The twentieth sheweth of garden herbs, good to serue both the kitchin for meat, and the Apothecaries shop for medicine, & beginneth thus, *Now will we, &c.*
 The one and twentieth treateth of flours and garlands, & beginneth, *In Cato, &c.*
 The two and twenty containeth the chaplets and medicines made of hearbes, with this beginning, *Such is the perfection, &c.*
 The three and twentie sheweth the medicinable vertues of wine, and tame trees growing in hortyards, beginning thus, *Thus haue we, &c.*
 The foure and twentie declareth the properties of wild trees seruing in Physick, beginning thus, *Nature, &c.*
 The fife and twentie treateth of the herbes in the field comming vp of their own accord, and thus beginneth, *The excellencie, &c.*
 The six and twentie sheweth of many new and strange maladies, the medicinable vertues also of certaine herbes, according to sundry diseases, beginning thus, *The very face, &c.*
 The seuen and twenty goeth forward to certaine other hearbes and their medicines, and thus beginneth. *Certes, &c.*
 The eight and twentie setteth downe certaine receits of remedies in Physicke, drawne from out of man and other bigger creatures, and it beginneth in this manner, *Heretofore, &c.*
 The nine and twentie treateth of the first authours and inuentors of Physicke, also of medicines taken from other creatures, and beginneth, *The nature, &c.*
 The thirtieth booke speaketh of Magicke, and certaine medicines appropriat to the parts and members of mans bodie, beginning thus, *The vanitie, &c.*
 The one and thirtie containeth the medicinable vertues of fishes and water creatures, with this beginning, *Now follow, &c.*
 The two and thirtie sheweth other properties of fishes, &c. and beginneth in this manner, *Now are we come, &c.*
 The three and thirtie treateth of gold and siluer mines, and hath this beginning, *Time it is, &c.*
 The foure and thirtie speaketh of copper and brasse mines, also of lead, also of excellent brasse-founders and workemen in copper, beginning after this manner, *In the next place, &c.*
 The fife and thirtie discourseth of painting, colour, and painters, beginning in this sort, *The discourse, &c.*
 The six and thirtie treateth of marble and stone for building, and hath this beginning, *It remaineth, &c.*
 The seuen and thirtie concludeth with pretious stones, and beginneth at these words, *To the end that, &c.*

¶ IN

Plinies Naturall History.

¶ IN THE SECOND BOOKE IS CONTAINED
 the discourse of the World, of coelestiall impressions and meteors,
as also of them that appeare in the Aire, and upon Earth.

- | | |
|--|---|
| <p><i>Chap.</i>
 1. Whether the World be finite and limited within certaine dimensions or no? whether there be many, or but one?
 2. The forme and figure of Heauen and the world.
 3. The motion of Heauen.
 4. Why the world is called Mundus?
 5. Of the Elements.
 6. Of the seuen Planets.
 7. Concerning God.
 8. The nature of the fixed starres and Planets: their course and reuolution.
 9. The nature of the Moone.
 10. The eclipse of Sun and Moone: also of the night.
 11. The bignesse of starres.
 12. Diuerse inuentions of men, and their obseruations touching the coelestiall bodies.
 13. Of Eclipses.
 14. The motion of the Moone.
 15. Generall rules or canons touching planets or lights.
 16. The reason why the same planets seeme higher or lower at sundry times.
 17. Generall rules concerning the planets or wandring stars.
 18. What is the cause that planets change their colours?
 19. The course of the Sunne: his motion: and from whence proceedeth the inequalitye of daies.
 20. Why lightnings be assigned to <i>Iupiter</i>.
 21. The distances betweene the planets.
 22. The harmonie of stars and planets.
 23. The geometrie and dimensions of the world.
 24. Of stars appearing sodainly.
 25. Of comets or blasing stars, and other prodigious appearances in the skie: their nature, situation, and sundry kinds.
 26. The opinion of <i>Hipparchus</i> the Philosopher as touching the stars, fire-lights, lamps, pillars or beames of fire, burning darts, gapings</p> | <p><i>Chap.</i>
 of the skie, and other such impressions, by way of example.
 27. Strange colours appearing in the firmament.
 28. Flames and leams seene in the skie.
 29. Circles of guirlands (shewing aboue).
 30. Of coelestiall circles and guirlands that continue not, but soone passe.
 31. Of many Suns.
 32. Of many Moones.
 33. Of nights as light as day.
 34. Of meteors resembling fierie targuets.
 35. A strange and wonderfull apparition in the skie.
 36. The extraordinarie shooting and motion of stars.
 37. Of the stars named <i>Castor</i> and <i>Pollux</i>.
 38. Of the Aire.
 39. Of certaine set times and seasons.
 40. The power of the Dog-star.
 41. The sundrie influences of stars according to the seasons and degrees of the signes.
 42. The causes of raine, wind, and clouds.
 43. Of thunder and lightning.
 44. Whereupon cometh the redoubling of the voice, called <i>Echo</i>.
 45. Of winds againe.
 46. Diuerse considerations obserued in the nature of winds.
 47. Many sorts of winds.
 48. Of sodaine blasts and whirle-puffs.
 49. Other strange kinds of tempests & storms.
 50. In what regions there fall thunderbolts.
 51. Diuers sorts of lightnings, and wonderous accidents by them occasioned.
 52. The obseruations [of the <i>Tuscans</i> in old time] as touching lightening.
 53. Conjuring for to raise lightning.
 54. Generall rules concerning leames and flashes of lightning.
 55. What things be exempt and secured from lightning and thunderbolts.
 56. Of monstrous and prodigious showres of raine,</p> |
|--|---|

The first Booke of

Chap.

1. raine, namely of milke, bloud, flesh, yron, wooll, bricke, and tyle.
2. The rattling of harnesse and armour: the sound also of trumpets heard from heauen.
3. Of stones falling from heauen.
4. Of the Rain-bow.
5. Of Haile, Snow, frost, Mists, and Dew.
6. Of diuers formes and shapes represented in clouds.
7. The particular propertie of the skie in certaine places.
8. The nature of the Earth.
9. The forme and figure of the earth.
10. Of the Antipodes: and whether there bee any such. Also, as touching the roundnesse of the water.
11. How the water resteth vpon the Earth.
12. Of Seas and riuers nauigable.
13. What parts of the earth be habitable.
14. That the earth is in the mids of the world.
15. From whence proceedeth the inequality obserued in the rising and eleuation of the stars. Of the eclipse: where it is, & wherefore.
16. The reason of the day-light vpon earth.
17. A discourse thereof according to the Gnomon: also of the first Sun-diall.
18. In what places and at what times there are no shadows cast.
19. Where the shadows fall opposite and contrary twice in the yeare.
20. Where the dayes bee longest, and where shortest.
21. Likewise of Dyals and Quadrants.
22. The diuers obseruations and acceptations of the day.
23. The diuersities of regions, and the reason thereof.
24. Of Earthquakes.
25. Of the chinks and openists of the earth.
26. Signes of earthquake toward.
27. Remedies and helps againg earthquakes comming.
28. Strange and prodigious wonders seen one time in the earth.
29. Miraculous accidents as touching earthquake.

In sum, there are in this booke of histories, notable matters, and worthy obseruations, foure hundred and eightene in number.

Latine Authours cited.

M. Varro, Sulpitius Gallus, Tiberius Caesar Emperour, Q. Tubero, Tullius Tiro, L. Piso, T. Livius, Cornelius Nepos, Statius Sebosus, Cassius Antipater, Fabianus, Antias, Mutianus, Cecina, (who wrote of the Tuscan learning) Targitius, L. Aquila, and Sergius Paulus.

Forreine

Chap.

1. In what parts the seas went backe.
2. Islands appearing new out of the sea.
3. What Islands haue thus shewed, and at what times.
4. Into what lands the seas haue broken perforce.
5. What Islands haue bin ioyned to the continent.
6. What lands haue perished by water and become all sea.
7. Of lands that haue settled and bene swallowed vp of themselves.
8. What cities haue bene overflowed and drowned by the sea.
9. Wonderful strange things as touching some lands.
10. Of certaine lands that alwaies suffer earthquake.
11. Of Islands that flete continually.
12. In what countries of the world it never raineth: also of many miracles as well of the earth as other elements hudled vp pell mell together.
13. The reason of the Sea-tides, as well ebbing as flowing, and where the sea floweth extraordinarily.
14. Wonderful things obserued in the sea.
15. The power of the Moone ouer Sea and land.
16. The power of the Sun: and the reason why the sea is salt.
17. Moreouer, as touching the nature of the Moone.
18. Where the sea is deepest.
19. Admirable obseruations in fresh waters, as well of fountaines as riuers.
20. Admirable things as touching fire and water ioyned together: also of Maltha.
21. Of Naphtha.
22. Of certaine places that burne continually.
23. Wonders of fire alone.
24. The dimension of the earth as well in length as in breadth.
25. The harmonick circuit and circumference of the world.

Plinies Naturall Historie

14. Of the bird Clivina.
15. Of many birds vnknowne.
16. Of foules that flie by night.
17. Of Howlets.
18. Of the Wood-pecker.
19. Of birds which haue clawes and crooked tallons.
20. Of Peacockes: and who killed them first for to be ferued at the table.
21. Of Cockes: how they be cut: of a dunghill cocke that fpake.
22. Of Geese: who first deuifed to make a daintie difh of the Goofe liuer: the graue or fat of Geefe, called Comagenum.
23. Of Cranes, Storkes, Swans, strange foules of outlandifh countries, of Quailles, and the bird Glotis.
24. Of Swallowes and Martins, of Blackbirds, Thrufhes and Merles, of Sterlings, Turtle-doues, and Quoifts or Ring-doues.
25. Of birds that tarie with vs all the yere long

Chap.

- of birds that be for halfe a yere onely, and others that remaine but three moneths.
26. Marvellous ftories of birds.
 27. Of birds called Seleucides.
 28. Of the foule Ibis.
 29. What birds will not abide in all places: which they be that change both hew and voice: alfo of Nightingales.
 30. Of Merles or Oufels.
 31. The time wherein birds breed, lay, and fit.
 32. Of the birds Halciones, the nauigable daies that they doe fheue: of the Sea-gulls and Cormorants.
 33. The induftry and subtilty of birds in building their nefts: of the ordinary Swallow, the riuier Swallow Argatilis: the bird Cinnamonologie that fteale Cinnamon, and of Partridges.
 34. Of Houfe-doues.
 35. Of Stock-doues.
 36. Of Sparrowes.
 37. Of the Kestrell or Stannell.
 38. Of the flight and gate of birds.
 39. Of certaine footleffe Martinets, called Apodes.
 40. Of certain Gulls that milk and fuck Goats vdders, and be named Caprimulgi: alfo of Pelicanes named Plateæ.
 41. The perceiuance and naturall wit of birds.
 42. Of the Linner, Popinjay, or Parret, and fuch birds that will learne to fpake.
 43. The intelligence and vnderftanding that Rauens haue.
 44. Of Diomedes his birds.
 45. Of dull witted birds that will be taught nothing.
 46. The manner how birds drinke.
 47. Of foules called Himantipodes, and Onacrotali, and of other fuch strange birds.

48. The

Plinies Naturall Hiftory.

Chap.

48. The names of many birds, & their natures.
49. Of ftrange and new birds, fuch alfo as bee holden for fabulouſ.
50. Who deuifed firſt to cram hens & capons, of bartons, mewes, and coupes to keepe and feed foules: and the firſt inuentor thereof.
51. Of *Aſſopes* platter.
52. The generation of birds, and what four-footed beaſts do lay eggs as well as birds.
53. The knitting of eggs within the body, the laying, couuing and fitting of them, the maner and time of birds engendering.
54. The accidents that befall to broodie birds whiles they fit, and the remedies thereof.
55. Auguries and preſages by egges.
56. What Hens be of the beſt kind.
57. The diſeaſes incident to Hens & the cure.
58. The maner how birds conceiue: what number of eggs they lay, & how many they hatch
59. Of Peacockes and Geefe.
60. Of Herons and Bitters. The way to preſerue and keepe egges.
61. The only bird that bringeth forth her yong aliue, & feeds the ſame at the pap with milk

Chap.

62. The conception of the Viper, and how ſhe is deliuered of her young, alſo, what land creatures lay egges.
63. The ordinary generation of land creatures.
64. The diuerſitie of liuing creatures in the maner of their engendering.
65. The yong ones that mice and rats do breed
66. Whether of the marrow of a mans backe bone a ſerpent will engender.
67. Of the Salamander.
68. What things bee engendered of thoſe that were neuer engendered, and contrariwiſe, what creatures they be, which being engendered themſelues, breed not.
69. The fences of liuing creatures.
70. That fiſhes doe both heare and ſmell.
71. That the ſence of feeling is common to all liuing creatures.
72. What creatures liue of poyſons, and eat earth.
73. Of the meat and drink of diuers creatures.
74. What creatures evermore diſagree: and which they be that agree well together.
75. Of the ſleepe of liuing creatures.

This booke hath in it of notable matters, hiftories and obſeruations 904, gathered out of

Latine Authors and records.

Manilius, Cornelius Valerianus, the publike records and registers, Vmbritius ſurnamed Melior, Maſſurius Sabinus, Antiſtius Labeo, Trognus Cremutius, M. Varro, Macer Amylius, Meliſſes, Mutianus, Nepos, Fabius Piclor, T. Lucretius, Cornelius Celſus, Horatius, Deſulo, Hyſſignus, Sarſenna, both father and ſonne, Nigidius and Manlius Sura.

Forreine Writers.

Homer, Phamones, Philemon, Boethius who wrote a treatiſe called Ornithagonia, Hylas who made a diſcourſe of Auguries, Aristotle, Theophrastus, Callimachus, Aſchylus, Hiero, Philometor, Archytas, Amphilocheus the Athenian, Anaxipolis the Thafian, Apollodorus of Lemnos, Ariſtophanes the Mileſian, Antigonus the Cymæan, Agathocles of Chios, Apollonius of Pergamus, Ariſtander the Athenian, Bacchius the Mileſian, Bion of Soli, Chereas the Athenian, Diodorus of Pryæne, Dion the Colophonian, Democritus, Diophanes of Nicæa, Epigenes of Rhodes, Evagoras of Thafos, Euphoniſ of Athens, king Iuba, Androcion who wrote of Huſbandrie, and Aſcrion likewiſe who wrote thereof, Dionyſius who tranſlated Mago, and Diophanes, who reduced his worke into an Epitome, Nicander, Oneſicritus, Philarchus, and Heſiodus.

¶ IN THE ELEVENTH BOOKE ARE CONTAINED the ſtories and natures of ſmall creatures and ſuch as creepe on the ground.

Chap.

1. Of Inſects in generall.
2. The naturall induſtrie of thoſe Inſects.
3. Whether Inſects doe breath, and whether they haue bloudor no.

Chap.

4. The matter & ſubſtance of the Inſects body.
5. Of Bees.
6. The government and order which Bees keep by inſtinct of Nature.

b

7. Diuers

The first Booke of

Chap.

7. Diuers operations of the Bees, & the tearmes thereto belonging.
8. Of what floures Bees do make their cellars, combs, and other workes.
9. What persons tooke a great loue to Bees, and delighted to nourish them.
10. The manner of Bees when they be at their businesse.
11. Of Drones.
12. The nature of Honey.
13. Which is the best Honey.
14. The seuerall and particular kinds of Hony in diuerse places.
15. The markes and tokens of good Honey.
16. Of a third kind of Honey, and how a man should know good Bees.
17. The regiment and policie that Bees obserue.
18. Diuerse sorts of Bees, and what things be hurtfull to Bees.
19. The diseases incident to Bees.
20. How to keepe the cast of Bees when they swarme, that they flie not away, also how to recover Bees, in case their breed and race be lost.
21. Of Wespes and Hornets.

11. The manner of making and laying leaven: also of making past & bread: and when Bakers were first knowne at Rome. Of sieves, serces, and bulsters; and of foddren wheat or frumentie.
12. Of pulfe.
13. Of Rapes and Navewes in the Amiternine tract.
14. Of Lupines.
15. Of Vetches and Ervile.
16. Of Fenigreeke: of Messelline or dredge-corne: of Mung-corne or Bollimong for provander: of Clauer or three-leaved grassie

Chap.

- called Medica, and of another Trefoile named Cytisus.
17. The faults and diseases in corne, graine, and pulfe, and their remedies: what corne or pulfe ought to be sowne with respect to the ground.
18. Of prodigious tokens obserued in corne. The skill of ploughing the ground: the diuers sorts of culcers & shares in the plough.
19. The seasons of the yere fit to till & plough the ground. The manner of putting oxen in the yoke for the plough.
20. Of breaking clods or harrowing: of another kinde of tilling: the earing or second tilth or stirring the ground. And cutting the corne.
21. The manner of tilling and husbanding land.
22. Examples of diuers grounds: of such as are wondrous fertile: of a vine that beareth grapes twice in the yere. The difference of waters.
23. The qualitie of the ground or soile: of compost or dunging lands.
24. The goodnesse of choise seeds: the manner of good sowing: how much seed of any corn an acre will take to be well sowne. The seasons of seednesse.
25. The obseruation of the stars for their apparition or occultation, their rising and setting, as well for day as night.
26. A recapitulation and brieffe summarie of all things belonging to husbandrie. What is to bee done in the field euery moneth of the yere.
27. That husbandmen should not so much regard the signe or the stars, as the fit season of the time for seednes. The rising or fall, the apparition or occultation of planetes obserued in some hearbes. Of the rising and setting of stars.
28. Of meadows: how they are to be repaired and

The first Booke of

Chap.

- and brought into hart: of sith-stones, hooks, sickles, and sithes: the time of sowing corne, and what fixed starres are of power about that time.
29. Of the seasons and times to be marked as well in summer as winter: what remedy for barraine and leane ground.
30. Of the haruest: of wheat, of chaffe: how to keepe corne.

Chap.

31. Of vintage, and autumn, and the constitution thereof.
32. What regard is to be had in the moon and her age, in husbandrie. (ture.)
33. The consideration of the winds for agricul
34. The bounds, limits, bawks, and waies, to be obserued in cornfields.
35. Signes whereby a man may prognosticate the disposition of the weather.

In summe, there be contained in this booke of notable matters, stories, and obseruations, two thousand and six hundred.

Latine Authors alledged in this booke.

Massurius Sabinus, Cassius Hemina, Verrius Flaccus, L. Piso, Cornelius Celsus, Turannius Graccula, D. Syllanus, M. Varro, Cato Censorius, Scrofa, Sarsenna both father and sonne, Domitius Calvinus, Hyginus, Virgil, Trogus, Ouid, Gracinus, Columella, Tubero, L. Aruntius who wrote in Greeke of Astronomie, and *Cesar Dictator* who likewise wrote of the same argument, *Sergius Paulus, Sabinus Fabianus, M. Cicero, Calphurnius Bassus, Atteius Capito, Manlius Sura*, and *Aetius* who compiled a booke called *Praxidica*.

Forreine Authors.

Hesiodus, Theophrastus, Aristotle, Democritus, K. Hiero, K. Philometor, K. Attalus, K. Archelaus, Archytas, Xenophon, Amphilocheus of Athens, Anaxipolis of Thafus, Aristophanes the Milesian, Apollodorus the Lemnian, Antigonus the Cymæan, Agathocles of Chios Apollonius of Pergamus, Aristander the Athenian, Bacchius the Milesian, Bion of Soli, Chærea of Athens, Charisius likewise the Athenian, Diodorus of Priene, Dion of Colophon, Epigenes of Rhodes, Evagoras the Thasian, Euphronius the Athenian, Andraton, Alchbrio, and Lyfimachus, who wrote all three of Husbandrie, *Dionysius* that translated the works of *Mago*, and *Diophanes* who drew the same into an Epitome, *Thales, Eudoxus, Philippus, Callippus, Dositheus, Permeniscus, Meliton, Criton, Oenopides, Zeno, Eudæmon, Harpalus, Hecæus, Anaximander, Sosigenes, Hipparchus, Aratus, Zoroa fides*, and *Archibius*.

THE NINETEENTH BOOKE CONTAINETH a discourse of the nature of Flax, and other wonderfull matters.

Chap.

1. The sowing of Line seed: diuers kinds of flax: how it is dressed: of naperie & napkins: of linnen that will not burne nor consume with fire: and when curtains were deuised at Rome about the theatres.
2. The nature of a kind of broom called Spart, when it came to be vsed first, how it is to be ordered & dressed, what plants both spring and also liue without roots.

In summe, here are comprised memorable things, stories, and obseruations, a thousand one hundred fortie and three.

Latine Authours cited.

M. Aetius Plantus, M. Varro, D. Syllanus, Cato Censorius, Hyginus, Virgil, Mutianus, Celsus, Columella, Calphurnius Bassus, Manlius Sura, Sabinus Tyro, Licinius Macer, Q. Hirtius, Vibius Rufus, Censorinus who wrote *Seipura*, [i. a treatise of Gardening] *Castritius* likewise, and *Firminus*, (who both twaine made a worke of the same matter) and last of all *Petreus*.

Forreine Writers.

Herodotus, Theophrastus, Democritus, Aristomachus, Menander, (who wrote a booke intituled *Brochreita*, i. of things profitable for our life and diet) and *Anaxilaus*.

THE TWENTIETH BOOKE COMRISETH medicines out of those Simples which are set and sowed in Gardens.

Chap.

1. Of the wild Cucumber, and the juice therof *Elaeterium*.
2. Of the Cucumber as wel that which wande- reth & groweth abroad called *Anguinum*, as that of the garden: also of the *Pompon*.
3. Of the wild gourds, and the Rape or Naves.
4. Diuers sorts of Naves: of the wild Radish, of the garden Radish, and the Parsnep or Carot.
5. Of *Staphylinum* or the tame Parsnip. The herbe *Gingidium* or *Chervill*: of *Sefelis* or *Siler*: mountaine: of *Elecampane*, and of *Onyons*.
6. Of *Porret* or *Leekes* vsed to be cut, and of cabbage *Leeks* or headed, also of *Garlick*.
7. Of wild Lettuce or Hawke-weed, called also *La Stuca Caprina*, of another kinde named *Efopus*, of Wood, & tame garden Lettuce.
8. Diuerse kindes of Beets, of *Endive*, and *Cichorie*, of garden *Endiue*.
9. Of *Cawle* or *Coleworts*, of the wild *Coleworts* *Lapana*, of *Soldanella*, of *Squilla* or the Sea-onion, of *Scallions* or *Chibbols*, and of *Dog-leeks*.
10. Of *Sparage* both tame and wild, of *Libycum* and *Clarie*.
11. Of *Parsley*, of *Baulme*, *Smallage*, & mountaine *Parsley*.
12. Of *Alifanders*, and garden *Basill*.

Chap.

13. Of wild *Basill*, of *Rocket*, of *Cresses*, and *Rue*.
14. Of wild Mints, of garden Mints, of *Peniroyall*, of *Nep*, and *Cumin*.
15. Of *Ethiopian Cumin*, which staieth vrine, of *Capers*, of *Lovach*, of *Panace*, of wild *Origan* or *Majoram* savage.
16. More of wild *Origan* and *Heracleorica*, called also *Gallinacca Cunila*, i. Small *majoram*, *Saviorie* or *Orgament*, *Rosemarie*, sweet *Majoram* of the garden and of the mountaine.
17. Of *Cockweed*, *Pepperwort*, or *Dittander*, of garden *Origan*, of a kinde of *Orgament* called *Onitis* of *Prason*, of *Tragoriganum* or wild *Peniroyall*, the water *Lillie* or *Nenuphar*, of *Lepidium*, of *Gith* or *Nigella Romana*, and of *Anise*.
18. Of *Dill*, of *Sacopanium*, of *Sagapen*, of *Poppies* both white and blacke: the manner how to draw the juice of herbes: and of *Opium*.
19. Of the wild *Poppie*, of horned *Poppie*, of *Glaucium* or *Paralium*, of *Heracleum* or *Aphrum*, of the confection *Diacodium* made of *Poppie* heads, of *Tythimall*.
20. Of *Purcellane* or *Peplium*, of *Coriander* and *Orach*.
21. Of *Mallowes*, and *Malope*, of *Althæa* or *Marsh*.

The first Booke of

Chap.

1. Marshmallow, of Dockes, foure Docke or Sorell, the water Docke, the herbe Patience or Bulapathum.
2. Three kindes of Senvie, of Horehound, of running Thyme, of water Mints or Savorie, of Linseed and Bleets.

In summe, there be comprised in this booke of medicines, stories, and obseruations, one hundred sixtie and seven.

Out of Latine Authors.

Cato Censorius, Mar. Varro, Pompeius Lenax, Gallio, Hyginus, Sextius Niger who wrote in Greeke, and *Iulius Bassus* likewise, who wrote in the same language, *Celsus*, and *Antonius Casar*.

Forreine Authours.

Democritus, Theophrastus, Orpheus, Menander who made the booke *Biochresta*, *Pythagoras*, and *Nicander*.

Out of Physicians.

Nicander, Hippocrates, Chrysippus, Diocles, Ophion, Heraclides, Hicestus, Dionysius, Apollodorus of Tarentum, *Apollodorus* the Citien, *Praxagoras, Philistonicus, Medius, Diensch, Cleophrantus, Philistio, Asclepiades, Crateuas, Petronius, Diodorus, Iolla, Erasistratus, Diagoras, Andreas, Mnesicles, Epicharmus, Damion, Dalion, Sosimenes, Theopolemus, Metrodorus, Solon, Lycus, Olympiades* of Thebes, *Phyllinus, Petreius, Mithon, Glaucia* and *Xenocrates*.

* A woman who was a Midwife.

IN THE XXI. BOOKE ARE CONTAINED the natures of Floures and Hearbs to make Guirlands of.

Chap.

1. The nature of floures and herbes that serve for Chaplets, the wonderfull varietie of floures.
2. Of Chaplets and nosagaies of floures, Who first deuised to set floures in order one with another. When Coronets or Guirlands of floures were inuented and took their name, and vpon what occasion.

17. The difference of many sorts of herbes in their lease. Which they be that doe floure all the yeere long, of the Daffodill, of Mustana, and of the Gladen or Sword-grasse.
18. Of diuers sorts of Reeds, and of Cyperus, of the medicinable vertues which they haue, of Cypirus, and Squinanth.
19. The medicinable vertues of Roses, of the Lillie, of Narcissus, of the Violet, and of Baccharis or Ladies gloues, of Combretum and Asarabacca.
20. Of Nard Celticke and Saffron, the vertues thereof and vse in Physicke, of the sweet ointment Crocomagma made of Saffron,

Chap.

- of Spike or Lauender, of Polium, and Flourelis, of Heliochrysum, Chrysome, and Melilot.
21. Of sweet Trifolie, of Thyme, the wild yellow Lillie Hemerocallis or the day-floure, of Elecampane and Sothernwood.
22. the medicinable vertues of Camomile and Marjoram.
23. The vertues of Corne Rose or Passee-flours Anemone.
24. The properties medicinable of Filipendula.
25. The vertues of Heliochrysum.
26. The medicines of Crowtoes.
27. The vertues of the Pycwinckle, Butchers broome, of Sampier, and wild Bassill.
28. The medicinable vertues of Colocasia, or the Egyptian Beane.
29. The properties of Anthalium.
30. The vertues of Fewerfue.
31. The vertues of Night-shade or Petie Morrell, and Alkakengi.
32. Of Corchorus, i. Chickweed, and of Cnicus, i. Carthamus or bastard Saffron.
33. Of the herbe Perfoluta.
34. Of the weights and measures vsed in old time.

In summe, there be in this booke to be found medicines, stories, and worthy obseruations, seuen hundred and thirtie.

Latine Authours alledged.

Cato Censorius, M. Varro, Massurius, Antias, C. Helius, Vestimus, Vibius, Ruffinus, Hyginus, Pomponius Mela, Pompeius Lenax, Cornelius Celsus, Calphurnius Bassus, P. Largius, Elicinius Macer, Sextius, and *Iulius Bassus*, who both wrote in Greeke, and *Antonius Casar*.

Forreine Writers.

Theophrastus, Democritus, Orpheus, Pythagoras, Mago, Menander who wrote the Treatise *Biochresta*, *Nicander, Homer, Hesiodus, Musaeus, Sophocles*, and *Anaxilax*.

Physicians.

Mnestheus and *Callimachus*, who wrote both of Guirlands made of floures, *Phanias* the naturall Philosopher or Physician, *Simus, Timaristius, Hippocrates, Chrysippus, Diocles, Ophion, Heraclides, Hicestus, Dionysius, Apollodorus* of Citia, *Apollodorus* of Tarentum, *Praxagoras, Plistonius* the Physician, *Diensch, Cleophrantus, Philistio, Asclepiades, Crateuas, Petronius, Diodorus, Iolla, Erasistratus, Diagoras, Andreas, Mnesicles, Epicharmus, Damion, Dalion, Sosimenes, Theopolemus, Metrodorus, Solon, Lycus, Olympias* the midwife of Thebes, *Phyllinus, Petreius, Mithon, Glaucia*, and *Xenocrates*.

A

IN

The first Booke of

IN THE XXII. BOOKE ARE CONTAINED discourses as touching the estima- tion of Herbes.

Chap.

1. Of certaine nations that vse herbes to beautifie their bodies.
2. Of clothes died with the juice of herbes.
3. Of the Chaplet made of the common meadow grasse.
4. How rare these Guirlands of grasse were.
5. Which were the only men that had the honour to be crowned with the said Chaplets.
6. The onely Centurion allowed to weare the said Guirlands.
7. Medicinable vertues obserued in the rest of herbes and floures that serue for Guirlands, and first of Eringe or sea Holly.
8. Of the Thistle or hearbe which they call Centum-capita.
9. Of Acanus and Liquerice.
10. Of Brambles or Thyfles called Tribuli, their kinds and vertues.
11. The vertues and properties of the hearbe Stoebe.
12. Of Hippophyes, and of Hippope, i. the Tazill, and their properties.
13. Of the Nettle and the medicinable vertues of it.
14. Of the white dead Nettle or Archangell Lamium, and the vertues of it.
15. Of the hearbe Scorpius or Caterpillers, the kinds and vertues thereof.
16. Of Leucacantha or our ladies Thistle, and the vertues of it.
17. Of Parietarie of the wall called Helxine or Perdicum, of Feuerfew or Motherwort, Par-

Chap.

- thenium, of Sideritis, i. wall Sauge or stone Sauge, and the vertues thereof good for Physicke.
18. Of Chamæleon, the sundry sorts and properties that it hath.
19. Of Coronopus, i. Crow-foot Plantaine or Buckhorn Plantain, and the vertues therof.
20. Of Orchanet, as well the right as the bastard, and the vertues of them both.
21. Another kind of Orchanet called Onoche-
lis, of Camomile, of the hearbe Lotus or
common Melilot, of Lotometra, which is a
kind of garden Lotus or fallade Clauer, of
Heliotropia, i. Turnfoll or Solcium, and
Tricocum, a kind thereof, of Maiden haire
called Adiantum and Callitricum.
22. Of bitter Lettuce or wild Cichorie, of
Thesium, of Daffodill, of Halimus, of Bran-
kurfine, of Buprestis, of Elaphoboscum or
Gratia Dei, of Scandix, i. wild Chervill or
shepheards needle, of the wild wort Iassone,
of bastard Persly, Caucalis, of Lauer, or Sil-
lybum, of Scolimus, i. the Artichoke or Li-
monia, of Sowthistle, of Chondrilla, and of
Mushromes.
23. Of Toad stools, of Silphium, & of Laserjuice
24. The nature of Hony, of Mead or Hydro-
mel: how it commeth that the fashions are
changed in certaine kinds of meat, of hony-
ed wine, of wax. A discourse against the
composition of many simples.
25. The medicinable vertues of corne.

In summe, here you shall find of medicines, stories, and obseruations, 906, gathered out of

The same Authours which were named in this booke before, and besides out of *Chrysfermus*,
Erastophenes, and *Alcaus*.

IN THE XXIII. BOOKE IS CONTAINED a Treatise of Hort-yard trees.

Chap.

1. The medicinable qualities of grapes fresh
and new gathered, of Vine cuttings and of
grape kernils, of the grape Theriace, or
Treacle Grape, of dried Grapes or Rai-
sins, of Aistaphus, of Strausacre, cal-

Chap.

- led also Pituitaria, of the wild Vine, of
the white Vine which is called Bryonie,
of the blacke Vine, of new wines, of di-
uerse and sundry sorts of wines, and also of
vinegre.

2. Of

Plinies Naturall Historie:

Chap.

2. Of the medicinable vertues of vinegre Sqi-
liticke, of Oxymell or honied vinegre, of
cuit, of the dregs or lees of wine, vinegre,
and cuit.
3. The vertue of Oliues, of the leaues of the O-
liue, of the floure and ashes of the Oliue, of
the white and blacke fruit of the Oliue: also
of the dregs or grounds of oile.
4. Medicinable properties obserued in the
leaues of the wild Oliue, of the oile made of
the wild vine floures, of the oile Cicinum,
the oiles of Almonds, Baies, and Myrtles,
the oile of Chamamyrsine or grand Myrtle,
also of Cypresse, of Cytrons, & walnuts, &c.
5. The Ægyptian Palmetree that beareth Ben,

Chap.

- also of the Date tree called Elate, and the
vertues of them.
6. The medicinable vertues of sundry plants,
namely, in their floure, leafe, fruit, boughs,
barke, wood, juice, root, and ashes.
7. Of pearces, and the obseruations to them be-
longing, of Figges both wild and sauage:
of Erineum, and other sorts of plants, with
their vertues.
8. Of Pine-nuts, and Almonds, of the Filbard
and Walnut, of Fiftickes and Chestnuts,
of Charobs, Corneiles, Strawberrie trees,
and Baies.

*K. Inba, Andreas, * Salpe, Pelops, Apelles of Thafos, Thrasillus, and Nicander.*

* A Woman.

¶ THE XXXIII. BOOKE DECLARETH the natures of Mettals.

Chap.

1. In what estimation were the mines of gold at the first in the old world: the beginning of gold rings: the proportion of gold that our ancestors had in their treasure: the degree of knights or gentlemen at Rome: the priuiledge to weare gold rings, and who only might so do.
2. The courts and chambers of judges or justices at Rome: how often the gentlemen of Rome and men of armes changed their title: the presents giuen to valiant souldiours for their braue seruice in the wars: the first crowns of gold that were seene.
3. The ancient vse of gold besides, both in men & women: of the golden coine: when copper and brasse money was first stamped: when gold and siluer was put into coine: before money was coined, how they vsed brasse

Chap.

- for exchange in old time. At the first taxation and leuie made of Tribute, what was thought to be the greatest wealth; and at what rate were the best men seised. How often and at what time gold grew into credit and estimation.
4. The mines of gold, and how naturally it is found: when the statue or image of gold was first seene: medicinable vertues in gold.
5. Of Borras, and six properties of Borras in matters of Physicke: the wonderfull nature that it hath to foder all mettals, and giue them their perfection.
6. Of Siluer, Quick-siluer, Antimonic, or Alabaster: the drosse or refuse of siluer: also the scum or some of siluer called Litharge.
7. Of Vermilion: in what account it was in old time among the Romanes: the inuention thereof.

The first Booke of

- Chap.*
thereof: of Cinnabaris or Sangdragon vsed in painting and Physick: diuers sorts of vermillion, and how painters vse it.
8. Of Quicksilver artificiall: the maner of gilding silver: of touchstones: diuers experiments to trie silver: the sundry kinds thereof.
9. Of mirrors or looking-glasse: of the silver in Egypt.
10. Of the excessive wealth of some men: in money: who were reputed for the richest men: when it was that at Rome they began to make largesse and scatter money abroad

- Chap.*
to the commons.
11. Of the superfluitie of coine, and the frugalitie of others as touching silver plate, beds and tables of silver: when began first the making of excessive great and massie platters and chargers of silver.
12. Of silver statues: the grauing and chasing in silver, & other workmanship in that metall.
13. Of Sil, of Azur, of superfine Azur named Nestorianum: also of the Azur called Cœlum: that euery yere these kinds be not sold at one price.

This booke hath in it of medicines, stories, and obseruations, 1215.

Latine Authors alledged.

L. Piso, Antias, Verrinus, M. Varro, Cor. Nepos, Messula, Rufus, Marfus the Poet, Buthus, Iulius Bassus, and Sextius Niger, (who wrote both of Physicke in Greeke) and *Fabius Vellatius*.

Forreine Writers.

Democritus, Metrodorus Scepius, Menachmus, Xenocrates, and Antigonus, who wrote all three of the feat and skill of grauing, chasing and embossing in metall: *Heliodorus*, who wrote a booke of the rich ornaments and oblations of the Athenians: *Pasteles*, who wrote of wonderfull pieces of worke: *Nymphodoros, Timæus* who wrote of Alchymie or minerall Physicke: *Iolla, Apollodoros, Andreas, Heraclides, Diagoras, Botryerisus, Archimedes, Dionysius, Aristogenes, Democritus, Mnesicles, Attalus* the Physician, *Xenocrates* the sonne of *Zeno*, and *Theomnestus*.

¶ THE XXXIIII. BOOKE TREATETH of other Mettals.

- Chap.*
1. Mines of Brasse, Copper, Iron, Lead, & Tin.
2. Sundry kinds of Brasse, namely Corinthian, Deliacke, and Ægineticke.
3. Of goodly candlesticks, & other ornaments of temples.
4. The first images made at Rome: the originall of statues: the honour done to men by statues: sundry sorts and diuers forms of them.
5. Of statues pourtraied in long Robes; and of many others who first erected images vpon columnes and pillars at Rome: when they were allowed first at the cities charges: also what maner of statues the first wer at Rome.
6. Of statues without gowne or cassocke, and some other: the first statue pourtraied on horsebacke at Rome: when the time was that all Images as well in publike places as priuat houses were abolished at Rome and put downe: what women at Rome were allowed to haue their statues; and which were the first erected in publike place by forreine nations.

- Chap.*
7. The famous workemen in making & casting Images: the excessive price of Images: of the most famous and notable colosses or gyant-like images in the citie of Rome.
8. Three hundred sixtie and six peeces of work wrought in brasse by most curious and excellent artificers.
9. What difference there is in Brasse: the diuers mixtures with other mettals: how to keepe brasse.
10. Of Brasse ore called Cadmia, and for what it is good in Physicke.
11. The refuse or scum of Brasse, Verdegri: the skales of brasse and copper, Steele, copper rust, or Spanish greene: of the collyrie ore eye-salue called Hieracium.
12. Of a kinde of Verdegri named Scolecia: of Chalcitis, i. red Vitrioll, Myfy, Sory, and Coppore or Vitrioll, i. blacke Nil.
13. Of the soile of Brasse named white Nil or Tutia: of Spodium, Antispodium, of Diphryges, and the Trient of Seruilius.

14. Of

Plinies Naturall History.

- Chap.*
14. Of Iron and mines of Iron: the difference also of Iron.
15. Of the temperature of Iron: the medicinal vertues of Iron, and the rust of Brasse and Iron: the skales of Iron, and the liquid plaister named of the Greekes Hygemplastrum.

- Chap.*
16. The mines of Lead: of white and blacke Lead.
17. Of Tin, Of Argentine Tin, and some other minerals.
18. Medicines made of Lead & refuse of Lead, of Lead ore, of Ceruse or Spanish white, of Sandaricha of red Orpiment.

In summe, here are contained natable matters, stories, and obseruations, 815.

Latine Authours cited.

L. Piso, Antias, Verrinus, M. Varro, Messala, Rufus, Marfus the Poet, Buthus, Iulius Bassus, and Sextius Niger, who wrote both in Greeke of Physicke, and *Fabius Vellatius*.

Forreine Writers.

Democritus, Metrodorus Scepius, Menachmus, Xenocrates, Antigonus, and Duris, (who all foure wrote of grauing, chasing, and embossing mettals, a worke entituled *Toreutice*;) *Heliodorus*, who described the ornaments and oblations hanged vp in Athens: *Nymphodoros, Andreas, Heraclides, Diagoras, Botryerisus, Iolla, Apollodoros, Archimedes, Dionysius, Aristogenes, Diomedes, Mnesicles, Xenocrates* the sonne of *Zeno*, and *Theomnestus*.

¶ IN THE XXXV. BOOKE IS SHEWED IN what account Painting was in old time.

- Chap.*
1. The honour and regard of Pictures in times past.
2. In what price Images were of old.
3. When Images were first erected and set vp in publicke place, as also in priuat houses, with their scutcheons and armes: the beginning of pictures: the first draught of Pictures in one simple colour: the first Painters, and how ancient they were in Italic.
4. Of Roman Painters: the first time that Painting and Pictures grew into credit: who they were that drew their victories in colors vpon tables, and set them forth to be seen: and when forreine Pictures began to be of some good reckoning at Rome.
5. The art and cunning of drawing pictures: the colours that painters vse.
6. Of colours naturall and artificiall.
7. What colour will not abide to be laid wet: what colours they painted withall in old time: at what time first the combats of sword-fencers at vtterance, were set forth in painted tables to be seene.
8. How ancient the art of Painting is, when it began: a catalogue of the excellent workemen in that kind, and how their workmanship was prized and esteemed.
9. The first that contended & strone who could

- Chap.*
paint best: also who first vsed the pencill.
10. Of Pictures so liuely drawne that birds were deceived therewith: what is the hardest point in Painting.
11. The way to still birds that they sing and chatter nor: who was the first that deuised to enamell, or to set colours with fire, and with the pencill painted arched roufs and vaults; and among, the wonderful prizes that Pictures were set at in old time.
12. The first inuentors of potterie: of Images made of clay and cast in moulds: also of vessels made of earth, and their price.
13. Sundry sorts of earth for potters: of the dust or sand of Puteoli: of other kindes of earth which turne to be hard stone.
14. Of walls made by casting in moulds: also of bricke walls, and the manner of making them.
15. Of Brimstone & Alum, their diuers kinds and vse in Physicke.
16. Of sundry sorts of earth, & namely Samia, Eretria, Chia, Selenusia, Pingitis and Ampelitis, and the vse they haue in Physicke.
17. Sundry sorts of chalker for fullers to scoure clothes, to wit, Cimolia, Sarda, Vmblica, of a kind of earth called Saxum, as also that giueth a silver color & is called Argentaria.

18. Who

The first Booke of

Chap.

18. Who were they that enriched their slaues after they were enfranchised, and who they were of slaues came vp and grew to great wealth and power.

Chap.

19. Of the earth that comes out of the Island Galeta: of the earth Clupea: also, of that which commeth from the Balear Islands, and the Isle Ebufa.

In sum, the medicins, histories, and obseruations in this booke, amount to 956.

Latine Authors alledged.

Messala the Oratour, *Messala* the Elder, *Fenestella*, *Atticus*, *Verrinus*, *M. Varro*, *Cor. Nepos*, *Decimus Eculco*, *Mutianus*, *Melissus*, *Vitruvius*, *Cassius Senerus*, *Longulanus*, *Fabius Vastalis*, who also wrote of Painting.

Forreine Writers.

Pasiteles, *Apelles*, *Melanthius*, *Aclepiodorus*, *Euphranor*, *Parafius*, *Heliodorus*, who wrote of the Pictures and other ornaments set vp at Athens, *Metrodorus* (who likewise wrote of Architecture, to wit, Masonrie and Carpentrie:) *Democritus*, *Theophrastus*, *Apion* the Grammarian who also made a booke of Minerall or Chymicke Physicke, *Nymphodorus*, *Andreas*, *Heracides*, *Iolla*, *Apolodorus*, *Diagoras Botryensis*, *Archidemus*, *Dionysius*, *Aristogenes*, *Demanus*, *Menesicles*, *Xenocratos*, the scholler of *Zeno*, and *Theomnestus*.

¶ THE XXXVI. BOOKE TREATETH of Stones.

Chap.

1. The nature and propertie of stones: the superfluitie and expence about buildings, of marble.
2. Who first shewed at Rome columnes of marble in publike place.
3. The first that brought columns of marble to Rome out of forreine countries.
4. The first workemen that were commended for cutting in marble, and at what time that inuention began.
5. Excellent peeces of worke in marble to the number of 126. The cunning and curious workmen themselves: of the white marble of the Island Paros. The stately and admirable sepulchre Mausoleum.
6. When they began at Rome to build with marble: who was the first that ouercast the outside of walls with marble: at what times this or that kind of marble was taken vp in building at Rome: who cut marble first and brought it into leaues or thin plates by cutting: the manner thereof: also of sand.
7. Of the hard stone of Naxos, and Armenia: sundry kinds of marble.
8. Of the Alabastrer marble of Lygdinum and Alabandicum.
9. Of the great obeliske at Thebes in Ægipt, and at Alexandria: of that also which is in the great cirque or shew-place at Rome,

Chap.

10. Of that obeliske which standeth in Mars field at Rome, and serueth for a Gnomon or Stile in a quadrant or dyall.
11. Of a third obeliske at Rome in the Vatican.
12. Of the Pyramides in Ægipt, and a monstrous Sphynx of a wonderfull height.
13. Of the Mazes or Labyrinths in Ægipt, the Isle Lemnos, and in Italie.
14. Of hanging gardens made vpon terraces: of a great towne where all the houses were built vpon vaults and arches, seeming to hang in the aire: also of the temple of *Diana* in Ephefus.
15. Of the stately temple of Cyzicum: of a certaine rocke of stone called Fugitiue: of an Echo that rendreth the voice seven fold: of an house built without naile or pin: of the sumptuous and wonderfull buildings at Rome.
16. Sundry kinds of the Loadstone: the medicinal vertues and properties thereof.
17. Of certain stones which soone eat & consume dead bodies that be laid therein: of others againe that preferue them long: of the stone *Asius*, and the vertues of it.
18. Of Iuorie digged out of the earth: of stones conuerted into bones: of stones that represent palms imprinted in them, and of other kinds.

19. Of

Plinies Naturall Historie:

Chap.

19. Of Curalius, or a kind of Marquesite called Pyrites, and the vertues thereof: of the stone Ostracites, and Amiantus & the properties of it: of the stone Melitites, and the power thereof: of the Geat and his medicinal properties: of Sponge stones: of the stone Phrygius and his nature.
20. Of the Bloud-stone, and fure sorts of it, and of Schistus.
21. Foure kinds of the Ægle stone, of the stone within the bellie of them called Callimus: of the stones Samius and Arabus: also of Pumish stones.
22. Of stones meet for to make Apothecaries mortars, of soft stones, of the stone Specularis, & of Flints, of the shining stone Phenigites, of whetstones, and other stones meet for building: of stones that will resist the fire and abide all weather and tempest.

Chap.

23. Of Cesterns, of Limestone, sundry sorts of sand, the tempering of sand and lime for mortars: the ill building of some walls: of parget and roughcast: also columnes and buttresses in building.
24. The medicinal vertues of Quickelime, of Maltha, and Plaster.
25. Of paucements: when they were first vsed at Rome: of terraces and pauced floores lying open to the aire aboue: of certaine paucements called Græcanica: and when arched and embowed worke first began.
26. The first inuention of glasse: the manner of making it of a kind of glasse called Obsidianum: sundry sorts of glasse in great variety.
27. Wonderfull operations of fire: the vertues thereof medicinal, and the prodigious significations and prefaces by fire.

In summe, here you may find medicines, stories, and obseruations, in all 523.

Latine Authors.

M. Varro, *Calpus*, *Galba*, *C. Iulius*, *Mutianus*, *Cor. Nepos*, *L. Piso*, *Tubero*, *Seneca*, *Fabius Vastalis*, *Annianus*, *Facialis*, *Fabius*, *Cato Censorius*, and *Vitruvius*.

Forreine Writers.

Theophrastus, *Praxitiles*, *K. Tabn*, *Niceander*, *Sotacus*, *Sudines*, *Alexander*, *Polyhistor*, *Apion*, *Plistonius*, *Durus*, *Herodotus*, *Euemernus*, *Aristagoras*, *Dionysius*, *Artemidorus*, *Butoridas*, *Antisthenes*, *Democritus*, *Demoteles*, and *Lyceus*.

¶ IN THE XXXVII. BOOKE IS DECLARED the originall of pretious stones.

Chap.

1. The pretious stone of *Polycrates* the tyrant, also of *K. Pyrrhus*: who were the best lapidaries, & could cut excellently wel in stone: the first man that at Rome ware a pretious stone vpon his finger.
2. The rich stones that were shewed in the triumph of *Pompey* the Great: the nature and vertues of the Crystall stone: the costly vessels made thereof, and the superfluous expence that way: when the vessels of Cassiodore called Myrrhina, were first inuented: the wastfull expence in them: the nature and properties of them: what lies the Greekes haue told as touching Amber.
3. The true original and beginning of Amber: the medicinal vertues thereof: the sundry kinds, and the excessive cost that folke were at to get them: of Lincurium and the pre-

Chap.

- erties of it.
4. Of Diamonds, and their kinds: their vertues: also of Pearls.
5. Of the Hemerauld and diuers sorts of it: of other Greene pretious stones cleare and transparent.
6. Of the true Opall stones, their diuers kinds; and which be counterfeit: the meanes how to try them: also of diuers other rich stones.
7. Of Rubies and carbuncles: which be counterfeit: the waies to proue whether they be good or no. Also of other ardent stones like fire.
8. Of the Topaze, and all the kinds: of the Turquois: of other Greene stones that bee not cleare through.
9. Sundry sorts of the Iasper stone.
10. Of certaine pretious stones set downe in order.

The first Booke of

Chap.

order according to the Alphabet.
11. Of some pretious stones which take their denomination of the parts of mans bodie: also from other liuing creatures, & of those which haue the names from other things.

Chap.

12. Of other new stones growing naturally: of counterfeit and artificiall stones: of their sundry formes and fashions.
13. The manner and way how to proue fine stones from other.

In summe, here are to be read of notable matters, worthy histories, and speciall obseruations, to the number of 1300, gathered out of

Latine Authours.

M. Varro, the Records of Romane triumphs, *Mecenas*, *Iacchus*, and *Cornelius Bocchus*.

Forreine Writers.

K. Iuba, *Xenocrates* the disciple of *Zeno*, *Sudines*, *Aeschylus*, *Philoxenus*, *Euripides*, *Nicander*, *Satyrus*, *Theophrastus*, *Chares*, *Philomenes*, *Democrates*, *Xenotimus*, *Metrodorus*, *Sotacus*, *Pytheas*, *Timaeus* the Sicilian, *Niceas*, *Theocrestus*, *Asaruba*, *M. nasea*, *Theomenes*, *Cresias*, *Mithridates*, *Sophocles*, *K. Arche-laus*, *Callistratus*, *Democritus*, *Ismenias*, *Olympicus*, *Alexander Polyhistor*, *Apion*, *Horus*, *Zoroastres*, and *Zactalas*.

THE SECOND BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS
SECVNDVS.

CHAP. I.

¶ Whether the World be finite, and but one.

C H E World, and this, which by another name men haue thought good to call heauen (vnder the pourprife and bending cope whereof, all things are emmanteled and couered) beleue we ought in all reason to be a God, eternally vnmeasurable, without beginning, and likewise endlesse. What is without the compasse hereof, neither is it fit for men to search, nor within mans wit to reach and conceiue. Sacred it is, euermlasting, infinit, all in all, or rather it selfe all and absolute: finite and limited, yet seeming infinite: in all motions orderly and certaine: howbeit in shew and iudgement of man, vncertaine: comprehending and containing all whatsoeuer, both without and within: Natures worke, and yet very Nature it selfe, producing all things. Great folly it is then, and meete madnesse, that **D** some haue deuised and thought in their minde to measure it, yea, and durst in writing set down the dimensions thereof: that others againe, by occasion hereupon taken or giuen, haue deliuered and taught, That worlds there were innumerable: as if we were to beleue so many natures as there were Heauens: or if all were reduced to one, yet there should be so many Sunnes and Moones neuerthelesse, with the rest also of those vnmeasurable and innumerable starres in that one: as though in this pluralitie of worlds we should not alwaies meet with the same question still at euery turne of our cogitation, for want of the vtmost and some end to rest vpon: or if this infinitenesse could possibly be assigned to Nature, the worke-mistresse and mother of all; the same might not be vnderstood more easily in that one Heauen which wee see; so great a worke especially and frame as it is. Now surely a fantasticall folly it is of all other follies, to go **E** forth of it, and so to keepe a seeking without, as if all things within were well and clearly knowne already: as who would say, a man could take the measure iust of any third thing, who knoweth not his owne: or the minde of man see those things, which the very World it selfe may not receiue.

CHAP. II.

¶ Of the forme and figure of the World.

F H A T the forme of heauen is round, in fashion of an absolute and perfect globe, the name thereof principally, and the consent of all men agreeing to call it in Latine *Orbis*, (i. a roundle; as also many naturall reasons, do evidently shew: to wit, not onely for that such a figure euery way falleth and bendeth vpon it selfe, is able to beare and vphold it selfe, includeth and compriseth it selfe, hauing need thereto of no ioints, as finding in any part thereof no end nor beginning: or because this forme agreeth best to that motion, whereby euery and anon it must turne about:

B

(as

Plinies Naturall Historie.

(as hereafter it shall appeare) but also because the eyesight doth approue the same: in that look which way soeuer you will thereupon, it seemeth to bend downward, round, and euen on all sides, shewing a iust Hemisphere, a thing not incident possibly to any other figure.

CHAP. III.

¶ Of the motion of Heauen.

That the world thus framed, in a continuall and vncessant circuit, with vspeakable swiftnesse turneth round about in the space of foure and twenty houres, the rising and setting ordinarily of the Sunne hath left cleare and doubtlesse. Now, whether it be led about, and neuer resteth in that reuolution, cannot be heard with our eares, I cannot so easily resolue and pronounce: no more I assure you, than I may auouch the ringing of the starres that are driuen about therewith, and toll with all their owne spheres: or determine, that as the Heauen moueth, it doth represent indeed a pleasant and incredible sweet harmonie both day and night: although to vs within, it seemeth to passe in silence. That there be imprinted therein the pourtraits of liuing creatures, and of all things besides without number, as also that the body thereof is not all ouer smooth and slicke (as we see in birds eggs) which excellent Authors haue termed *Tenerum* is shewed by good arguments: for that by the fall of naturall seeds from thence of all things, and those for the most part blended and mixed one with another, there are ingendred in the world, and the sea especially, an infinite number of strange and monstrous shapes. Ouer and besides, our eyesight testifieth the same; whiles in one place there appeareth the resemblance of a waine or chariot, in another of a beare, the figure of a bull in this part, of a letter in that, and principally the middle circle ouer our head, more white than the rest, toward the North pole.

CHAP. IIII.

¶ Why the World or Heauen is called *Mundus*.

Verily for mine owne part, moued I am and ruled by the generall consent of all nations. For, the World, which the Greekes by the name of ornament, called *Mundus*. And without all question, Heauen we haue named *Caelum*, as it were Engrauen and garnished, according as *M. Varro* interpreteth it. And hereto maketh much the orderly ranke of things therein, and namely the circle called *Signifer*, or the Zodiacke set forth and diuided by the formes of twelue liuing creatures therein portraied: together with the manner of the Sunnes race throughout them, keeping euer the same course still, for so many ages past.

CHAP. V.

¶ Of the foure Elements.

Neither see any doubt made as touching the Elements, That they be foure in number. The highest, Fire: from whence are those bright eyes of so many shining starres. The next, Spirit which the Greekes and our country men by one name called Aire: Vital this element is, and as it giueth life to all things, so it soone passeth through all, and is intermeddled in the whole: by the power wherof, the earth hangeth poised and ballanced iust in the midst, together with the fourth element of the Waters. Thus by a mutuall entertainment one of another, diuers natures are linked and knit together: so as the light elements are kept in & restrained by certain weights of the heauier, that they flie not out: and contrariwise the massier be held vp, that they fall not downe, by means of the lighter, which couer to be aloft. So, through an equall endeuor to the contray, each of them hold their owne bound as it were by the restlesse circuit of the very world: which, by reason that it maketh euen more upon it selfe, the earth falleth to be lowest, and the middle of the whole: and the same hanging steadily by the poles of the heauen, peiseth thofe

Plinies Naturall History.

A those elements by which it hangeth in a counterballance. Thus it alone resteth vnmoouable; whiles the whole frame of the world turneth about it: and as it is knit and vnited by all, so all rest and beare vpon the same.

CHAP. VI.

¶ Of the seuen Planets.

Betweene the earth and heauen there hang in the same spirit or element of aire about named, seuen stars, seuered one from another, and distant afunder certaine spaces, which of their variable motion wee call wandering planets, whereas indeed none stray and wander lesse than they. In the midst of them the Sun taketh his course, as being the greatest and most puissant of all the rest: the very ruler, not of times and seasons onely, and of the earth, but also of the starres and heauen it selfe. Beleue we ought, this Sun to be the very life, and (to speake more plainly) the soule of the whole world, yea, and the principall gouernance of nature: and no lesse than a God or diuine power, considering his workes and operations. He it is that giueth light to all things, and riddeth them from darknesse: he hideth the other starres, and sheweth them againe: he ordereth the seasons in their alternatiue course: he tempereth the yeare, arising euer fresh and new againe, for the benefit and good of the world. The lowering dimnesse of the skie he dispatcheth, yea, and cleareth the darke mists and clowdinesse of mans minde: to other stars likewise he lendeth out his owne light. Most excellent, right singular he is, as seeing all, & hearing all. For this, I see, is the opinion of *Homer* (the prince of learning) as touching him alone.

CHAP. VII.

¶ Of God.

I Suppose therefore that to seeke after any shape of God, and to assigne a forme and image to him, bewraith mans weakenesse. For God, whosoever hee be [if haply there be any other, but the very world] and in what part soeuer resiant, all sense he is, all sight, all hearing: he is all life, all soule, all of himselfe. And verily to beleuee that there be gods innumerable, and those according to mens virtues and vices, to wit, Chastitie, Concord, Vnderstanding, Hope, Honour, Clemencie, Faith; or (as *Democritus* was of opinion) that there are two gods onely, and no more; namely, Punishment, and Benefit: These conceits, I say, make mens idlenesse and negligencie the greater. But all commeth of this, That fraile and crasse mortall men, remembering wel their owne infirmities, haue digested these things apart, to the end that each one might from thence chuse to worship and honour that whereof he stood in need most. And hereupon it is, that in sundry nations we finde the same gods named diuersly, according to mens deuotion: and in one region ye shall haue innumerable gods. The infernall powers beneath likewise, yea, and many plagues haue been raunged by themselves, and reckoned for gods in their kinde, whilest with trembling feare wee desire that they were pacified. Which superstition hath caused a chappell to be dedicated to the Feuer, in the mount Palatium, euen by publike order from the State. Likewise an altar to *Orbona*, neere the temple of *Lares*: because another erected to *Bad Fortune* in *Esquiliaz*. And thereby we may conceiue that there are a greater number of gods in heauen aboue, than of men vpon earth: since that euery one of their owne accord make so many gods as they list, fitting themselves with *Iuno*es and *Genij* for their patrons. Now certain Nations there be that account beasts, yea, and some filthie things for gods; yea and many other matters more shamefull to be spoken: swearing by stinking meats, by garlick, and such like. But surely, to beleuee that gods haue contracted mariage, and that in so long continuance of time no children should be borne between them: also that some are aged, and euer hoarie and gray: others againe young and alwaies children: that they be blacke of colour and complexion, winged, lame, hatched of eggs, liuing and dying each other day, are meere fooleries, little better than childish toies. But it passeth and exceedeth all shamelesse impudencie, to imagine adulteries amongst them: erstfoones also chiding, scolding, harred, and malice: and more than that, how there be gods, patrons of theft and wickednesse. Whereas in very deed, a god vn-

to a man is he, that helpeth a man: and this is the true and direct path-way to everlasting glory. In this way went the noble Romans in old time: and in this tract at this day goeth, with heavenly pace, *Vespasian Augustus*, both he and his children: *Vespasian*, I say, the most mightie ruler of the whole world: whiles he relieueth the afflicted State of the Romane Empire and Common-weale. And this is the most ancient manner of requitall to such benefactors, That they should be canonized gods. And hereof came the names as well of all other gods, as of the stars and planets (which I haue mentioned before) in recognisance of mens good deserts. As for *Iupiter* verily and *Mercurie*, and other princes raunged among the gods, who doubteth that they were called otherwise among themselves? and who confesseth not how these be celestiall denominations, to expresse and interpret their nature.

Now, That the soueraigne power and deity, whatsoeuer it is, should haue regard of mankind is a toy and vanity worthy to be laughed at. For can we chuse but beleuee, can we make any doubt, but needs that Diuinity and Godhead must be polluted with so base & manifold a ministry? And hardly in manner may it be iudged, whether of the twain be better and more expedient for mankind to beleuee, that the gods haue regard of vs, or to be persuaded that they haue none at all: considering, That some men haue no respect and reuerence at all of the gods, others againe so much, as it is a very shame to see their superstition. Addicted these are and devoted to serue them by forein magicke ceremonies: they weare their gods vpon their fingers in rings, yea, they worship and adore monsters: they condemne and forbid some meats, yet they deuise others for them. Impose they do vpon them hard and vengible charges to execute, not suffering them to rest and sleep in quiet. They chuse neither mariages nor children, ne yet any one thing els, but by the approbation & allowance of sacred rites and mysteries. Contrariwise, others there are so godlesse, that in the very capitoll they vse deceit, and forswear themselves euen by *Iupiter*, for all that he is ready to shoot his thunderbolts: and as some speed wel enough with their wicked deeds and irreligion; so others againe feele the smart and are punished by the faines whom they adore, and the holy ceremonies which they obserue.

Howbeit, betwene both these opinions, men haue found out to themselves a middle God-head and diuine power, to the end that we should giue still a more vncertaine coniecture as touching God indeed. For throughout the whole world, in euery place, at all times, and in all mens mouths, Fortune alone is sought vnto and called vpon: she only is named and in request; shee alone is blamed, accused, and endited. None but shee is thought vpon; shee only is praised, shee only is reprobued and rebuked; yea, and worshipped is shee with railing and reprochfull tearms: and namely when shee is taken to be wauering & mutable: and of the most sort supposed also blind, rousing at random, vnconstant, vncertaine, variable, and fauoring the vnworthy: whatsoeuer is laid forth, spent, and lost, whatsoeuer is receiued, woon and gotten: all that comes in, all that goes out is imputed to Fortune: and in all mens reckonings and accounts shee makes vp the booke, and sets all freight. So abiect we are, so seruile also and enthralled to Lots, that euen the very chance of Lots is taken for a god, than which nothing maketh vs more doubtfull and ignorant of God.

Now there are another sort, that reiect Fortune & Chance both, and wil not abide them, but attribute the euents and issues of things, to their owne feuerall stars, and go by the fatall horoscope or ascendent of their natiuitie: affirming that the same shall euer befall, which once hath bin set downe and decreed by God: so as he for euer after may sit still and rest himselfe. And this opinion beginneth now to settle and take deep root, inso much as both the learned, and also the rude and ignorant multitude, run that way on end. From hence (behold) proceed the warnings & admonitions of lightnings, the fore-knowledge by Oracles, the predictions of Sooth-sayers, yea, and other contemptible things not worthy to be once spoken of; as freeing, and stumbling with the foot, are counted matters of presage. *Augustus Caesar* of famous memorie hath made report and left in writing, that his left foot shooe was vntowardly put on before the right, on that very day, when he had like to haue miscarried in a mutiny among his souldiers.

Thus these things euery one doe enwrap and entangle silly mortall men, void of all forecast and true vnderstanding: so as this only point among the rest remains sure and certain, namely, That nothing is certaine: neither is there ought more wretched and more proud withall; than man. For all liuely creatures else take care onely for their food, wherein Natures goodnes and bountie of it selfe is sufficient: which one point verily is to be preferred before all good things

*Here let
Christians take

vnto them out
of the holy
scriptures;

A things whatsoeuer, for that they neuer thinke of glory, of riches, of seeking for dignities and promotions, nor ouer and aboue, of death. Howbeit, the beleefe that in these matters the gods haue care of mens estate, is good, expedient, and profitable in the course of this life: as also that the vengeance and punishment of malefactors may well come late (whiles God is busily occupied otherwise in so huge a frame of the world) but neuer misseeth in the end: and that man was not made next in degree vnto God, for this, That he should be wel-neare as vile and base as the brut beasts. Moreouer, the chiefe comfort that man hath, for his imperfections in Nature, is this, That euen God himselfe is not omnipotent, and cannot do all things: for neither he is able to worke his owne death, would he neuer so faine, as man can do when he is wearie of his life; the best gift which he hath bestowed vpon him, amid so great miseries of his life (nor indowd B mortall men with everlasting life: ne yet recall, raise, and reuiue those that once are departed and dead) nor bring to passe, that one who liued, did not liue, or he that bare honorable offices, was not in place of rule and dignity. Nay, he hath no power ouer things done and past, saue onely obliuion: no more than he is able to effect (to come with pleasant reasons and arguments to proue our fellowship therin with God) that twise ten should not make twenty: and many such things of like sort. Whereby (no doubt) is evidently proued, the power of Nature, and how it is she, and nothing els, which we call God. I thought it not impertinent thus to diuert and digresse to these points, so commonly divulged, by reason of the vsuall and ordinarie questions as touching the Essence of God. *Every thing is possible to God, but what is and is not possible*
Contradiction - 1.2. *And not Contradictions - therefore both possible & probable*

CHAP. VIII.

Of the Nature of Planets, and their circuit.

Et vs returne now to the rest of Natures workes. The stars which we said were fixed in heauen, are not (as the common sort thinketh) assigned to euery one of vs, and appointed to men respectiue, namely, the bright & faire for the rich; the lesse for the poore: the dim for the weak, the aged and feeble: neither shine they out more or lesse according to the lot and fortune of euery one, nor arise die likewise with the same: ne yet as they set and fall, do they signifie that any bodie is dead. D There is not, ywis, so great societie betwene heauen and vs, as that together with the fatall necessitie of our death, the shining light of the starres should in token of sorrow go out and become mortall. As for them, the truth is this; when they are thought to fall, they doe but shooe from them a deale of fire, euen of that abundance and ouermuch nutriment which they haue gotten by the attraction of humiditie and moisture vnto them, like as we also obserue daily in the wikes and matches of lampes or candles burning, with the liquour of oile. Moreouer, the celestiall bodies, which make and frame the world, and in that frame are compact and knit together, haue an immortall nature: and their power and influence extendeth much to the earth; which by their effects and operations, by their light and greatnesse might be knowne, notwithstanding they are so high and subtrill withall, as we shal in due place make demonstration. E manner likewise of the heavenly Circles and Zones shall be shewed more fitly in our Geographicall treatise of the earth, forasmuch as the consideration thereof appertaineth wholly thereunto: onely we will not put off, but presently declare the deuifers of the Zodiacke, wherein the signes are.

The obliquitie and crookednesse thereof, *Anaximander* the Milesian is reported to haue obserued first, and thereby opened the gate and passage to Astronomie, and the knowledge of all things: and this happened in the 58 Olympias. Afterwards *Clostratus* marked the signes therein, and namely those first of *Aries* and *Sagittarius*. As for the sphere it selfe, *Atlas* deuised long before. Now for this time we will leaue the very bodie of the starry heauen, and treat of all the rest betwene it and the earth.

F Certaine it is, that the Planet which they call *Saturne*, is the highest; and therefore seemeth least: so that he keepeth his course, and performeth his revolution in the greatest circle of all: and in thirtie yeares space at the soonest, returneth againe to the point of his first place. Moreouer, that the moouing of all the Planets, and withall of Sun and Moone, go a contrarie course vnto the starrie heauen, namely, to the left hand (i. Eastward:) whereas the said heauen alwaies

hasteneth to the right [i. Westward.] And albeit in that continuall turning with exceeding celerity, those planets be lifted vp aloft, and carried by it forcible into the West, and there set: yet by a contrarie motion of their owne, they passe euery one through their feuerall waies Eastward, and all for this, that the aire rolling euer one way, and to the same part, by the continuall turning of the heauen, should not stand still, grow dull, & as it were congealed, whiles the globe thereof reflecteth idle, but dissolue and cleaue, parted thus, & diuided, by the reuerberation of the contrarie beams, and violent crosse influence of the said planets. Now, the Planet *Saturne* is of a cold and frozen nature, but the circle of *Iupiter* is much lower than it, and therefore his reuolution is performed with a more speedy motion, namely, in twelue yerres. The third of *Mars*, which some call the Sphere of *Hercules*, is fry and ardent, by reason of the Suns vicinity, and wel-neere in two yerres runneth his race. And hereupon it is, that by the exceeding heate of *Mars*, and the vehement cold of *Saturne*, *Iupiter*, who is placed betwixt, is well tempered of them both, and so becommeth good and comfortable. Next to them is the race of the Sun, consistyng verily of 360 parts [or degrees:] but to the end that the obseruation of the shadowes which he casteth, may returne againe iust to the former marks, fise daies be added to euery yeare, with the fourth part of a day ouer and aboue. Whereupon euery fift yeere leapeeth, and one odde day is set to the rest: to the end that the reckoning of the times and seasons might agree vnto the course of the Sun. Beneath the Sun a goodly faire star there is, called *Venus*, which goeth her compasse, wandering this way and that, by turnes: and by the very names that it hath, testifieth her emulation of Sun and Moone. For all the while that she preuenteth the morning, and riseth Orientall before, she taketh the name of *Lucifer* (or Day-star) as a second Sun hastning the day. Contrariwise, when she shineth from the West Occidentall, drawing out the day light at length, and supplying the place of the Moone, she is named *Vesper*. This nature of hers, *Pythagoras* of Samos first found out, about the 42 olympias, which fel out to be the 142 yeere after the foundation of Rome. Now this planet in greatnesse goeth beyond all the other fise: and so cleare and shining withall, that the beames of this one star cast shadowes vpon the earth. And hereupon commeth so great diuersitie and ambiguitie of the names thereof: whiles some haue called it *Iuno*, other *Isis*, and other some the Mother of the gods. By the naturall efficacie of this star, all things are engendred on earth: for whether she rise East or West, she sprinckleth all the earth with dew of generation, and not onely filleth the same with seed, causing it to conceiue, but stirreth vp also the nature of all liuing creatures to engender. This planet goeth through the circle of the Zodiacke in 348 daies, departing from the Sun neuer aboue 46 degrees, as *Timaeus* was of opinion. Next vnto it, but nothing of that bignesse and powerful efficacie, is the star *Mercurie*, of some cleped *Apollo*: in an inferiour circle he goeth, after the like manner, a swifter course by nine daies: shining sometimes before the Sun rising, otherwhiles after his setting, neuer farther distant from him than 23 degrees, as both the same *Timaeus* and *Sofigenes* doe shew. And therefore these two planets haue a peculiar consideration from others, and not common with the rest aboue named. For those are seene from the Sun a fourth, yea, and third part of the heauen: oftentimes also in opposition full against the Sun. And all of them haue other greater circuits of full reuolution, which are to be spoken of in the discourse of the great yeare.

How much was this great emulation?

CHAP. IX.

¶ Of the Moones nature.

The Moone.

Vt the Planet of the Moone, being the last of all, most familiar with the earth, and deuised by Nature for the remedie of darknesse, out-goeth the admiration of all the rest. She with her winding and turning in many and sundry shapes, hath troubled much the wits of the beholders, fretting and fuming, that of this staire, being the neereft of all, they should be most ignorant, growing as it doth, or else waiting euermore. One while bended pointwise into tips of hornes: anotherwhiles diuided iust in the halfe, and anon againe in compasse round: spotted sometime and darke, and soone after on a sudden exceeding bright: one while big and full, and another while all at once nothing to bee seene. Sometime shining all night long, and otherwhiles late it is ere she riseth: shee also helpeth the Sunnes light some part of the day: eclipsed, and yet in that eclipse to be seene. The same at the moneths end lieth hidden, at what time (it is supposed) shee labour-

reth

- A reth and trauellet not. At one time yee shall see her below, and anon aloft: and that not after one manner, but one while reaching vp close to the highest heauen, and another while ready to touch the mountains: sometimes mounted on high into the North, and sometime cast down below into the South. Which feuerall constitutions and motions in her, the first man that obserued, was *Endymeeon*: and thereupon the voice went, That he was enamoured vpon the Moone. Certes, thankfull we are not, as we ought to be, vnto those who by their trauell and careful endeavour haue giuen vs light in this light. But delighted rather we are wonderously (such is the pestilent wit and wicked disposition of man) to record in Chronicles, bloudshed and murders: that lewd acts and mischieuous deeds should be knowne of them, who otherwise are ignorant of the world it selfe. Well, to proceed, the Moone being next to the Centre, and therefore of least compasse, performs the same course and circuit in feuen and twentie daies, and one third part of a day, which *Saturne* the highest planet runnes (as we said before) in thirty yerres. After this, making stay in coniunction with the Sun two daies, forth she goes, and by the thirtieth day at the most, returneth to the same point and ministry againe: the mistresse, if I may so say, and the teacher of all things Astronomicall, that may be known in heauen. Now by her meanes we taught that the yeere ought to be diuided into twelue moneths: for as much as, the Moone meeteth or ouertaketh the Sun so many times before he returneth to the same point where he began his course. Likewise that shee loseth her light (as the rest of the planets) by the brightness of the Sun, when she approacheth neere. For borrowing wholly of him her light, shee doth shine: much like to that which we see glittering and flying too and fro in the reflection and reuerberation of the Sun-beames from the water. And hereupon it is, that she, by her more mild and vnperfect power dissolueth, yea and increaseth, so great moisture as the doth, which the sun beames may consume. Hence it comes also, that her light is not euen and equall in sight, because then only when she is opposite vnto the Sunne, she appeareth full: but all other daies she sheweth no more to vs here on earth, than she conceiueh light of the Sunne. In time verily of coniunction or change, she is not seene at all: for that whiles she is turned away, all the draught of light, she casteth thither backe againe, from whence she receiued it. Now that these planets are fed doubtles with earthly moisture, it is euident by the Moone: which so long as she appeareth by the halfe in sight, neuer sheweth any spots, because as yet shee hath not her full power of light sufficient, to draw humour vnto her. For these spots be nothing else but the dregs of the earth, caught vp with other moisture among the vapors.

CHAP. X.

¶ Of the Sunne and Moones eclipse: and of the Night.

- MOREouer, the eclipse of the Moone and Sunne (a thing throughout the vniuersall contemplation of Nature most marvellous, and like a strange and prodigious wonder) doth shew the bignesse and shadow of these two planets. For euident it is, that the Sunne is hidden by the coming betweene of the Moone: and the Moone againe by the opposition of the Earth: also that the one doth quit the other, in that the Moone by her interposition bereaueth the Earth of the Sunnes raies, and the earth againe doth the semblable by the Moone. Neither is the Night any thing else but the shade of the Earth. Now the figure of this shadow resembleth a pyramis, pointed forward, or a top turned vp side downe: namely, when as it falleth vpon it with the sharpe end thereof, nor goeth beyond the heights of the Moone: for that no other starre is in that manner darkened: and such a figure as it, alwaies endeth point-wise. And verily, that shadowes grow to nothing in great space of distance, appeareth by the exceeding high flight of some fowles. So as the confines of these shadowes, is the vtmost bound of the aire, and the beginning of the fire. Aboue the Moone all is pure and light some continually. And we in the night doe see the starres, as candles or any other lights from out of darknesse. For these causes also the Moone in the night season is eclipsed onely.
- F But the reason why the Sun and Moone, are not both in the eclipse at set times and monethly, is the winding obliquitie of the Zodiacke, and the wandering turnings of the Moone one while fare South, and another while as much North (as hath been said:) and for that these planets do not alwaies in their motion meet iust in the points of the eclipticke line, to wit, in the head or taile of the Dragon.

CHAP. XI.

¶ Of the magnitude of Starres.

THe reason of this listeth vp mens mindes into heaven: and as if they beheld and looked downe from thence, discover vnto them the magnitude of the three greatest parts of the whole world. For the Sunnes light could not wholly be taken away from the earth, by the Moone comming betweene, in case the earth were bigger than the Moone. But the huge greatnesse of the Sunne is more certainly knowne, both by the shadow of the Earth, and the bodie of the Moone: so as it is needlesse to search and inquire into the largenesse thereof, either by prooffe of eie-sight, or by coniecture of the minde. How vnmeasurable it is, appeareth evidently by this, That trees which are planted in limits from East to West, casteth shadowes equall in proportion; albeit they be neuer so many miles assunder in length: as if the Sunne were in the middest of them all. This appeareth also about the time of the equinoctiall in all regions meridionall, when the Sunne shineth directly plumb over mens heads, and casteth no shadow. In like manner, the shadowes of them that dwell Northerly vnder the Solstitiall circle in Summer, falling all at noone tide, Northward, but at Sunne-rising, Westward, doing the same demonstration. Which possibly could not be, vnlesse the Sunne were far greater than the earth. Moreouer, in that, when he rises, he surpasses in breadth the hill Ida, compassing the same at large both on the right hand and the left, and namely, being so farre distant as he is. The eclipse of the Moone doth shew also the bignesse of the Sunne, by an infallible demonstration; like as himselfe eclipsed, declareth the littleness of the earth. For whereas there be of shadowes three formes and figures: and euident it is, that if the darke materiall body which casteth a shadow, be equall in bignesse to the light, then the shadow is fashioned like a colume or pillar, and hath no point at the end: if it be greater, it yeeldeth a shadow like a top directly standing vpon the point, so as the nether part thereof is narrowest, and then the shadow likewise is of infinite length: but if the said body be lesse than the light, then is represented a pyramidall figure like an hey-cocke, falling out sharpe pointed in the top; which manner of shadow appeareth in the Moones eclipse: it is plaine, manifest, and without all doubt, that the Sunne is much bigger than the earth. The same verily is seen by the secret and couert proofes of Nature it selfe. For why in dividing the times of the yeere, departeth the Sunne from vs in the winter? marry, euene because by meanes of the nights length and coolenesse, he would refresh the earth, which otherwise no doubt he should haue burnt vp: for, it notwithstanding, he burneth it in some measure, so excessiue is the greatnesse thereof.

CHAP. XII.

¶ The inuentions of man as touching the obseruation of the heauens.

THe reason verily of both eclipses, the first Romane that published abroad and divulged, was *Sulpitius Gallus*, who afterward was Consul, together with *M. Marcellus*: but at that time being a Colonell, the day before that King *Perseus* was vanquished by *Paulus*. he was brought forth by the Generall into open audience before the whole host, to fore-tell the eclipse which should happen the next morning: whereby he deliuered the armie from all penfuenesse and feare, which might haue troubled them in the time of battell, and within a while after he compiled also a booke thereof. But among the Greeks, *Thales Meseius* was the first that found it out, who in the eight and fortieth Olympias, and the fourth yeere thereof, did prognosticate and foreshew the Sunnes eclipse that happened in the reigne of *Halyattes*, and in the 170. yeere after the foundation of the citie of Rome. After them, *Hipparchus* compiled his Ephemerides, containing the course and aspects of both these planets, for six hundred yeeres ensuing: comprehending withall the moneths according to the calculation & reckonings of sundry nations, the daies, the houres, the scituation of places, the aspects, and latitudes of diuers townes and countries: as the world will beare him witnesse: and that no lesse assuredly, than if he had been priuie to Natures counsels. Great persons and excellent these were doubtlesse, who about the reach of all capacitie of mortall men, found out the reason of the course of so mighty starres and diuine powers: and whereas the sillie minde of men

WAS

A was before set and to seeke, fearing in these eclipses of the starres, some great wrong and violence, or death of the planets, secured them in that behalfe: in which dreadfull feare stood *Strechorus* and *Pindarus* the Poets (notwithstanding their lofty stile,) and namely at the eclipse of the Sun, as may appeare by their poems. As for the Moone, mortall men imagine, that by magicke, forceries, and charmes, she is enchanted, and therefore helpe her in such a case when she is eclipsed by dissonant ringing of basons. In this fearefull fit also of an eclipse, *Nicias* the Generall of the Athenians, as a man ignorant of the course thereof, feared to set saile with his fleet out of the haven, and so greatly endangered and distressed the state of his countrey. Faire chieue yee then for your excellent wit, O noble Spirits, interpreters of the heauens, capable of Natures works, and the deuisers of that reason whereby ye haue surmounted both God and man. For who is he, that seeing these things, and the painfull ordinarie trauels, since that this terme is now taken vp, of the stars, would not beare with his owne infirmitie, and excuse this necessitie of being born to die? Now for this present I will briefly and summarily touch those principall points which are confessed and agreed vpon as touching the said eclipses, hauing lightly rendred a reason thereof in most needfull places: for neither such prouing and arguing of these matters belongs properly to our purposed worke; neither is it lesse wonder to be able to yeeld the reason and causes of all things, than to be resolute and constant in some.

CHAP. XIII.

¶ Of Eclipses.

Certaine it is, that all Eclipses in 222 moneths haue their reuolutions, and return to their former points: as also that the Sun's eclipse neuer happeneth but vpon the change of the Moone, namely either in the last of the old, or first of the new, which they call conjunction: and that the Moone is neuer eclipsed but in the full, and alwaies somewhat preuent the former Eclipse. Moreouer, that euery yeare both planets are eclipsed at certaine daies and houres vnder the earth. Neither be these eclipses in all places seene when they are about the earth, by reason sometimes of cloudy weather, but most often, for that the globe of the earth hindereth the sight of the bending conuexitie of the heauen. Within these two hundred yeeres was it found out by the witty calculation of *Hipparchus*, that the Moone sometimes was eclipsed twice in five moneths space, and the Sun likewise in seven: also that the Sun and Moone twice in thirty daies were darkned about the earth: howbeit seene this was not equally in all quarters, but of diuers men in diuers places: and that which maketh me to maruell most of all in this wonder, is this, that when agreed it is by all, that the Moone light is dimmed by the shadow of the earth, one while this eclipse hapneth in the West, and another while in the East: as also by what reason it hapned, that seeing after the Sunne is vp, that shadow which dusketh the light of the Moone must needs be vnder the earth; it fell out once, that the Moone was eclipsed in the West, and both planets to be seene about the ground in our horizon: for that in twelue daies both these lights were missing, and neither Sun nor Moon were seene, it hapned in our time, when both the *Vespasians* (Emperors) were Consuls, the father the third time, and the son the second.

CHAP. XIV.

¶ Of the Moones motion.

Clearer it is, that the Moone alwaies in her encreasing hath the tips of her hornes turned from the Sun toward the East: but in the waine contrariwise Westward. Also that she shines the first day of her apparition, 3 parts, and the foure and twentieth part of an houre, and foriseth in proportion the second day forward, vnto the full: and likewise decreaseth in the same manner to the change. But alwaies she is hidden in the change within fourteen degrees of the Sunne. By which argument we collect, that the magnitude of the other Planets is greater than that of the Moone, for so much as they appeare otherwhiles when they be but seven degrees off. But the cause why they shew lesse, is their altitude: like as also the fixed starres, which by reason of the brightnesse of the Sunne are not seene in the day time; whereas indeed they shine as clearely by day as by night. And that is manifestly proued by some

some eclipses of the Sun, and exceeding deepe pits, for so they are to be seene by day light.

CHAP. XV.

¶ General rules touching the motions and lights of other Planets.

THose three which we say are about the Sun be hidden when they goe their course together with him. They arise in the morning, and be called Orientall Matutine, and neuer depart farther than eleuen degrees. But afterwards meeting with his raies and beames, they are couered, and in their triple aspect retrograde, they make their morning station a hundred and twenty degrees off, which are called the first; and anon in a contrarie aspect or opposition, 180 degrees off, they arise in the euening, and are Occidentall Vespertine. In like sort approaching from another side within an hundred and twenty degrees, they make their euening stations, which also they call the second, vntill he ouertake them within twelue degrees, and so hide them, and these are called the euening settings. As for *Mars*, as he is neerer vnto the Sun, so feelerh he the Sun beames by a quadrant aspect, to wit ninetic degrees, whereupon that motion tooke the name, called the first and second Nonagenarie from both risings. The same planet keepeth his stationarie residence six moneths in the signes: whereas otherwise of his owne nature but two moneths. But the other planets in both stations or houses continue not all out foure moneths apiece. Now the other two inferiour planets vnder the Sun go downe and are hidden after the same manner in the euening Coniunction, and in as many degrees they make their morning rising: and from the farthest bounds of their distance they follow the Sun, and after they haue once ouertaken him, they set againe in the morning, and so outgo him. And anon keeping the same distance, in the euening they arise againe vnto the same limits which we named before, from whence they are retrograde, and return to the Sun, and by the euening setting they be hidden. As for *Venus*, she likewise maketh two stations, according to the two manners of her apparance, morning and euening, when she is in farthest bounds and vtmost points of her Epicycle. But *Mercurie* keepeth his stations so small a while that they cannot be obserued. This is the manner and order as well of the lights and appearances of the planets, as of their occultations, and keeping close intricate in their morion, and enfolded within many strange wonders. For change they do their magnitudes and colours; sometime they approach into the North, the same againe go backe toward the South, yea, and all on a sudden they appeare one while neerer to the earth, and another while to the heauen: wherein if we shall deliuer many points otherwise than former Writers, yet confesse we do, that for these matters we are beholden vnto them, who first made demonstration of seeking out the wayes thereto: howbeit let no man dispaire, but that hee may profit and goe forward alwaies in further knowledge from age to age. For, these strange motions fall out vpon many causes. The first is, by reason of those eccentrique circles or Epicycles in the stars, which the Greekes call *Abfides*; for needs we must vse in this treatise the Greeke termes. Now euery one of the planets haue particular Auges or circles aforesaid by themselves, and these different from those of the starry heauen: for that the earth from those two points which they call Poles, is the very centre of the heauen, as also of the Zodiacke, scituate ouerthwart betweene them. All which things are certainly knowne to be so by the compasse, that neuer can lie. And therefore for euery centre there arise their owne *Abfides*, whereupon it is, that they haue diuers circuits, and different motions, because necessarie it is, that the inward and inferiour *Abfides* should be shorter.

CHAP. XVI.

¶ Why the same Planets seeme sometime higher, and some lower.

The highest *Abfides* therefore from the centre of the earth are of *Saturne*, in the signe Scorpio: of *Iupiter*, in Virgo: of *Mars*, in Leo: of the Sun, in Gemini: of *Venus* in Sagittarius: of *Mercury* in Capricorne: and namely in the middle or fifteenth degree of the said signes: and contrariwise the said planets in the same degrees of the opposite signes are lowest, and to the centre of the earth neereft. So it cometh to passe, that they seeme to moue more slowly when they goe their highest circuit: not for that

At that naturall motions doe either hasten or slacke, which be certaine and seuerall to euery one: out because the lines which are drawne from the top of the *Abfides*, must needs grow narrow and neere together about the centre, as the spokes in cart wheelles: and the same motion by reason of the neerenesse of the centre, seemeth in one place greater, in another lesse. The other cause of their subtilities is, for that in other signes they haue the *Abfides* eleuated highest from the centre of their own eccentrique circles. Thus *Saturne* is in the height of his Auge in the 20. degree of Libra, *Iupiter* in the 15. of Cancer, *Mars* in the 28. of Capricorne, the Sunne in the 29. of Aries, *Venus* in the 16. of Pisces, *Mercurie* in the 15. of Virgo, and the Moone in the 4. of Taurus. The third reason of their altitude or eleuation, is not taken from their Auges or circles eccentric, but vnderstood by the measure and conuexitie of heauen, for that these planets seeme to the eie as they rise and fall, to mount vp or settle downward through the aire. Hereunto is knit and vnited another cause also, to wit, the Zodiaks obliquitie, & latitude of the planets, in regard of the eclipticke: For through it the starres which we called wandering, do moue and take their course. Neither is there any place inhabited vpon earth, but that which lieth vnder it. For at the circle of the Zodiacke, 2. degrees: which is supposed to be the very efficient cause, that certaine liuing creatures are ingendred and bred euen in the desert and vnhabitable parts of the world. The Moone likewise rangeth throughout all the bredth of it, but neuer goeth out of it. Next after these, the starre of *Mercurie* hath the largest scope in the Zodiacke, but yet so, as of 12. degrees (for that is the bredth thereof) he wandreth out 8. and those none equally, but two in the midst, foure aboue, and two beneath. Then the Sunne in the midst, goeth alwaies betwene the two extremities of the Zodiacke: but in his declining course from South and North, he seemeth to wind bias after the manner of Dragons or Serpents, vnequally. *Mars* in his latitude reacheth the eclipticke line foure halfe degrees, *Iupiter* two degrees and a halfe, *Saturne* no more but two, like as the Sunne. Thus you see the manner of the latitudes, as they descend Southward, or ascend Northward. And vpon this is the reason grounded also of the 3. opinion of them, who imagine that the planets do arise and mount from the earth vpward into heauen. For very many haue thought, although vntuly, that they climbe in this manner. But to the end that they may be reproofed and confuted, we must lay open an infinite and incomprehensible subtiltie, & that which containeth all those causes & reasons aboue said. First therefore this is a reed on and resolved, that these stars or planets in their euening setting, are neereft to the earth, both in regard of latitude, & also of altitude: and then they be called Occidentall Vespertine, when the Sun toward the euening couereth them with his raies: also, when they be farthest from the earth, as well in latitude as eleuation, they be Orientall Matutine, & arise or appeare in the morning before the Sun is vp: as also that then they are Stationaries in their houses, which be in the middle points of the latitudes which they call eclipticks. Likewise, confessed it is, that so long as the planets are neer to the earth, their motion seemeth to encrease & be quicke: but as they depart on high, to decrease and be slow. And this reason is approued & confirmed principally by the eleuations and depressions of the Moone. As doubtles it is also, and held for an infallible rule, that euery planet being Orientall Matutine, riseth euery day higher than other. The superior three about the Sun diminish euen from their first stations vnto the second. Which being so, it will plainly appeare, that euery planet Orientall Matutine, rising before the Sun, begins to mount the latitude Septentrional, & decline from the Ecliptick Northward: in such sort, that from the time they begin to dismarch, their motion increases by little and little more spaciouly. But in the first Stations, they are at the highest altitude & ascent: for then and not before, the numbers begin to be withdrawne, & the planets to go backward, and be retrograde. Whereof a particular reason by it selfe may be giuen, in this manner: The Planets being smitten in that part wherof we spake, they are both inhibited by the triangular beames or Trine aspect of the sun, to hold on a straight and direct course in the longitude of heauen, and so be retrograde: and so are raised vp aloft by the fire power of the said sun. This cannot presently at the first be vnderstood by our eiesight: whereupon they are supposed to stand, and hereof their Stations took the name. Then proceedeth forward the violence of the Sun beames or aspect, and the vapour thereof by repercussion, forceth them to be euidently retrograde, and go backward. And much more is this perceiued in their euen rising, when they be Orientall Vespertine, when the Sun is wholly against them, and when they be driuen to the very top of their *Abfides*, and so not seene

at all, because they are at the highest, and goe their least motion, which is so much the lesse, when as it hapneth in the highest signes of their Auges or *Abides*. From the euen arising after the Sunne setting, they descend toward the latitude meridian all, for now the motion lesse diminisheth, but yet encreaseth not before the second stations: for that they are forced to descend, by reason of the Sun beames comming from the other side of their Epicycle: and the same force beareth them downward againe to the earth, which by the former triangular aspect raised them aloft towards heauen. So much skilleth it whether the said beames came from beneath or aboue. The same happeneth much more in the euen setting, when they be hidden with the raies of the Sun. This is the reason of the superiour planets aboue the Sunne: but the Theoricque is more difficult of the rest, and hath by no man before vs been deliuered.

CHAP. XVII.

¶ Generall rules as touching the Planets.

First and formost therefore let vs set downe the cause why *Venus* starre neuer departeth from the Sunne more than 46. degrees, and *Mercurie* not aboue 23. and (being as they are diuers Planets) why oftentimes they retyre backe vnto the Sunne within that compasse. For to be resolu'd in this point, note we must, that both of them haue their *Abides* turned opposite to the rest, as being seated vnder the Sun: and so much of their circles is vnderneath, as the forenamed were aboue: and therefore farther off they cannot be, because the curuature and roundle of their *Abides* in that place hath no greater longitude. Therefore both edges of their *Abides*, by a like proportion keepe an indifferent meane, & their course is limited: but the short spaces of the longitudes, they recomperce againe with the wandering of their latitudes. But what is the reason that they reach not alwaies to 46. degrees, and to 23. yes ywis do they: but this the Canonick Astronomers haue missed of in their Aphorismes. For it is apparent, that their *Abides* also or Auges do moue, because they neuer ouerpasse the Sunne. And therefore when their edges from either side are perceived to fall vpon the very point, then the planets also are supposed to reach vnto their longest distances: but when their edges or the points of their Epicycles be short so many degrees, the starres themselves are thought to returne more speedily in their retrogradation, than in their direct course forward, albeit the vtmost extremitie which they both haue, is euer the same. And from hence is the reason vnderstood of the contrary motions of these two planets. For the superiour planets moue most swiftly in the euen setting, but these most slowly. They, I say, be farthest from the earth, when they moue slowest; and these when they goe swiftest: for as in the former the neerenesse of the centre hasteneth them; so in these, the extremitie of the circle: they, from their mornerising begin to slack their celeritie; but these, to encrease it: they returne back from their morning Station to their euening mansion; but *Venus* contrariwise is retrograde from the Station Vespertine, to the Matutine. Howbeit, she from the morne rising beginneth to climbe the latitude Septentrionall: but to follow the altitude and the Sunne, from the morning station, as being most swift, and at the highest, in the morne setting. Moreouer, shee beginneth to digresse in latitude, and to diminish her motion from the morne rising; but, to be retrograde, and withall to digresse in altitude, from the euening station. Again, the planet *Mercury*, being Oriental Matutin, begins both waies to climb, that is, to mount higher day by day; but to digresse in latitude, being Oriental Vespertine: and when the Sunne hath overtaken him within the distance of fiftene degrees, he stands still for foure daies vnmoueable. Within a while he descendeth from his altitude dayly, and goeth backe retrograde from the euen setting, namely, when the Sunne hideth him with his raies, to the Moone rising, when hee appeareth before the Sunne is vp. This starre onely, and the Moone, descend in as many daies as they ascend. But *Venus* ascendeth vp to her station in fiftene daies and the vantage. Again, *Saturne* and *Jupiter* are twice as long descending, and *Mars* foure times. See how great variety is in their nature, but the reason thereof is euident. For they which go against the vapour and heate of the Sunne do also hardly descend. Many secrets more of Nature, and lawes whereunto she is obedient, might be shewed about these things. As for example: The planet of *Mars*, whose course of all others can be least obserued, neuer maketh station but in quadrate aspect: as for *Jupiter*, in triangle aspect: and very feldome seuered from the Sunne 60. degrees, which number maketh fix angled formes of the heauen,

A heauen, that is to say, is the iust sixth part of the heauen: neither doth *Jupiter* shew his rising in the same signe this yeare, as in the former, saue onely in two signes, *Cancer* and *Leo*. The planet *Mercurie* feldome hath his euen rising in *Pisces*, but very often in *Virgo*, and the morne rising in *Libra*. In like manner, the morne rising in *Aquarius*, but very feldome in *Leo*. Neither becommeth he retrograde in *Taurus* and *Gemini*: and in *Cancer*, not vnder the 25 degree. As for the Moone, she entrench not twice in coniunction with the Sun in any other signe but in *Gemini*; and sometime hath no coniunction at all, and that only in *Sagittarius*. As for the last and first of the Moone, to be seene in one and the selfe same day or night, hapneth in no other signe but *Aries*, and few men haue had the gift to see it: and hereupon came *Lincolne* to be so famous for his eye sight. Also the planets *Saturne* and *Mars* are hidden with the Sun beames, and appeare not in the heauen at the most 170 daies: *Jupiter* 36, or at least ten daies wanting, *Venus* 69, or when least 52. *Mercury* 31, or at least 17.

CHAP. XVIII.

¶ What is the cause that the Planets alter their colour.

The reason of the Planets altitudes is it that tempereth their colours, according as they be neerer or farther off from the earth. For they take the likenesse of the aire, into the coasts whereof they enter in their ascent: and the circle or circumference of another Planets motion coloureth them as they passe either way, ascending or descending. The colder setteth a pale colour, the hotter a red, and the windie a searefull and rough hue. Onely the points and coniunctions of the *Abides*, and the vtmost circumferences shew a darke blacke. Each planet hath a seuerall colour: *Saturne* is white, *Jupiter* cleare and bright, *Mars* fierie and red, *Venus* Orientall (or *Lucifer*) faire, Occidentall (or *Vesper*) shining, *Mercury* sparkeling his raies; the Moone pleasant, the Sunne when he riseth burning, afterwards glittering with his beames. Vpon these causes the sight is intangled, and discouereth euen those stars also which are contained and fixed in the sky, more or lesse. For one while a number of them appeare thicke about the halfe Moone, when in a cleare and calme night she gently beautifieth them. Another while they are seene but here and there, insomuch as we may wonder that they are fled vpon the full Moone, which hideth them: or when the beams either of the Sun or other aboue said haue dazzled our sight. Yea, the very Moone her selfe hath a feeling doubtlesse of the Sun beames, as they come vpon her: for those raies that come sidelong, according to the conuexitie of the heauen, giue but a darke and dim light to the Moone, in comparison of them that fall directly with straight angles. And therefore in the quadrangle aspect of the Sun she appeareth diuided in halfe: in the triangle she is well neere inuironed, but her circle is half empty and void, howbeit in the opposition she seemeth full: and againe, as she is in the waine she representeth the same formes, decreasing by quarters as she increased, with like aspects as the other three planets aboue the Sun.

CHAP. XIX.

¶ The reason of the Suns motion, and the vnequalitie of daies.

As for the Sun himselfe, a man may obserue foure differences in his course, twice in the yeare making the night equall with the day, to wit, in the Spring and Autumne, for then he falleth iust vpon the centre of the earth, namely in the eighth degree of *Aries* and *Libra*. Twice likewise exchanging the compasse of his race; to lengthen the day from the *Bruna* or mid-winter, in the eighth degree of *Capricorne*: and againe to lengthen the night from the Sommer Sunsted, being in as many degrees of *Cancer*. The cause of vnequall daies is the obliquitie of the Zodiack: whereas the one halfe iust of the world, to wit, fix signes of the Zodiack, is at all times aboue and vnder the earth. But those signes which mount vpright in their rising, hold light a longer tract, and make the daies longer: whereas they which arise crooked and gobyas passe away in shorter and swifter time.

CHAP. XX.

¶ Why lightnings are attributed to *Iupiter*.

Most men are ignorant of that secret, which by great attendance vpon the heauens, deepe Clerkes and principall men of learning haue found out: namely, that they be the fires of the three vppermost planets, which falling to the earth carry the name of lightnings: but those especially which are seated in the midst, to wit, about *Iupiter*, haply because participating the excessiue cold and moisture from the vpper circle of *Saturne*, and the immoderate heate from *Mars* that is next vnder, by this meanes he dischargeth the superfluitie, and hereupon it is commonly said, that *Iupiter* shooteth and darteth lightnings. Therefore, as out of a burning piece of wood a cole of fire flieth forth with a cracke; euen so from a star is spit out as it were and voided forth this cœlestiall fire, carrying with it presages of future things: so as the heauen sheweth diuine operations euen in these parcels and portions which are reiected and cast away as superfluous. And this most commonly hapneth when the aire is troubled, either because the moisture that is gathered moueth and stirreth forward that abundance to fall; or else for that it is disquieted with the birth (as it were) proceeding from a great bellied starre, and therefore would be discharged of such excrements.

CHAP. XXI.

¶ The distances of the Planets.

Many haue essayed to finde out the distance and eleuation of the planets from the earth, and haue set downe in writing, that the Sun is distant from the Moon 18 degrees, euen much as the Moone from the earth. But *Pythagoras*, a man of a quicke spirit, hath collected, that there are 126000 furlongs from the earth to the Moone, and a duple distance from her to the Sun, and so from thence to the twelue signes three times so much. Of which opinion was also our countreyman *Gallus Sulpitius*.

CHAP. XXII.

¶ Of the Planets musicke and harmonie.

But *Pythagoras* otherwhiles vsing the termes of Musicke, calleth the space betweene the earth and the Moone a Tonus, saying, that from her to *Mercurie* is halfe a tone, and from him to *Venus* in manner the same space. But from her to the Sun as much and half againe: but from the Sunne to *Mars* a Tonus, that is to say, as much as from the earth to the Moone. From him to *Iupiter* halfe a Tonus: likewise from him to *Saturne* halfe a Tonus: and so from thence to the signifer Sphere or Zodiacke, so much and halfe againe. Thus are composed seuen tunes, which harmonie they call Diapason, that is to say, the Generalitie, or whole state of consent and concord, which is perfect musicke. In which, *Saturne* moueth by the Dorick tune: *Mercury* by Phthongus; *Iupiter* by the Phrygian; and the rest likewise. A subtilty more pleasant yw is than needfull.

CHAP. XXIII.

¶ The Geometry or dimension of the world.

A Stadium or Furlong maketh of our paces an hundred twentie and fise, that is to say, six hundred twenty and fise foot. *Pofidonius* saith, That from the earth it is no lesse than forty stadia, to that height or altitude wherein thicke weather, windes, and clouds doe engender. Aboue which, the aire is pure, cleare, and light, without any troubled darkenesse. But from the cloudy and muddy region to the Moone is 2000000 stadia: from thence to the Sun fise thousand. By means of which middle space betweene it commeth to passe, that so exceeding great as the Sun is, he burneth not the earth. Many there be morouer, who haue taught, that the clouds are eleuated to the hight of nine hundred stadia. Vnknown these points are,

Are, and such as men cannot wind themselves out of: but as well may they now be deliuered to others, as they haue bin taught to vs in which notwithstanding, one infallible reason of a Geometrical collection which neuer lieth, cannot be reiected, if a man will searce deep into these matters. Neither need a man to seeke a iust measure hereof; for to desire that, were in manner a point of fond and foolish idlenesse, as if men had nothing else to do, but onely to make an estimate, and resolve vpon a guesse and coniecture thereof. For, whereas it is plaine and apparent by the course of the Sunne, that the circle through which he passeth, doth containe three hundred threescore, and almost six degrees: and alwaies the dimetrent line, or diameter, taketh a third part of the circumference, and little lesse than a seuenth part of a 3. it is plain, that deducting one halfe thereof (by reason that the earth seituates as a centre, commeth betweene) the first part well neere of this great circuit which he makes about the earth (so farre as our mind doth comprehend) is the very height from the earth vp to the Sunne, but the twelfth part to the Moone, because she runneth so much a shorter compasse than the Sun: whereby it appeareth, that she is in the middest betweene the earth and the Sun. A wonder it is to see how farre the presumptuous minde and heart of man will proceed, and namely being imited and drawne on by some little successe, as in the aboue named matter. The reason whereof ministrith plenteous occasion of impudencie, for they who dared once to giue a guesse at the space betweene the Sun and the earth, are so bold to do the like from thence to heauen. For presuming, that the Sunne is in the middest, they haue at their fingers ends by and by the very measure also of the whole world. For look how many seuen parts the dimetrent hath, so many 22. parts or thereabout hath the whole circle: as if they had gotten the iust and certain measure of the heauen by leuel, and the plumb or perpendicular line. The Egyptians according to the reckoning which *Petofiris* and *Necessos* haue inuented, do collect, That euery degree in the circle of the Moone, which is the least (as hath been said) of all other, containeth 33. stadia, and somewhat more: in *Saturne*, the greatest of all the rest, duple so much: and in the Sunne, which we said was the middest, the halfe of both measures. And this computation hath very great importance, for he that will reckon the distances betweene the circle of *Saturne* and the Zodiacke, by this calculation shall multiplie an infinite number of Stadia.

CHAP. XXIII. ¶ Of sudden Starres.

D There remaine yet some few points as touching the world: for in the very heauen there be Starres that suddenly arise and appeare, whereof be many kindes.

CHAP. XXV.

¶ Of Comets or blazing stars, and cœlestiall prodigies, their nature, situation, and diuers sorts.

E Hese blazing starres the Greekes call *Cometas*, our Romanes *Crinitas*: dreadfull to be seene, with bloody haire, and all ouer rough and shagged in the top like the bush of haire vpon the head. The same Greekes call those starres *Pogonias*, *Pogonias* which from the nether part haue a maine hanging downe, in fashion of a long beard. As for those named *Acrotie*, they brandish and shake like a speare or dart, signifying great swiftnesse. This was it, whereof *Tiberius Cesar* the Emperour wrote an excellent Poeme in his fift Consulship, the last that euer was seene to this day. The same, if they be shorter and sharpe pointed in the top, they vse to call *Xiphie*: and of all other palest they be, and glitter like a sword, but without any reies or beames: which another kind of them, named *Disiens* (resembling a dish or coit, whereof it beareth the name, but in colour like to amber) putteth forth here and there out of the brimmes and edges thereof. As for *Pitheus*, it is seene in forme of tunnes, enuironed within a smokie light, as if it were a concautie. *Cerattas* resembleth an horne: and such a one appeared when the whole manhood of Greece fought the battell of Salamis. *Lampadias* is like to burning torches: and *Hippus* to horse maines, most swift in motion, & turning round. There is also a white Comet with siluer haire, so bright and shining, that hardly a man can endure to looke vpon it, and in mans shape it sheweth the very image of a god. Moreouer, there be blazing starres that become all shaggie, compassed round with hairie fringe, and a kind of maine. One heretofore appearing in the forme of a main, changed

C ij

g d,

ged into a speare, namely in the 108 Olympias, and the 398 yeare from the foundation of Rome. Noted it hath bin, that the shortest time of their appearance is a seuen-night, and the longest eighty daies: some of them moue like the wandering planets; others are fixed fast, and stir not. All in maner are seen vnder the very North star called *Charlemaignes* Wain: some in no certain part thereof, but especially in that white, which hath taken the name of the * Milk circle. *Aristotle* saith that many are seene together, a thing that no man else hath found out, so far as I can learne. Mary, boisterous windes and much heate of weather are foretoked by them. There are of them scene also in Winter season, and about the Antarticke South pole; but in that place without any beames. A terrible one likewise was scene of the people in Ethiopia and Egypt, which the King who reigned in that age named Typhon. It resembled fire, and was pleited and twisted in manner of a wreath, grim and hideous to be looked on, and no more truly to be counted a star than some knot of fire. Sometimes it falleth out, that the planets and other stars are bespred all ouer with haire: but a Comet lightly is neuer seen in the west part of the heauen.

A fearefull star for the most part this Comet is, and not easily expiated; as it appeared by the late ciuill troubles when *Octavianus* was Consul: as also a second time, by the intestine war of *Pompey* and *Cesar*. And in our dayes about the time that *Claudius Cesar* was poysoned, and left the Empire to *Domitius Nero*, in the time of whose reigne and gouernment there was another in manner continually seen, and euer terrible. Men hold opinion, that it is materiall for preface to obserue into what quarters it shooteth, or what stars power and influence it receiuet: also what similitudes it resembleth, and in what parts it shineth out and first ariseth. For if it be like vnto flutes or hautboies it portendeth somewhat to Musicians: if it appeare in the priuy parts of any signe, then let ruffians, whore-masters, and such filthy persons take heed. It is respectiue to fine wits, and learned men, if it put forth a triangular or foure-square figure, with euen angles, to any scituations of the perpetuall fixed stars. And it is thought to preface, yea to sprinkle and put forth poison, if seen in the head of the Dragon either North or South.

In one only place of the whole world, namely in a Temple at Rome, a Comet is worshipped and adored, euen that which by *Augustus Cesar* himselfe, of happy memorie, was iudged verie lucky and happy to him; who when it began to appeare, gaue attendance in person, as ouerseer of those playes and games which he made to *Venus genetrix*, not long after the death of his father *Cesar*, in the colledge by him instituted and erected: testifying his ioy in these words, *In those very daies during the solemnities of my Plaies, there was seen a blazing star for seuen daies together, in that region of the sky which is vnder the North star Septentriones. It arose about the 11 houre of the day, bright it was and cleare, and evidently scene in all lands: by that star it was signified, as the common sort beleueed, that the soule of (Iulius) Cesar was receiued among the diuine powers of the immortal gods. In which regard, that marke or ensigne of a star was set to the head of that statue of Iulius Cesar, which soone after we dedicated in the Forum Romanum.* These words published he abroad: but in a more inward ioy, to himselfe he interpreted and conceiued thus of the thing, That this Comet was made for him, and that himselfe was in it borne. And verily, if we wil confesse a truth, a healthfull, good, and happy preface that was to the whole world. Some there be who beleuee, that these be perpetuall stars, and go their course round, but are not seen vnlesse they be left by the Sun. Others againe are of opinion, that they are ingendred casuall by some humour, and the power of fire together, and thereby do melt away and consume.

CHAP. XXVI.

¶ *Hipparchus his opinion of the Stars. Also historicall examples of Torches, Lamps, beames, Fiery Darts, opening of the Firmament, and other such impressions.*

Hipparchus the foresaid Philosopher (a man neuer sufficiently praised, as who proued the affinitie of stars with men, and none more than he; affirming also that our soules were parcell of heauen) found out and obserued another new star ingendred in his time, and by the motion thereof on what day it first shone, he grew presently into a doubt, Whether it hapned not very often that new stars should arise; and whether those starres also moued not, which we imagined to be fixed. The same man went so farre, that he attempted (a thing euen hard

A hard for God to performe, to deliuer to posteritie the iust number of starres. He brought the same stars within the compasse of rule and art, deuising certaine instruments to take their seuerall places, and set out their magnitudes: that thereby it might be easily discerned, not only whether the old died, and new were borne, but also whether they moued, and which way they tooke their course, likewise whether they increased or decreased. Thus he left the inheritance of heauen vnto all men, if haply any one could be found able to enter vpon it as lawfull heire.

There be also certaine flaming torches shining out in the sky, howbeit neuer scene but when they fall. Such a one was that which at the time that *Germ. Cesar* exhibited a shew of Sword-fencers at vtterance, ran at noontide in sight of all the people. And two sorts there be of them, namely *Lampades*, which they call plaine torches; and *Bolides*, i. Lances, such as the Mutinians saw in their calamitie when their city was sacked. Herein they differ, for that those lampes or torches make long traines, whiles the forepart only is on a light fire: but *Bolides* burnes all ouer, and draweth a longer taile. There appeare and shine out after the same manner certain beames, which the Greekes call *Docus*: like as when the Lacedemonians being vanquished at sea, lost the empire and dominion of Greece. The firmament also is scene to chinke and open, and this they name *Chasma*.

CHAP. XXVII.

¶ *Of the strange colours of the Sky.*

THere appeareth in the Sky also a resemblance of bloud, and (than which nothing is more dread and feared of men) a fiery impression, falling from out of heauen to earth; like as it hapned in the 3 yeare of the 107 Olympias, at what time King *Philip* made all Greece to shake with fire and sword. And these things verily I suppose to come at certaine times by course of nature, like as other things, and not as the most part thinke, of fundry causes, which the subtil wit and head of man is able to deuise. They haue indeed been fore-runners of exceeding great miseries; but I suppose those calamities hapned not because these impressions were, but these therefore were precatored to foretell the accidents that ensued afterward. Now for that they fall out so seldome, the reason thereof is hidden and secret, and so not knowne, as the rising of planets about said, the eclipses, and many other things.

CHAP. XXVIII. ¶ *Of the Heauen flame.*

Likewise there are seen stars together with the Sun all day long; yea, and very often about the compasse of the Sun other flames, like vnto garlands of corne eares; also circles of fundry colours, such as those were when *Augustus Cesar* in the prime of his youth entered the city of Rome after the decease of his father, to take vpon him his great name and imperial title.

CHAP. XXIX. ¶ *Of Celestiall Crownes.*

Also the same garlands appeare about the Moone and other goodly bright stars which are fixed in the firmament. Round about the Sun there was scene an arch, when *Lu. Opimius* and *Q. Fabius* were Consuls: as also a round circle, when *L. Porcius* and *M. Acilius* were Consuls.

CHAP. XXX. ¶ *Of sudden Circles.*

THere appeared a circle of red colour when *L. Iulius* and *P. Rutilius* were Consuls. Moreover, there are strange eclipses of the Sunne, continuing longer than ordinarie; as namely when *Cesar* Dictator was murdered. Moreover, in the wars of *Antony* the Sun continued almost a whole yeare of a pale wan colour.

CHAP. XXXI. ¶ *Many Suns.*

Over and besides, many Suns are scene at once, neither about nor beneath the bodie of the true Sunne indeed, but crosse-wise, and ouerthwart: neuer neere nor directly against the earth, neither in the night season, but when the Sun either riseth or setteth. Once they

they are reported to haue bene scene at noone day in Bosphorus, and continued from morne to euen. Three Suns together our Ancestors in old time haue often beheld, as namely when *Sp. Posthumus*, with *Q. Mutius*, *Q. Marius*, with *M. Porcius*, *M. Antonius*, with *P. Dolabella*, and *Mar. Lepidus*, with *L. Plancus*, were Consuls. Yea, and we in our daies haue scene the like, when *Cl. Cesar* (of famous memorie) was Consul, together with *Cornelius Orfitus* his Colleague. More than three we neuer to this day finde to haue been scene together.

CHAP. XXXII. ¶ *Many Moones.*

THree Moones also appeared at once, and namely when *Cn. Domitius* and *C. Fannius* were Consuls, which most men called Night Sunnes.

CHAP. XXXIII. ¶ *Day light in the Night.*

OVt of the Firmament by night there was seen a light, when *C. Calius* and *Cn. Papyrius* were Consuls, yea and oftentimes besides, so as the night seemed as light as the day.

CHAP. XXXIV. ¶ *Burning Shields or Targets.*

A Burning shield ran sparkling from the West to the East, at the Suns setting, when *L. Valerius* and *C. Marius* were Consuls.

CHAP. XXXV. ¶ *A strange sight in the Sky.*

BY report there was once scene, and neuer but once, when *Cn. Octavius* and *C. Scribonius* were Consuls, a sparkle to fall from a star: and as it approached the earth, it waxed greater; and after it came to the bignesse of the Moone it shined out and gaue light, as in a cloudy and darke day: then being retyred againe into the sky, it became, to mens thinking, a burning Lampe. This, *Licinius Syllanus* the Proconsull saw, together with his whole traine.

CHAP. XXXVI. ¶ *The running of Stars to and fro in the Sky.*

SEene there be also Stars to shooe hither and thither, but neuer for nought and to no purpose: for, from the same quarter where they appeare, there rise terrible windes, and after them stormes and tempests both by sea and land.

CHAP. XXXvij. ¶ *Of the Stars called Castor and Pollux.*

I Haue scene my selfe in the campe, from the soldiers sentinels in the night watch, the resemblance of lightning to sticke fast vpon the speares and pikes set before the rampier. They settle also vpon the crosse Saile yards and other parts of the ship, as men do faile in the sea, making a kinde of vocall sound, leaping to and fro, and shifting their places as birds do which fly from bough to bough. Dangerous they be and vnlucky when they come one by one without a companion; and they drowne those ships on which they light, and threaten shipwrack, yea, and they set them on fire if haply they fall vpon the bottome of the keele. But if they appeare two and two together, they bring comfort with them, and foretell a prosperous course in the voyage, as by whose comming, they say, that dreadfull, cursed, and threatening meteor called *Helena* is chased and driuen away. And hereupon it is that men assigne this mighty power to *Castor* and *Pollux*, and inuocate them at sea no lesse than gods. Mens heads also in the euen tyde are scene many times to shine round about, and to be of a light fire, which presageth some great matter. Of all these things there is no certain reason to be giuen, but secret these be, hidden with the maiestie of Nature, and reserved within her cabinet.

CHAP. XXXvij. ¶ *Of the Aire.*

IT remaineth now (thus much and thus far being spoken of the world it selfe) to wit, the starry heaven and the planets) to speake of other memorabell things obserued in the Skie. For euen that part also hath our forefathers called *Caelum*, (i. e.) the Skie, which otherwise they name *aere*: euen all that portion of the whole, which seeming like a void and empty place, yeeldeth this vitall spirit whereby all things do liue. This region is seated beneath the Moone, and farre vnder that Planet (as I obserue it is in a manner by euery man agreed vpon.) And mingling together an infinite portion of the superiour coelestiall nature or elementarie fire, with

A with an huge deale likewise of earthly vapours, it doth participate confusedly of both. From hence proceed clouds, thunders, and those terrible lightnings. From hence come haile, frosts, shoures of raine, stormes and whirlewindes: from hence arise the most calamities of mortall men, and the continuall warre that nature maketh with her owne selfe. For these grosse exhalations as they mount upward to the heauen, are beaten backe and driuen downward by the violence of the starres: and the same againe when they list, draw vp to them those matters, which of their owne accord ascend not. For thus we see, that shoures of raine do fall, foggie mists and light clouds arise, riuers are dried vp, haile stormes come downe amaine, the Sunne beames doe scorch and burne the ground, yea, and driue it euery where to the middle centre: but the same againe vnbroken, and not losing their force, rebound backe and take vp with them whatsoeuer they haue drunke vp and drawne. Vapours fall from aloft, and the same returne againe on high: winds blow forcibly, and come empty, but backe they goe with a bootie, and carry away euery thing before them. So many liuing creatures take their wind and draw breath from aboue: but the same labourer contrariwise, and the earth infuseth into the aire a spirit and breath, as if it were cleane void and empty. Thus while the Nature goes too and fro, as forced by some engin, by the swiftnesse of the heauen, the fire of discord is kindled and groweth hot. Neither may the abide by it, and stand to the fight, but being continually carried away, she rolleth vp and downe: and as about the earth shee spreadeth and pitcheth her tents, as it were, with an vnmeasurable globe of the heauen, so euery and anon of the clouds she frameth another skie. And this is that region where the winds raigne. And therefore their kingdom principally is there to be scene, where they execute their forces, and are the cause well neere of all other troubles in the aire. For thunderbolts and flashing lightnings most men attribute to their violence. Nay, more than that, therefore it is supposed that otherwhiles it raineth stones, because they were taken vp first by the winde: so as we may conclude, that they cause many like impressions in the aire. Wherefore many matters besides are to be treated of together.

CHAP. XXXIX. ¶ *Of ordinary and set seasons.*

IT is manifest, that of times and seasons, as also of other things, some causes be certaine; others, casual and by chance; or, such as yet the reason thereof is vnknowne. For who need to doubt, that Summers and Winters, and those alternatiue seasons which we obserue by yearely course, are occasioned by the motion of the Planets. As therefore the Sunnes nature is vnderstood by tempering and ordering the yeare: so the rest of the starres and planets also haue euery one their proper and peculiar power, and the same effectually to shew and performe their owne nature. Some are fruitfull to bring forth moisture, that is turned into liquid raine: others to yeeld an humour either congealed into frosts, or gathered and thickened into snow, or else frozen and hardened into haile: some afford winds: others warmth: some hot and scorching vapours: some, dewes: and others, cold. Neither yet ought these starres to be esteemed so little as they shew in sight, seeing that none of them is lesse than the Moone, as may appeare by the reason of their exceeding height. Well then, euery one in their own motion, exercise their seuerall natures: which appeareth manifestly by *Saturne* especially, who setteth open the gates for raine and shoures to passe. And not onely the seuen wandering starres be of this power, but many of them also that are fixed in the firmament; so often as they be either driuen by the excesse and approach of those planets, or pricked and prouoked by the casting and influence of their beams; like as we find it happeneth in the seuen stars called *Sucula*, which the Grecians of raine name *Hyades*, because they euery bring foule weather. Howbeit some, of their owne nature, and at certaine set times do cause raine, as the rising of the Kids. As for *Arcturus*, he neuer lightly appeareth without some tempestuous and stormie haile.

CHAP. XL. ¶ *The power of the Dog-starre.*

W H knoweth not, that when the Dogge-starre riseth, the heate of the Sunne is fierie and burning: the effects of which starre are felt exceeding much vpon the earth. The seas at his rising do rage and take on, the wines in sellars are troubled, pooles also and standing waters doe stirre and moue. A wilde beast there is in Egypt, called *Orix*, which the Egyptians say doth stand full against the Dog-starre when it riseth, looking

looking wistly vpon it, and testifieth after a sort by sneezing, a kind of worship. As for dogs, no man doubteth verily, but all the time of the canicular daies they are most ready to run mad.

CHAP. XLI.

¶ *That the stars haue their seuerall influences in sundry parts of the signes, and at diuers times.*

Some take it
for Rudo:
Wert-wort:
others for
Turn-fol, or
the Marygold.

Moreover, the parts of certaine signes haue their peculiar force, as appeareth in the Equinoctiall of Autumne, and in mid-winter, at what time we perceiue, that the Sun maketh tempests. And this is proued, not onely by raines and stormes, but by many experiments in mens bodies, and accidents to plants in the country. For some men are stricken by the Planet, and blasted: others are troubled and diseased at certaine times ordinarily, in their belly, sinewes, head, and minde. The Oliue tree, the Aspe or white Poplar, and Willowes, turne or wryth their leaues about at Mid-summer, when the Sun entreth Cancer. And contrariwise, in very Mid-winter, when he entreth Capricorne, the herbe Penyroiall flourisheth fresh, euen as it hangs within house, drie and ready to wither. At which time all parchments & such like bladders or skinned are so pent and stretched with spirit and wind, that they burst withall. A man might maruell hereat, who marketh not by daily experience, that one herbe called * *Heliotropium*, regardeth and looketh toward the Sun euer as he goeth, turning with him at all houres, notwithstanding he be shadowed vnder a cloud. Now certaine it is, that the bodies of Oysters, Muskles, Cocles, and all shell fishes, grow by the power of the Moone, and thereby againe diminish: yea, and some haue found out by diligent search into Natures secrets, that the fibres or filaments in the liuers of rats and mice, answer in number to the daies of the Moones age: also that the least creature of all others, the Pismire, feelth the power of this Planet, and alwaies in the change of the Moone ceaseth from worke. Certes, the more shame it is for man to be ignorant and vnskillfull, especially seeing that he must confesse, that some labouring beasts haue certaine diseases in their eyes, which with the Moone do grow and decay. Howbeit the excessiue greatnesse of the heauen and exceeding height thereof, diuided as it is into 72 signes, maketh for him, and serueth for his excuse: Now these signes are the resemblances of things or liuing creatures, into which the skillfull Astronomers haue with good respect digested the firmament. For example sake, in the taile of Taurus there be seuen, which they named in old time *Verigilie*, in the forehead other seuen called *Sucule*, and *Bootes*, who followeth after the wain or great Beare *Septentriones*.

CHAP. XLII.

¶ *The causes of raine, showers, winds, and cloudes.*

I Cannot denie but without these causes there arise raines and windes: for that certaine it is, how there is sent forth from the earth a mist sometimes moist, otherwhiles smokie, by reason of hot vapours and exhalations. Also that clouds are ingendered by vapours which are gone vp on high, or else of the aire gathered into a waterie liquor: that they be thicke, grosse, and of a bodily consistence, wee guesse and collect by no doubtful argument, considering that they ouer-shadow the Sun, which otherwise may be seene through the water, as they know well that diue to any depth whatsoeuer.

CHAP. XLIII.

¶ *Of Thunder and Lightning.*

Denie I would not therefore, but that the ferie impressions from stars aboue may fall vpon these clouds, such as we oftentimes see to shoot in cleare and faire weather: by the force-ble stroke whereof, good reason it is, that the aire should be mightily shaken, seeing that arrows and darts when they are discharged, sing and keepe a noise as they flie. But when they encounter a cloud, there arises a vapor with a dissonant sound (like as when a red hot yron maketh

A keth an hissing being thrust into water) & a smokie fume walmeth vp with many turnings like waues. Hereupon stormes do breed. And if this flatuositie or vapour doe struggle and wrestle within the cloud, from thence it commeth that thunderclaps be heard; but if it breake through still burning, then flieth out the thunderbolt: if it be longer time a struggling, and cannot pierce through, then leams and flashes are seene. With these, the cloud is clouen, with the other, burst in sunder. Moreover, thunders are nothing els but the blows and thumps giuen by the fires beating hard vpon the clouds: and therefore presently the fry chinkes and rifts of those clouds do glitter and shine. Possible it is also, that the breath and winde cleuated from the earth, being repelled back, and kept downe by the stars, & so held in and restrained within a cloud, may thunder, whiles Nature choketh the rumbling sound, all the while it strueth and quarelleth; but sendeth forth a crack when it breaketh out, as we see in a bladder puffed vp with winde. Likewise it may be, that the same wind or spirit whatsoeuer, is set on fire by fretting and rubbing, as it violently passeth headlong downe. It may also be stricken by the conflict of two clouds, as if two stones hit one against another; and so the leams and flashes sparkle forth, so as all these accidents happen by chance-medley, and be irregular. And hereupon come those bruitish & vain lightnings, such as haue no natural reason, but are occasioned by these impressions abovesaid. With these are mountains and seas smitten: and of this kind be all other blasts and bolts that do no hurt to liuing creatures. As for those that come from aboue, and of ordinary causes, yea, and from their proper stars, they alwaies preface and foretell future euent. In like manner as touching the windes, or rather blasts, I would not denie but that they may proceed from a dry exhalation of the earth, void of all moisture: neither is it impossible, but that they do arise out of waters, breathing and sending out an aire, which neither can thicken into a mist, nor gather into clouds: also they may be driuen by the ligitation and impulsion of the Sun, because the winde is conceiued to be nought els but the fluctuation and wauiing of the aire, and that by many means also: for some we see to rise out of riuers, firths, and seas, euen when they be stil and calme: as also others out of the earth, which winds they name *Altani*. And those verily when they come backe againe from the sea, are called *Tropai*: if they go onward, *Apogai*.

CHAP. XLIIII.

¶ *What is the reason of the resounding and doubling of the Echo.*

D Vt the windings of hils, and their often turnings, their many tops, their crests and ridges also bending like an elbow or broken, and arched as it were into shoulders, together with the hollow noukes of vallies, do cut vnequally the aire that reboundeth them fro: which is the cause of reciprocall voices called Echoes, answering one another in many places, when a man doth hoila or houe among them.

CHAP. XLV.

¶ *Of Windes againe.*

E Now there be certaine caues and holes which breed windes continually without end: like as that is one which we see in the edge of Dalmatia, with a wide mouth gaping, & leading to a deep downfall, into which if you cast any matter of light weight, be the day neuer so calm otherwise, there ariseth presently a stormie tempest like a whirle puffe. The places name is Senta. Moreover, in the prouince Cyrenaica there is reported to be a rock consecrated to the South-wind, which without prophanation may not be touched with mans hand; but if it be, presently the South wind doth arise and cast vp heaps of sand. Also in many houses there be hollow places deuised & made by mans hand for receipt of wind, which being inclosed with shade and darknesse, gather their blasts. Whereby we may see how all winds haue one cause or other. But great difference there is betweene such blasts and winds. As for these, they be settled and ordinarie, continually blowing, which, not some smal tractes & particular places, but whole lands do feele: which are not light gales nor stormy pusses, named *Aura* and *Procella*, but simply called winds, by the Masculine name *Venti*: which whether they arise by the continuall motion of the heauen, and the contrary course of the Planets; or whether this winde be that spirit of Nature that engendreth all things, wandering to and fro as it were in some wombe; or rather the

the aire, beaten and driuen by the vnlike influences and raies of the straying starres or planets, and the multiplicitee of their beames: or whether all winds come from their owne stars, namely these planets neerer at hand, or rather fall from them that be fixed in the firmament. Plaine and euident it is, that guided they by an ordinary law of Nature, not altogether vnknowne, although it be not yet thoroughly knowne.

CHAP. XLVI.

¶ The Natures and observations of the Winds.

He old Greeke writers, not so few as twentie, haue set downe and recorded their obseruations of the Winds. I maruell so much the more, that the World being so at discord, and diuided into kingdomes, that is to say, dismembred as it was, so many men haue had care to seek after these things, so intricate and hard to be found out, and namely in time of wars, and amid those places where was no safe lodging nor abode, and especially when pyrats and rousers, common enemies to mankind, held welneere all passages: I maruell, I say, that at this day each man in his owne tract and countrey taketh more light and true knowledge of some things by their commentaries and bookes, who neuer set foot there, than they doe by the skill and information of home-borne inhabitants; whereas now in time of so blessed and iolious peace, and vnder a prince who taketh such delight in the progresse of the State and of all good arts, no new thing is learned by farther inquisition, nay, nor so much as the inuentions of old writers are thoroughly vnderstood. And verily it cannot be said, that greater rewards were in those daies giuen, considering that the bountie of Fortunewas dispersed, and put into many mens hands: and in truth most of these deepe Clerkes and learned men, fought out these secrets for no other reward or regard, than to doe good vnto posteritie. But now, mens manners are waxen old and decay; now, all good customes are in the waine: and notwithstanding that the fruit of learning be as great as euer it was, and the recompences as liberall, yet men are become idle in this behalfe. The seas are open to all, an infinite multitude of saylers haue discovered all coasts whatsoeuer, they saile through and arriue familiarly at euery shore: all for gaine and lucre, but none for knowledge and cunning. Their mindes altogether blinded, and bent vpon nothing but couetousnesse, neuer consider that the same might with more safetie be performed by skill and learning. And therefore seeing there be so many thousand poore sailers that hazard themselves on the seas, I will treat of the winds more curiously and exquisitly than perhaps befeemes the present worke that is begun.

CHAP. XLVII.

¶ Many sorts of Winds.

En in old time obserued foure Windes only, according to so many quarters of the world (and therefore *Homer* nameth no more:) a blockish reason this was, as soone after it was iudged. The Age ensuing added eight more; and they were on the other side in their conceit too subtil and concise. The Modern sailers of late daies found out a meane betweene both: and they put vnto that short number of the first, foure windes and no more, which they tooke out of the later. Therefore euery quarter of the Heaven hath two windes apiece. From the equinoctiall Sunne-rising bloweth the East-winde *Sub-solanus*: from the rising thereof in the Mid-winter, the South-east *Vulturinus*. The former of these twaine the Greekes call *Apeliotes*, and the later *Eurus*. From the Mid-day, riseth the South winde: and from the Sun-setting in Mid-winter the South-west, *Africus*. They also name these two, *Notus* and *Libs*. From the Equinoctiall going down of the Sun, the West winde *Fauonius* commeth: but from that in Summer season, the North-west *Corus*. And by the same Greekes they are termed *Zephyrus* and *Argestes*. From the North waine or pole Arcticke, bloweth the North winde *Septentrio*: betweene which and the Sun, rising in Summer, is the North-east winde *Aquilo*, named *Aparctius* and *Boreas* by the Greekes. A greater reckoning than this for number, is brought in by some, who haue thrust in foure more betweene; namely, *Thracias* betweene the North and the Summer setting of the Sunne: in like manner

Cacias

A *Cacias* in the midst betweene the North-east *Aquilo*, and that of the Sun rising in the Equinoctiall *Sub-solanus*. Also, after the Sun-rising in Sommer, *Phenicias* in the midst, betweene the South-east and the South. Last of all, betweene the South and the South-west, *Lyborotus*, iust in the midst, compounded of them both, namely, betweene the Noonetead, and the Sun setting in Winter. But here they could not lay a straw, and see to make an end. For others haue set one more yet called *Mese*, betweene the North-east winde *Borias* and *Cacias*: also *Euronotus* betweene the South and the Southwest winds. Besides all these, there be some winds appropriate and peculiar to euery nation, which passe not beyond one certaine tract and region: as namely *Scyros* among the Athenians, declining a little from *Argestes* a winde vnknowne to other parts of Greece. In some other place it is more aloft, and the same then is called *Olympias*, as coming from the high hill *Olimpus*. But the vsuall and customable manner of speech vnderstandeth by all these names *Argestes* only. Some call *Cacias*, by the name of *Hellepontias*, and giue the same winds in sundry places diuers names. In the prouince likewise of *Narbone*, the most notorious winde is *Circius*, and for violence inferiour to none, driuing directly before it very often, the current at *Ostia*, into the *Ligurian* sea. The same winde is not only vnknown in all other climats of the heauen, but reacheth not so much as to *Vienna*, a citie in the same prouince. As great & boisterous a winde as he is otherwise, yet a restraint he hath before he come thither, and is kept within few bounds by the opposition of a meane and small hill. *Fabianus* also auouches, that the South winds enter not so far as into *Egypt*. Whereby, the law of Nature sheweth it selfe plainly, that euen windes haue their times and limits appointed.

C To proceed then, the Spring openeth the sea for sailers: in the beginning whereof, the West winds mitigate the Winter weather, at what time as the Sun is in the 25 degree of *Aquarius*: and that is the first day before the Ides of February. And this order holdeth in manner with all other winds, that I will set downe one after another, so that in euery leape yeare ye anticipate and reckon one day sooner, and then againe keep the same rule throughout all the foure yeares following. Some call *Fauonius* (which beginneth to blow about the 7 day before the Calends of March) by the name of *Chelidonius*, vpon the sight of the first Swallows, but many name it *O-rinthias*, comming the 71 day after the shortest day in winter, by occasion of the comming of birds: which wind bloweth for nine dayes. Opposite vnto *Fauonius* is the VVind which we called *Sub-solanus*. Vnto this VVind is attributed the rising of the *Vergilia* or seven stars, in as many degrees of *Taurus*, six daies before the Ides of May; which time is a southerly constitution: and to this Winde the North is contrarie. Moreouer, in the hottest season of the Sommer, the Dog-star ariseth, at what time as the Sun entrench into the first degree of *Leo*, which commonly is the 15 day before the Calends of August. Before the rising of this star for eight daies space or thereabout, the Northeast winds are aloft, which the Greekes call *Prodrumi*, i. forerunners. And two daies after it is risen, the same winds hold still more stiffely, and blow for the space of fortie daies, which they name *Etesia*. The Suns heate redoubled by the hotnesse of that star, is thought to be asswaged by them: and no winds are more constant, nor keep their set times better than they. Next after them come the Southerne winds againe, which are vsually vp, vntill the star *Arcturus* riseth, and that is nine daies before the Equinoctiall in Autumne. With it entereth *Corus*, and thus *Corus* beginneth the Autumne. And to this *Vulturinus* is contrarie. After that Equinoctiall, about 44 daies the *Virgilie* go downe, and begin winter, which season vsually falleth vpon the third day before the Ides of Nouember. This is the winter Northeast wind, which is far vnlike to that in Sommer, opposit and contrary to *Africus*. Now, a seven night before the Mid-winter day, and as much after, the sea is allaid and calmed for the sitting and hatching of the birds *Halciones*, whereupon these daies tooke the name *Alcionis*: the time behind, plaie the part of Winter. And yet these boisterous seasons full of tempests, shut not vp the sea: for pyrats and rousers at the first forced men with present perill of death, to run headlong vpon their death, and to hazard themselves in Winter seas; but now a daies couetousnesse causeth men to do the like.

F The coldest winds of all other, be those which we said to blow from the North-pole, and together with them their neighbor, *Corus*. These winds do both allay and still all others, and also scatter and driue away clouds. Moist winds are *Africus*, and especially the South wind of Italy called *Auster*. Men report also, that *Cacias* in *Pontus* gathereth & draweth to it selfe clouds. *Corus* and *Vulturinus* are dry, but onely in the end when they giue ouer. The Northeast and the North,

North, engender snow. The North winde also bringeth in haile, so doth *Cornus*. The South winde is exceeding hot and troublous withall. *Vulturnus* and *Favonius* be warme. They also be drier than the East: and generally all winds from the North and West are drier than from the South and East. Of all winds the Northern is most heathfull: the Southern wind is noisome, and the rather when it is drie; haply, because that when it is moist, it is the colder. During the time that it bloweth, liuing creatures are thought to be lesse hungry: the *Etesia* giue ouer ordinarily in the night, & arise at the third houre of the day. In Spaine and Asia they blow from the East: but in Pontus, from the North: in other quarters from the South. They blow also after the Mid-winter, when they be called *Orimbia*, but those are more milde, & continue fewer daies. Two there be that change their nature together with their site and place: the South winde in Affrick bringeth faire weather, and the North wind there is cloudy. All winds keep their course in order for the more part, or els when one ceaseth, the contrary beginneth. When some are laid, & the next to them do arise, they go about from the left hand to the right, according to the Sun. Of their manner and order monthly, the prime or fourth day after the change of the Moone, doth most commonly determine. The same windes will serue to faile contrariwise, by means of setting out the failes: so as many times in the night, ships in sailing run one against another. The South winde raiseth greater billowes and more surging waues than the North: for that the South wind ariseth below from the bottome of the Sea; the other blustereth aloft, and troubleth the top of the water. And therefore after Southern winds, earth-quakes are most hurtful. The South wind in the night time is more boisterous, the Northerne wind in the day. The winds blowing from the East, hold and continue longer than those from the West. The Northern winds giue ouer commonly with an odde number: which obseruation serueth to good vse in many other parts of naturall things, and therefore the male winds are iudged by the odde number. The Sun both raiseth, and also laith the windes. At rising and setting hee causeth them to be aloft: at noon-tide he represseth and keepeth them vnder, in Summer time. And therefore at mid-day or mid-night commonly the winds are down and lie still, for both cold and heat if they be immoderate, do spend and consume them. Also rain doth lay the winds: and most commonly from thence they are looked for to blow, where clouds break and open the skie to be seen. And verily *Endoxus* is of opinion (if wee list to obserue the least reuolutions) that after the end of euery fourth yere, not onely all winds, but other tempests and constitutions also of the weather, return again to the same course as before. And alwaies the Lustrum or computation of the five yerres beginneth at the leap yere, when the Dog-star doth arise. Thus much touching general winds.

CHAP. XLVIII.

¶ Of sudden Blasts.

Now wil we speake of sudden blasts, which being risen (as hath bin said before) by exhalations of the earth, and cast downe againe; in the meane while appeare of many fashions; enclosed within a thin course of clouds newly ouercast. For such as be vnconstant, wandering, and rushing in manner of land fouds (as some men were of opinion, as wee haue shewed) bring forth thunder and lightening. But if they come with a greater force, sway, and violence, and withall burst and cleaue a dry cloud asunder all abroad, they breed a storme, which of the Greeks is called *Ecnephias*; but if the clift or breach be not great, so that the wind be constrained to turne round, to roll and whirle in his discent, without fire (i.e.) lightening, it makes a whirle-puffe or ghuft called *Typhon* (i.e.) the storme *Ecnephias* aforesaid, sent out with a winding violence. This takes with it a peece broken out of a congealed cold cloud, turning, winding, and rolling it round, and with that weight maketh the owne fall more heauie, and changeth from place to place with a vehement and sudden whirling; the greatest danger and mischief that poore sailers haue at sea, breaking not onely their crosse saile yards, but also writhing and bursting in peeces the very ships; and yet a small matter is the remedy for it, namely, the casting of vinegre out against it as it commeth, which is of nature most cold. The same storme beating vpon a thing, is it selfe smitten backe againe with a violence, and snatcheth vp whatsoeuer it meeteth in the way aloft into the skie, carrying it back, and swallowing it vpon high. But if it breake out from a greater hole of the said cloud, by it so borne down, and yet not altogether so broad as the abouenamed storm *Procella* doth, nor without a cracke; they call this boisterous winde

A wind *Turbo*, casting downe and ouerthrowing all that is next it. The same, if it be more hot and catching a fire as it rageth, is named *Prester*, burning, and withall laying along, whatsoeuer it toucheth and encountereth.

CHAP. XLIX.

¶ Other enormous Kindes of Tempests.

NO *Typhon* commeth from the North, ne yet any *Ecnephias* with snow, or while snow lieth on the ground. This tempestuous winde, if when it brake the cloud burned light withall, hauing fire of the owne before, and caught it not afterward, it is very lightning; and differeth from *Prester*, as the flame from a cole of fire. Againe, *Prester* spreadeth broad with a flash and blast; the other gathereth round with forcible violence. *Typhon* moreover or *Vortex*, differeth from *Turben* in flying backe, and as much as a crash from a cracke. The storme *Procella* from them both, in breadth: and to speake more truly, rather scattereth than breaketh the cloud. There riseth also vpon the sea a darke mist, resembling a monstrous beast; and this is euer a terrible cloud to sailers. Another likewise called a Columne or Pillar, when the humour and water ingendred is so thicke and stiffe congealed, that it standeth compact of it selfe. Of the same sort also is that cloud which draweth water to it, as it were into a long pipe.

CHAP. L.

¶ In what Lands Lightnings fall not.

IN Winter and Summer seldome are there any Lightnings, and that is long of contrary causes: because in Winter the aire is driuen close together, and thickened with a deeper course of clouds: besides, all the exhalations breathing and rising out of the earth, being stark congealed, and frozen hard, do extinguish cleane what fire vapour soeuer otherwise they receiue: which is the reason that Scythia and other cold frozen quarters thereabout, are free from lightnings. And *Aegypt* likewise vpon the contrarie cause, and exempt from Lightnings; namely, exceeding heate: for the hot and dry exhalations of the earth, gather into very slender, thin, and weeke clouds. But in the Spring and Autumne, lightnings are more rise; because in both those seasons, the causes as well of Summer as Winter, are confused and corrupt. And this is the reason also, that lightnings are common in our Italie; for that the aire being more moueable and waivering, by reason of a kinder Winter and a cloudie Summer, is alwaies of the temperature of Spring or Autumne. In those parts also of Italy which lie off from the North, and encline to warmth (as namely in the tract about Rome and Campania) it lightneth in Winter and Summer alike, which happeneth in no other part thereof.

CHAP. LI.

¶ Sundry sorts of Lightnings, and Wonders thereof.

VERIE many Kindes of Lightnings are set downe by Authors. Those that come drie, burne not at all, but onely dissipate and disperse. They that come moist, burne not neither, but blast things, and make them looke dusky. Now a third kinde there is, which they call Bright and Cleare, and that is of a most strange and wonderfull nature; whereby tuns and such like vessels are drawne drie, and their sides, hoops, and heads, neuer toucht therewith or hurt, nor any other shew and token thereof is left behinde: Gold, copper, and siluer money is melted in the bags, and yet the very bags no whit scorched, no nor the wax of the seale hurt and defaced, or put out of order. *Martia* a noble Ladie of Rome being great with childe, was stricke with lightning: the childe she went withall was killed within her, and she without any harme at all liued still. Among the *Cailline* prodigies it is found vpon Record, that *M. Herennius* (a Counsellor and Staes-man of the incorporate towne Pompeianum) was in a faire and cleare day smitten with Lightning.

THe Antient Tuscans by their learning do hold, that there be nine gods that send forth Lightnings, and those of eleuen sorts: for *Iupiter* (say they) casteth three at once. The Romans haue obserued two of them, and no more; attributing those in the day time to *Iupiter*; and them in the night to *Summanus* or *Pluto*. And these verily be more rare, for the cause aforesaid; namely, the coldnesse of the aire aboue. In *Hetruria*, they suppose that lightnings break also out of the earth, which they call *Inferaj*. Infernall, and such be made in Mid-winter. And these they take to be terrene and earthly, and of all most mischieuous and execrable: neither be those generall and vniuersall lightnings, nor proceeding from the stars, but from a very neere and more troubled cause. And this is an euident argument for distinction, that all such as fall from the vpper skie aboue, strike a slant and side-wise: but those which they call earthly, smite straight and directly. But the reason why these are thought to issue forth of the earth is this; because they fall from out of a matter nearer to the earth, forasmuch as they leaue no markes of a stroke behind: which are occasioned by force not from beneath, but comming full against. Such as haue searched more subtilly into these matters, are of opinion, that these lightnings come from the Planet *Saturne*, like as the burning lightning from *Mars*: And with such lightning was *Volfinij* (a most welthy citie of the Tuscans) burnt full and whole to ashes. Moreover, the Tuscans call those lightnings Familiar, which presage the fortune of some race, and are significant during their whole life: and such are they that come first to any man, after he is newly entred into his owne patrimonie or familie. Howbeit their iudgement is, that these priuat lightnings are not of importance and fore-tokening aboue ten yerres; vnlesse they happen either vpon the day of first marriage, or of wedding. As for publique lightnings, they be not of force aboue 30 yerres, except they chance at the very time that townes or colonies be erected and planted.

CHAP. LIII. ¶ Of raising or calling out Lightnings by Coniuration.

IT appeareth vpon record in Chronicles, that by certaine sacrifices and prayers, Lightnings may be either compelled or easily intreated to fall vpon the earth. There goeth a report of old in *Hetruria*, that such a lightning was procured by exorcismes and coniuurations, when there entered into the citie *Volfinij* (after all the territory about it was destroyed) a moaster which they named *Volta*. Also, that another was raised and coniuured by *Porfenna* their King. Moreover, *L. Piso* (a writer of good credit) reporteth in his first booke of *Annales*, that *Numa* before him praesided the same feat many a time and often: and when *Tullus Hostilius* would haue imitated him and done the like (for that he obserued not all the ceremonies accordingly) was himselfe stricke and killed with lightning. And for this purpose, sacred groues we haue and altars, yea and certaine sacrifices due thereto. And among the *Iupiters* surnamed *Statores*, *tonantes*, and *Feretri*, we haue heard that one also was called *Elicius*. Sundry and diuers are mens opinions as touching this point, and euery man according to his owne liking and fancie of his minde. To beleuee that Nature may be forced and commanded, is a very audacious and bold opinion: but it is as blockish on the other side, and fencelesse, to make her benefites of no power and effect; considering that in the interpretation of Lightning, men haue thus farre forth proceeded in skill and knowledge, as to foretell when they will come at a set and prescript day: and whether they will fordoe and frustrate the dangers pronounced, or rather open other destinies, which lie hidden: and an infinite sort of publicke and priuat experiments of both kinds are to be found. And therefore (since it hath so pleased Nature) let some men be resolued herein, and others doubtfull: some may allow thereof, and others condemne the same. As for vs, we will not omit the rest which in these matters are worth remembrance.

CHAP. LIIII. ¶ Generall rules of Lightning.

That the Lightning is scene before the Thunderclap is heard, although they come indeed jointly both together, it is certainly knowne. And no maruell, for the eye is quicker to see light, than the eare to heare a sound. And yet Nature doth so order the number and measure,

A measure, that the stroke and the sound should accord together. But when there is a noise, it is a signe of the lightning proceeding of some naturall cause, and not sent by some god: and yet furthermore this is a breath or wind that commeth before the thunderbolt: and hereupon it is, that euery thing is shaken and blasted: ere it be smitten; neither is any man stricken, who either saw the lightning before, or heard the thunderclap. Those lightnings that are on the left hand, be supposed to be luckie and prosperous, for that the East is the left side of the world: but the coming therof is not so much regarded as the return, whether the fire leap back attendeth the stroke giuen; or whether after the deed done and fire spent, the spirit and blast aboue fall downe backe againe. In that respect the Tuscans haue diuided the heauen into 16 parts. The first is from the North to the Sun rising in the Equinoctiall line: the second, to the Meridian line, or the South: the third, to the Sun setting in the Equinoctiall: and the fourth taketh vp all the rest from the said West to the North star. These quarters againe they haue parted into foure regions apiece: of which eight from the Sun rising they called the Left, & as many again from the contrary part the Right. Which considered, most dreadfull and terrible are those lightnings, which from the Sun setting reach into the North; and therefore it skilleth very much, from whence lightnings come, and whither they go: the best thing obserued in them is, when they return into the Easterly parts. And therefore when they come from that first and principall part of the skie, and haue recourse again into the same, it is holden for passing good hap: & such was the signe and token of victories giuen (by report) to *Sylla* the Dictator. In all other parts of the element they be lesse fortunate or fearful. They that haue written of these matters, haue delineated in writing, that there be lightnings, which to vtter abroad is held vnlawful, as also to giue care vnto them, if they be disclosed, vnlesse they be declared either to parents, or to a friend and guest. How great the vanity is of this obseruation, was at Rome, vpon the blasting of *Tunoes* temple, found by *Scaurus* the Consull, who soone after was President of the Senate. It lightneth without thunder, more in the night than day time. Of all creatures that haue life and breath, man only it doth not alwaies kill; the rest, it dispatcheth presently. This priuiledge & honour we see Nature hath giuen to him; whereas otherwise so many great beasts surpass him in strength. All other creatures smitten with lightning, fall downe vpon the contrary side; man onely (vnlesse he turne vpon the parts stricken) dyeth not. Those that are smitten from aboue vpon the head, lie downe and sinke directly. He that is stricken watching, is found dead with his eyes winking and close shut, but whose eie is smitten sleeping, is found open eyed. A man thus comming by his death, may not by law be burned: Religion hath taught, that he ought to be entred and buried in the earth. No liuing creature is set a fire by lightning, but it is breathlesse first. The wounds of them that be smitten with thunderbolts, are colder than all the body besides.

CHAP. LV.

¶ What things are not smitten with Lightning.

EOF all those things which grow out of the earth, Lightning blasteth not the *Layrell* tree; nor entrench at any time aboue fise foot deep into the ground; and therefore, men fearful of lightning, suppose the deeper caues to be the surest and most safe: or els booths made of skins of sea-beasts, which they call *Seales*, or *Sea-calues*; for of all creatures in the sea, this alone is not subiect to the stroke of lightning; like as of all flying foules the Eagle, (which for this cause is imagined to be the armour-bearer of *Iupiter*, for this kinde of weapon.) In *Italie* betwene *Tarracina* and the temple of *Feronia*, they gaue ouer in time of warre, to make towers and forts; for not one of them escaped, but was ouerthrowne with lightning.

CHAP. LVI.

¶ Of strange and prodigious raine, to wit, of Milke, Bloud, Flesh, Iron, Wooll, Tyles, and Bricks.

BESIDES these things aboue, in this lower region vnder heauen, we finde recorded in monuments, that it rained milke and bloud, when *M. Acilius* and *C. Porcius* were Consuls. And many times else besides it rained flesh, as namely, whiles *L. Volturnius* and *Serv. Sulpitius*

Pittius were Consuls: and look what of it the fowles of the aire caught not vp nor carried away, it neuer putrified. In like manner, it rained yron in the Lucanes countrey, the yere before that *M. Crassus* was slaine by the Parthians, and together with him all the Lucanes his souldiers, of whom there were many in his army. That which came downe in this raine resembled in some sort Sponges: and the Wisards and Southlayers being sought vnto, gaue warning to take heed of wounds from aboue. But in the yere that *L. Paulus*, and *C. Marcellus* were Consuls, it rained wooll about the Castle Carissa, neare to which a yere after, *T. Annus Milo* was slaine. At the time that the same *Milo* pleaded his owne cause at the bar, there fell a raine of tyles and bricks, as it is to be seen in the Records of that yere.

CHAP. LVII.

¶ *Of the rustling of Armour and sound of Trumpets heard from Heauen.*

IN the time of the Cimbrian warres, we haue bin told, that Armour was heard to rustle, and the trumpet to sound out of heauen. And this happened very often both before and after those wars. But in the third Consulship of *Marius*, the Amerines and Tudertes saw men in armes in the skie, rushing and running one against another from the East and West, and might behold those of the West discomfited. That the very firmament it selfe should be of a light fire, it is no maruel at all; for oftentimes it hath been seene, when clouds haue caught any greater deale of fire.

CHAP. LVIII.

¶ *Of Stones falling downe from the Skie.*

AMong the Greeks there is much talke of *Anaxagoras Clazomenius*, who by his learning and skill that he had in Astronomie, foretold in the second yere of the 78 Olympias, what time a stone should fall from out of the Sun: and the same happened accordingly in the day time, in a part of Thracia neere the riuier Aegos; which stone is shewed at this day as big as a waine load, carrying a burnt and adust colour: at what time as a comets or blazing starre also burned in those nights. Which if any man beleue that it was fore-signified, must needs also confesse, that this diuinitie or fore-telling of *Anaxagoras* was more miraculous and wonderfull than the thing it selfe: and then farewell the knowledge of Natures workes, and welcome confusion of al; in case we should beleue that either the Sun were a stone, or that euer any stone were in it. But, that stones fall oftentimes downe, no man will make any doubt. In the publicke place of Exercise in Abydos, there is one at this day vpon the same cause preferred and kept for to be seene, and held in great reuerence: it is but of a meane and small quantitie, yet it is that which the selfe same *Anaxagoras* (by report) fore-signified that it should fall in the mids of the earth. There is one also at *Cassandria*, which was in old time vsually called *Potidea*, a colony from thence deducted. I my selfe haue seene another in the territorie of the Vocantians, which was brought thither but a little before.

CHAP. LIX. ¶ *Of the Rainbow.*

THose which we call Rain-bowes are seene often without any wonder at all, or betokening any great matter: for they portend not so much as rainy or faire daies, to trust vpon. But manifest it is, that the Sun beames striking vpon an hollow cloud, when their edge is repelled, are beaten backe against the Sun: and thus ariseth varietie of colours by the mixture of clouds, aire, and fire light together. Certes, they neuer are knowne but opposite to the Sun; nor at any time otherwise than in forme of a Semicircle: ne yet in the night season, although *Aristotle* saith there was a Rain-bow seen by night: howbeit he confesseth, that it could not possibly be but at the full of the Moone. Now they happen for the most part in winter, namely from the Autumne Equinoctiall, as the daies decrease and wax shorter. But as daies grow longer againe, that is to say, after the Spring Equinoctiall, they be not seene no more than about the Summer Sunstead, when daies are at longest. But in Bruma, namely when they bee shortest

A test, they chance very often. The same appeare aloft, when the Sun is low, and below, when he is aloft. Also, they be of narrower compass, when the Sun either riseth or setteth, but their body spreadeth broad: and at noone narrower it is, and smal, yet greater and wider in circumference. In Sommer time they be not seene about noon-tide, but after the Autumne Equinoctiall, at all houres; and neuer more at once than twaine. The rest of the same nature I see few men doe make any doubt of.

CHAP. LX.

¶ *Of Haile, Snow, Frost, Mist, and Dew.*

HAile is ingendred of Raine congealed into an Ice: and Snow of the same humor growne together, but not so hard. As for frost, it is made of dew frozen. In winter Snowes fall, and not haile. It haileth oftner in the day time than in the night, yet haile sooner melteth by farre than snow. Mists be not seene neither in Summer, nor in the cold weather. Dewes shew not either in frost, or in hot seasons; neither when winds be vp, but only after a calm and cleere night. Frosts dry vp wet and moisture; for when the yce is thawed and melted, the like quantitie of water in proportion is not found.

CHAP. LXI.

¶ *Of the Shapes of Clouds.*

SVndry colours and diuers shapes are seene in clouds, according as the fire intermingled therein is either more or lesse.

CHAP. LXII.

¶ *Of the properties of weather in diuers places.*

Moreouer, many properties there be of the weather, peculiar to certain places: the nights in Africke bedewie in Winter. In Italy, about Locri and the lake Velinus, there is not a day but a Rainbow is seene. At Rhodes and Syracusa, the aire is neuer so dimme and cloudy, but one houre or other the Sun shineth out. But such things as these shall be related more fitly in due place. Thus much of the Aire.

CHAP. LXIII.

¶ *Of Earth, and the nature thereof.*

THE Earth followeth next: vnto which alone of all parts of the world, for her singular benefits we haue giuen the reuerend and worshipfull name of Mother. For like as the Heauen is the (mother) of God, euen so is she of men. She it is that taketh vs when wee are comming into the world, nourisheth vs when we are new borne: and once being come abroad, euer susteineth and beareth vs vp: and at the last when wee are reiectd and forlorne of all the world besides, she embraceth vs: then most of all other times, like a kinde mother, she couereth vs all ouer in her bosom; by no merit more sacred than by it, wherewith she maketh vs holy and sacred; euen bearing our tombes, monuments, and titles, continuing our name, and extending our memorie, thereby to make recompence and weigh against the shortnes of our age: whose last power we in our anger wish to be heauy vnto our enemy, and yet she is heauy to none, as if wee were ignorant that she alone is neuer angry with any man: waters ascend vp, & turn into clouds, they congeale and harden into haile, swel they do into waues and billows, & down they hasten headlong into brooks and land-floods. The aire is thickened with clouds, & rageth with winds and stormes. But she is bountifull, mild, tender ouer vs, & indulgent, ready at all times to attend and wait vpon the good of mortall men. See what she breeds being forced! nay, what she yeeldeth of her owne accord! what odoriferous smells, and pleasant fauors! what wholesome iuices and liquors, what soft things to content our feeling, what louely colors doth she giue to please our eie, how faithfully and iustly doth she repay with vsury that which was lent and credited out vnto her! Finally, what store of all things doth shee feed and nourish for our sake! Alas

poor wretch, pestiferous and hurtfull creatures, when the vitall breath of the aire was too blame to giue them life, she could not otherwise chuse but receiue them, after they were sown in her, and being once ingendred and bred, keepe and maintain them. But in that they proued afterwards bad and venomous; the fault was to be laid vpon the parents that ingendred them, and not to be imputed vnto her. For, shee entertaineth no more a venomous serpent after it hath stung a man: nay, more than that, she requirerth punishment, for them that are slow and negligent of themselves to seeke it. Shee it is that bringeth forth medicinable herbes, and euermore is in trauell to be deliuered of some thing or other, good for man.ouer and besides, it may be thought and beleueed, that for very pittie of vs shee ordained and appointed some poisons, that when we were weary of our life, cursed famine (most aduerser and crosse of all other to the merits of the earth) should not consume and waste vs with languishing and pining consumption, and so procure our death; that high and steepe rockes should not dash and crush our bodies in pieces; nor the ouerthwart and preposterous punishment by the halter, wreath our necks, and stop that vital breath which we seek to let out and be rid of: last of all, that we might not worke our owne death in the deep sea, and being drowned feed fishes, and be buried in their bellies, ne yet the edge and point of the sword cut and pierce our bodie, and so put vs to dolorous paine. So that it is no doubt, but in a pittifull regard and compassion of vs, shee hath ingendred that poyson, by one gentle draught whereof, going most easily downe, we might forgoe our life, and die without any hurt and skin broken of our body, yea, and diminish no one drop of blood: without grievous paine, I say, and like onely to them who be athirst: that being in that manner dead, nether soule of the aire, nor wilde beast prey vpon or touch our bodies, but that he should be referued for the earth, who perished by himselfe and for himselfe: and, to confesse and say the troth, the earth hath bred the remedy of all miseries, howsoeuer we haue made it a venome and poyson to our life. For after the like sort we employ iron and Steele, which we cannot possibly be without. And yet we should not do well and iustly to complain, in case shee had brought it forth for to do hurt and mischief. Now surely to this only part of Nature and the world, we are vnthankfull, as though shee serued not mans turne for all dainties; not for contumely and reproch to be misused. Cast shee is into the sea, or else to let in peeres and frithes, eaten away with water. With yron tooles, with wood, fire, stone, burdens of corne tormented shee is euery houre: and all this much more to content our pleasures and wanton delights than to serue vs with naturall food and necessary nourishment. And yet these misusages which shee abideth aboue, and in her outward skin, may seeme in some sort tolerable. But we, not satisfied therewith, pierce deeper and enter into her very bowels, we search into the veines of gold and siluer, we mine and dig for copper and lead mettals. And for to seek out gemmes and some little stones, we sinke pits deep within the ground. Thus we plucke the very heart-strings out of her, and all to weare on our finger one gemme or precious stone, to fulfill our pleasure and desire. How many hands are worne with digging and deluing, that one ioynt of our finger might shine again. Surely, if there were any diuels or infernall spirits beneath, ere this time verily these mines (for to feed couetousnes and riot) would haue brought them vp aboue ground. Maruell we then, if shee hath brought forth some things hurtfull and noisome? But sauage beasts (I well thinke) ward and saue her, they keepe sacrilegious hands from doing her iniurie. Nay ywis it is nothing so. Dig we not amongst dragons and serpents: and together with veines of gold, handle we not the roots of poisoned and venomous herbes? howbeit this goddesse we finde the better appaied, and lesse discontented for all this misusage, for that the end and issue of all this wealth tends to wickednesse, to murder and wars, and her whom we drench with our blood, we couer also with vnburied bones. Which neuertheless, as if shee did reprocue and reproch vs for this rage and furie of ours, shee her selfe couereth in the end, and hideth close euen the wicked parts of mortall men. Among other imputations of an vnthankfull minde, I may well count this also, That we be ignorant of her nature.

CHAP. LXIII. ¶ *Of the forme of the earth.*

THe first and principall thing that offereth it selfe to be considered, is her figure, in which by a generall consent we doe all agree. For surely we speake and say nothing more commonly, than the round ball of the earth; and confesse that it is a globe enclosed within 2 poles. But yet the forme is not of a perfect and absolute roundle, considering so great height

A of hills and such plaines of downs: howbeit, if the compasse thereof might be taken by lines, the ends of those lines would meet iust in circuit, and proue the figure of a iust circle. And this the very consideration of naturall reason doth force and conuince, although there were not those causes which we alledged about the heauen. For in it the hollow bending conuexitie boweth and beareth vpon it selfe, and euery way resteth vpon the centre thereof, which is that of the earth. But this, being solid and close compact, ariseth still like as if it swelled, stretching and growing forth. The heauen bendeth and inclineth toward the centre, but the earth goeth from the centre, whiles the world with continuall volubilitie and turning about it, driueth the huge and excessive globe thereof into the forme of a round ball.

CHAP. LXV.

¶ *Of the Antipodes, whether there be any such. Also of the roundnesse of water.*

Much adoe there is here, and great debate betwene learned men; and contrariwise those of the leaud and ignorant multitude: for they hold, that men are ouerspread on all parts vpon the earth, and stand one against another, foot to foot: also that the Zenith or point of the heauen is euen and alike vnto all: and in what part soeuer men be, they go still and tread after the same manner in the midst. But the common sort aske the question and demand, How it happeneth that they opposite iust against vs fall not into Heauen? as if there were not a reason also ready, That the Antipodes againe shall maruell why we fell not downe. Now there is reason that commeth betwene, carrying a probabilitie with it euen to the multitude, were it neuer so blockish and vnapt to learne; That in an vneuen and vnequall Globe of the Earth, with many ascents and degrees, as if the figure thereof resembled a Pine-apple; yet neuertheless it may be well enough inhabited all ouer in euery place. But what good doth all this, when another wonder as great as it ariseth? namely, That it selfe hangeth, and yet falleth not together with vs: as if the power of that Spirit especially which is enclosed in the World were doubted: or that anything could fall, especially when nature is repugnant thereto, and affordeth no place whither to fall: for like as there is no seat of Fire, but in fire; of Water, but in water; of Aire and Spirit, but in aire; euen so, there is no roome for Earth but in earth, seeing all the Elements besides, are ready to put it backe from them. Howbeit, wonderfull it remaineth still, How it should become a Globe, considering so great flatnesse of Plaines and Seas! Of which doubtfull opinion, *Dicaearchus* (a right learned man as any other) is a fauourer; who, to satisfie the curious endeaours of Kings and Princes, had a charge and commission to leuell and take measure of mountaines: of which he said, that Pelion the highest, was a mile and a halfe high by the plumbe rule; and collected thereby, that it was nothing at all to speake of, in comparison of the vniuersall rotunditie of the whole. But surely in my conceit, this was but an vncertaine guesse of his, since that I am not ignorant, that certaine tops of the Alpes, for a long tract together, arise not vnder fiftie miles in heighth.

But this is it that troubles the vulgar sort most of all, if they should be forced to beleue, that the forme of water also gathers round in the top. And yet there is nothing in the whole world more euident to the sight, for the drops euery where not onely as they hang, appeare like little round bals, but also if the light vpon dust, or rest vpon the hairy downe of leaues, we see they keep a perfect and exquisite roundnes. Also in cups that are filled brim full, the middle part in the top swell most. Which thing considering the thinnes of the humour, and the softnes thereof settling flat vpon it selfe, are sooner found out by reason, than by the eie. Nay, this is a thing more wonderfull, that when cups are filled to the full, put neuer so little more liquor thereto, the ouerplus will run ouer all about: but contrariwise it falleth out, if you put in any solid weights, yea, and it were to the weight of twenty deniers or French crowns in a cup. Forsooth the reason is this, for that these things receiued within lift vp the liquor aloft to the top, but poured vpon the tumour that beareth aloft aboue the edges, they must needs glide off and run by. The same is the reason why the land cannot be seen by them that stand vpon the hatches of the ship, but very plainly at the same time from the top of the masts. Also as a ship goeth a far off from the land, if any thing that thineth and giueth light be fastened to the top-gallant, it seemeth from the land side to goe downe and sinke into the sea by little and little, untill at last it be hidden cleane.

clean. Last of all the very Ocean, which we confesse to be the vtmost and farthest bound enuironing the whole globe, by what other figure else could it hold together, and not fall downe, since there is no other banke beyond it to keepe it in? And euen this also is as great a wonder, how it commeth to passe, although the sea grow to be round, that the vtmost edge thereof falleth not downe? Against which, if the seas were euen, flat, and plaine, and of that forme as they seem to be, the Greeke Philosophers to their own great ioy and glory do conclude, and proue by Geometricall subtil demonstration, that it cannot possibly be that the waters should fall. For seeing that waters run naturally from aloft to the lower parts, and that all men confesse, that this is their nature, and no man doubteth that the water of the sea came euer in any shore so far as the deuexitie would haue suffered; doubtlesse it appeares, that the lower a thing is, the neerer it is to the centre; and that all the lines which from thence are sent out to the next waters, are shorter than those which from the first waters reach to the vtmost extremitie of the sea. Hereupon the whole water from euery part thereof bends to the centre, and therefore falls not away, because it inclines naturally to the inner parts. And this we must beleue that Nature the work-mistresse framed and ordained so, to the end that the earth being dry, could not by it selfe alone, without some moisture keepe any consistence; and the water likewise could not abide and stay vnlesse the earth vpheld it; in which regard they were mutually to embrace one another, and so be vnited, whiles the one opened all the creeks and nouks, and the other ran wholly into the other, by means of secret veins within, without, and aboue, like ligaments to claspe it, yea, and so break out at the vtmost tops of hils; whether being partly caried by a spirit, and partly exprest forth by the ponderositie of the earth, it mounteth as it were in pipes: and so far is it from danger of falling away, that it leapeth vp to the highest and loftiest things that be. By which reason it is euident also, why the seas swell not and grow, notwithstanding so many riuers daily run into them.

CHAP. LXXVj.

¶ How the matter is vnited and knit to the earth.

THe earth therefore in his whole globe is in the midst thereof, hemmed in by the sea running round about it. And this need not to be sought out by reason and argument, for it is knowne already by good prooue and experience.

CHAP. LXXvij.

¶ Nauigation vpon the sea and great Riuers.

From Gades and Hercules pillars, the West sea is at this day nauigable and sailed all ouer euen the whole compasse of Spaine and France. But the North Ocean was for the most part disconered vnder the conduct of *Augustus Caesar* of famous memorie, whowith a fleet compassed all Germanie, and brought it about as far as to the cape of the Cimbrians: and so from thence hauing kenned and viewed the vast and wide sea, or else taken notice thereof by report, he passed to the Scythian Clymat and those cold coasts, frozen, and abounding with too much moisture. For which cause there is no likelihood that in those parts the seas are at an end, whereas there is such excessiue wet that all stands with water. And neere vnto it from the East, out of the Indian sea, that whole part vnder the same clyme of the world which bendeth vnder the Caspian sea, was sailed throughout by the Macedonian armies, when *Seleuchus* and *Antiochus* reigned, who would needs haue it so, that *Seleuchus* and *Antiochus* should beare their names. About the Caspian sea also many coasts and shores of the Ocean haue bin discovered, and by piece-meale rather than all whole at once, the North of one side or other hath been failed or rowed ouer. But yet to put all out of coniecture, there is a great argument collected out of the Mere Mæotis, whether it be a gulfe and arme of that Ocean (as I know many haue beleueed) or an ouerflowing of the same, and diuided from it by a narrow piece of the continent. In another side of Gades, from the same West, a great part of the South or Meridian gulfe round about Mauritania is at this day sailed. And the greater part verily of it, like as of the East also, the victories of *Alexander the Great* viewed and compassed on euery side, euen as farre as vnto the Arabian Gulfe. Wherein when *Caius Caesar*, the sonne of *Augustus*, warred,

A warred in those parts, the marks and tokens by report were seen remaining after the Spaniards shipwracke. *Hanno* likewise in the time that Carthage flourished in puissance sailed round about from Gades to the vtmost bounds and lands end of Arabia, and set downe that his voyage in writing. Like as also *Himilco* was at the same time sent out in a voyage to discover the vtter coasts of Europe. Moreouer, *Cornelius Nepos* writeth, that in his time one *Eudoxius* a great sailer, at what time he fled from King *Lathyrus*, departed out of the Arabian gulfe, and held on his course as far as Gades. Yea, and *Celins Antipater* long before him reporteth, that he saw the man who had sailed out of Spain to Æthiopia for traffique of merchandise. The same *Nepos* maketh report as touching the compassing about of the North, That vnto *Qu. Metellus Celer*, **B** Colleague to *C. Afranius* in the Consulship, but at that time Proconsull in Gaule; certain Indians were giuen by a King of the Sueuians, who as they sailed out of India for traffick as merchants, were driuen by tempests, and cast vpon Germanie. Thus the seas flowing on all sides about this globe of the earth, diuided and cut into parcels, becaue vs of a part of the world, so as neither from thence hither, nor from hence thither there is a thorow-faire and passage. The contemplation whereof seruing fit to discover and open the vanitie of men, seemes to require and challenge of me, that I should proiekt to the view of the eye, how great all this is, whatsoever it be, and wherein there is nothing sufficient to satisfie and content the feuerall appetite of each man.

CHAP. LXXvij.

¶ What portion of the earth is habitable.

Now first and formost me thinks men make this reckoning of the earth, as if it were the iust halfe of the globe, and that no portion of it were cut off by the Ocean: which notwithstanding, clasping round about all the midst thereof, yeelding forth and receiuing againe all other waters besides, and what exhalations sweeter that go out for clouds, and feeding withall the very stars, so many as they be, and of so great a bignesse, what a mighty space thinke you will it be thought to take vp and inhabit, and how little can there be left for men to inhabit? surely the possession of so vast and huge a deale must needs be exceeding great and infinite. What say you then to this, That of the earth which is left the heauen hath taken away the greater part? For whereas there be of the heauen siue parts, which they call Zones, all that lieth vnder the two vtmost, to wit, on both sides about the poles, namely this here, which is called *Septentrio*, that is to say, the North, and the other ouer against it, named the South, it is overcharged with extreme and rigorous cold, yea, and with perpetuall frosts and ice. In both Zones it is alwaies dim and darke, and by reason that the aspect of the more milde and pleasant planets is diuerted cleane from thence, the light that is, sheweth little or nothing, and appeareth white with the frost onely. Now the middle of the earth, whereas the Sun hath his way, and keepeth his course, scorched and burnt with flames, is euen parched and fried againe with the hot gleames thereof, being so neere. Those two only on either side about it, namely betweene this burnt Zone and the two frozen, are temperate; and euen those haue not accessse and passage the one to the other, by reason of the burning heate of the said planet. Thus you see that the heauen hath taken from the earth three parts, and what the Ocean hath plucked from it besides no man knoweth. And euen that one portion remaining vnto vs, I wot not whether it be not in greater danger also. For the same Ocean entring, as we will shew, into many armes and creeks, keepeth a roaring against the other gulfes and seas within the earth, and so neere comes vnto them, that the Arabian gulfe is not from the Egyptian sea about 115 miles: the Caspian likewise from the Ponticke but 375. Yea, and the same floweth between, and entrench it into so many armes, as that thereby it diuideth Africke, Europe, and Asia asunder. Now what a quantity of land it taketh vp may be collected and reckoned at this day, by the measure and proportion of so many riuers, and so great Meres. Adde thereto both Lakes and pooles, **F** and withall take from the earth the high mountaines bearing vp their heads aloft into the sky, so as the eye can hardly reach their heights: the woods besides, and steepe descents of the valleys, the Wildernesces, and waste wildes left desart vpon a thousand causes. These so many pieces of the earth, or rather, as most haue written, this little-pricke of the world (for surely the earth is nothing else in comparifon of the whole) is the only matter of our glory. This, I say,

is the very feat thereof: here we seeke for honors and dignities; here we exercise our rule and G
authoritie: here we couet wealth and riches: here all mankind is set vpon stirs and troubles;
here we raise ciuill wars still one after another, and with mutuall massacres and murders wee
make more roome in the earth. And to let passe the publique furious rages of nations abroad,
this is it, wherein we chafe and drue out our neighbor borderers, and by stealth dig turfe from
their soile to put vnto our owne: and when a man hath extended his lands, and gotten whole
countries to himselfe far and neere, what a goodly deale of earth enioyeth he: and say that he
set out his bounds to the full measure of his couetous desires, what a great portion thereof shal
he hold when he is once dead, and his head laid low.

CHAP. LXIX.

¶ That the earth is in the midst of the world.

T Hat the earth is in the midst of the whole world it appeareth by manifest and vndoubted
reasons: but most evidently by the equal houres of the Equinoctial; for vnlesse it were
in the midst, the Astrolabe and instruments called *Diopha* haue proued, that nights and
daies could not possibly be found equall: and those aboue-said instruments aboue all other
confirme the same: seeing that in the Equinoctial, by one and the same line both rising and
setting of the Sun are seen; but the Sommer Sun rising, and the Winter setting, by their owne
seuerall lines: which could by no means happen, but that the earth resteth in the centre.

CHAP. LXX.

¶ Of the vnequall rising of the stars: of the Eclipse, both where
and how it commeth.

N Ow three circles there be infolded within the Zones afore named, which distinguish the
inequalities of the dayes: namely the Sommer Solstitiall Tropicke, from the highest
part of the Zodiacke in regard of vs, toward the North Clyme. And against it another
called the Winter Tropicke toward the other Southern Pole: and in like maner the Equino-
ctial, which goes in the mids of the Zodiacke circle. The cause of the rest, which we wonder
at, is in the figure of the very earth, which together with the water is by the same arguments
knowne to be like a globe: for so doubtlesse it commeth to passe, that with vs the stars about
the North pole neuer go downe; and those contrariwise about the Meridian neuer rise. And
again, these here be not seene of them, by reason that the globe of the earth swelleth vp in the
mids between. Again, Trogloditine and Egypt confining next vpon it, neuer set eye vpon the
North pole stars, neither hath Italy a sight of Canopus, named also Berenices haire. Likewise
another, which vnder the Empire of *Augustus* men surnamed *Cæsaris Thronon*: yet be they stars
there of speciall marke. And so evidently bendeth the top of the earth in the rising, that Ca-
nopus at Alexandria seemeth to the beholders eleuate aboue the earth almost one fourth part
of a signe: but if a man looke from Rhodes, the same appeareth after a sort to touch the verie
horizon: and in Pontus, where the eleuation of the North pole is highest, not seene at all: yea,
and this same pole at Rhodes is hidden, but most in Alexandria. In Arabia all hid it is at the
first watch of the night in Nouember, but at the second it sheweth. In Meroe, at Midsummer
in the euening it appeareth for a while; but some few daies before the rising of *Arcturus* seene
it is with the very dawning of the day. Sailers by their voiaiges finde out and know these stars
most of any other, by reason that some seas are opposite vnto some stars; but other lie flat and
incline forward to other: for that also those pole stars appeare suddenly, and rising out of the
sea, which lay hidden before vnder the winding compasse as it were of a ball. For the heauen
riseth not aloft in this higher pole, as some men haue giuen out; else should these stars be seen
in euery place: both those that vnto the next Sailers are supposed to be higher, the same seeme
to them as farre off drowned in the sea. And like as this North pole seemeth to be aloft vnto
those that are situate directly vnder it; so to them that be gone so far as the other dexextie
or fall of the earth, those aboue-said starres rise vp aloft there, whiles they decline downeward
which here were mounted on high. Which thing could not possibly fall out but in the figure
of

A of a ball. And hereupon it is that the inhabitants of the East perceiue not the eclipses of Sun
or Moone in the euening, no more than those that dwell West in the morning: but those that
be at noone in the South they see very oft. At what time *Alexander* the great won that famous
victorie at Arbela, the Moone by report was eclipsed at the second houre of the night; but at
the very same time in Sicily she arose. The eclipse of the Sun, which chanced before the Ca-
lends of May, when as *Vipsanius* and *Fontius* were Consuls (being not many yeares past) was
seene in Campania, betwene the 7 and 8 houres of the day: but *Corbulo*, a General Comman-
der then in Armenia, made report, that it was seene there betwene the tenth and 11 houres of
the same day; by reason that the compasse of the globe discovereth and hides some things to
some, and other to others. But if the earth were plaine and leuell, all things should appeare at
once to all men; for neither should one night be longer than another, ne yet should the day of
12 houres appeare euen and equall to any, but to those that are seated in the mids of the earth,
which now in all parts agree and accord together alike.

CHAP. LXXj.

¶ What is the reason of the day light vpon earth.

A Nd hence it commeth, that it is neither night nor day at one time in all parts of the
world, by reason that the opposition of the globe brings night, and the round compasse
or circuit thereof discovereth the day. This is knowne by many experiments. In Africk
C and Spaine there were raised by *Hanibal* high watch-towers; and in Asia for the same feare of
rouers and pyrats, the like helpe of beacons was erected; wherein it was noted oft times, that
the fires giuing warning afore-hand (which were kindled at the sixth houre of the day) were de-
scribed by them that were farthest off in Asia at the third houre of the night. *Philonides* the cur-
ror or Post of the same *Alexander* aboue named, dispatched in 9 houres of the day 1200 stadia,
euen as far as from Sicyone to Elis: and from thence againe (albeit he went downe hill all the
way) he returned oftentimes, but not before the third houre of the night. The cause was, for
that he had the Sun with him in his first setting out to Elis, and in his returne backe to Sicy-
one he went full against it, met with it, and ere he came home ouerpassed it, leauing it in the
West behind going from him. Which is the reason also, that they who by day light saile west-
ward in the shortest day of the yeare, rid more way than those who saile all night long at the
same time, for that the other do accompany the Sun.

CHAP. LXXij.

¶ The Guomonike art of the same matter: as also of the first Diall.

A Lso the instruments seruing for the houres, as Quadrants and Dials, will not serue for all
places, but in euery 300 stadia, or 500 at the farthest, the shadowes that the Sun casteth
change; and therefore the shadow of the style in the Dial, called the Gnomon, in Egypt
at noone tide in the Equinoctial day is little more in length than halfe the Gnomon. But in
E the city of Rome the shadow wanteth the ninth part of the Gnomon. In the towne Ancona it
is longer than it in 35 part. But in Venice at the same time and houre the shadow and the
Gnomon be all one.

CHAP. LXXiiij.

¶ Where and when there be no shadowes at all.

I N like manner they say, that in the towne Syene (which is aboue Alexandria 50 stadia) at
noone tide in the midst of Sommer there is no shadow at all: and for further experiment
thereof, let a pit be sunke in the ground and it will be light all ouer in euery corner. Where-
by it appeareth, that the Sun then is iust and directly ouer that place, as the very Zenith there-
of. Which also at the same time hapneth in India aboue the riuer Hypasis, as *Onesiratus* hath
set downe in writing. Yea and it is for certaine knowne, that in Berenice a city of the Troglod-
ites, and from thence 4820 stadia in the same countrey, at the towne of Prolemais (which was
built at the first vpon the very banke of the Red sea, for the pleasure of chasing and hunting
of

of Elephants) the selfe same is to be seen 45 daies before the Summer Sunsted, and as long after, and that for 90 daies space all shadowes are cast into the South. Again, in the Isle Meroe, the capitall place of the Æthiopian nation, inhabited 5000 stadia from Syene vpon the Riuer Nilus, twice in the yeare the shadowes are gon, and none at all seen; to wit, when the Sun is in the 18 degree of Taurus, and the 14 of Leo. In the country of the Oretes within India there is a mountaine named Maleus, neere which the shadowes in Summer are cast into the South, and in Winter into the North. There for 15 nights and no more is the star Charles-wain neere the pole to be seen. In the same India at Patales (a most famous and frequented port) the Sun ariseth on the right hand, and all shadowes fall to the South, Whiles Alexander made abode there, Onesicritus a captaine of his wrot, that it was obserued there, that the North star was seen the first part only of the night: also in what places of India there were no shadowes, there the North star appeared not: and that those quarters were called *Ascia*, (i. without shadow) neither keepe they any reckoning of houres there.

CHAP. LXXIV.

¶ Where twice in the yeare the shadowes go contrarie waies.

B Vt throughout all Trogliditine, *Cratosthenes* hath written, that the shadowes two times in the yeare for 45 daies fall contrarie waies.

CHAP. LXXV.

¶ Where the day is longest, and where shortest.

IT comes thus to passe, that by the variable increment of the day light, the longest day in Meroe doth comprehend 12 Equinoctial houres, and 8 parts of one houre aboue; but in Alexandria 14, in Italy 15, in Britaine 17: where in Sommer time the nights being light and short, by infallible experience shew that which reason forceth to beleue; namely, that at Midsummer time, as the Sun maketh his approach neere vnto the pole of the world, the places of the earth lying vnderneath hath day continually for six moneths, and contrariwise night, when the Sun is remote as far as Bruma. The which *Pythias* of Massiles hath written of Thule, an Island distant Northward from Britaine six daies sailing. Yea, and some affirme the same of Mona, an Island distant from Camalodunum, a towne of Britaine, about 200 miles.

CHAP. LXXVI. ¶ Of Dials and Quadrants.

THis cunning and skill of shadowes, named Gnomice, *Anaximenes* the Milesian, the disciple of *Anaximander* aboue named, inuented: and hee was the first also that shewed in Lacedemon the Horologe or Dial which they call Sciotericon.

CHAP. LXXVII. ¶ How the dayes are obserued.

THe very day it selfe men haue after diuers manners obserued. The Babylonians count for day all the time betweene two Sun-risings: the Athenians, betweene the settings. The Vmbrians from noone to noone. But all the common sort euery where, from day light vntill it be darke. The Roman Priests, and those that haue defined and set out a ciuill day, likewise the Egyptians and *Hipparchus*, from midnight to midnight. That the spaces or lights are greater or lesse betwixt Sun risings, neere the Sunsteds, than the equinoctials, it appeareth by this, that the position of the Zodiacke about the middle parts thereof is more oblique and crooked, but toward the Sunsted more streight and direct.

CHAP. LXXVIII.

¶ The reason of the varietie and difference of sundry Countries and Nations.

Hereunto we must ioine such things as are linked to celestiall causes. For doubtlesse it is, that the Æthiopians by reason of the Sunnes vicinitie are scorched and tanned with the heate thereof, like to them that be adust and burnt, hauing their beards and bush of haire curled. Also, that in the contrarie Climate of the world to it, in the frozen and icie regions

A gions the people haue white skins, haire growing long downward, and yellow; but are fierce and cruell by reason of the rigorous cold aire: howbeit the one as well as the other in this mutabilitie are dull and grosse, and the very legs do argue the temperature: for, in the Æthiopians the iuice or bloud is drawen vpward againe by the naturall heate. But among the nations Septentrionall the same is driuen to the inferior parts, by reason of moisture apt to fall downward. Here breed noisome and hurtfull wilde beasts; but there be ingendred creatures of sundry and diuers shapes, especially birds. Tall they are of bodily stature, as well in one part as the other; in the hot regions by the occasionall motion of fire: in the other by the moist nourishment. But in the midst of the earth there is an wholesome mixture from both sides: the whole Tract is fertill and fruitfull for all things, the habit of mens bodies of a mean and indifferent constitution, the colour also shewing a great temperature. The fashions and manners of the people are ciuill and gentle, their fences cleare and lightsome, their wits pregnant and capable of all things within the compasse of Nature: they also beare soueraigne rule, and sway empires and monarchies, which those vttermost nations neuer had. Yet true it is, that euen they who are out of the temperate Zones may not abide to be subiect, nor accommodate themselves to these: for such is their sauaige and brutish nature that it vrgeth them to liue solitarie by themselves.

CHAP. LXXIX.

¶ Of Earthquakes.

THe Babylonians were of this opinion, that earthquakes and gaping chinks, and all other accidents of that nature are occasioned by the power and influence of the planets, but of those three only to which they attribute lightnings: and by this means, namely as they keepe their course with the Sun, or meet with him, and especially when this concurrence is about the quadratures of the heauen. And surely if it be true which is reported of *Anaximander*, the Milesian naturall Philosopher, his prescience and foreknowledge of things was excellent, and worthy of immortalitie; who, as it is said, forewarned the Lacedemonians to looke well to their city and dwelling houses, for that there was an earthquake toward: which hapned accordingly, when not only their whole city was shaken, and fell downe, but also a great part of the mountain Taygetus, which bare out like to the poupe of a ship, broken as it were from the rest, came down too, wholly couering the foresaid ruines. There is reported another shrewd guesse of *Pherecydes*, who was *Pythagoras* his master, and the same likewise diuine and propheticall: he by drawing water out of a pit both foresaw and also foretold an earthquake there. Which if they be true, how far off I pray you may such men seeme to be from God, euen while they liue here on earth. But as for these things verily, I leaue it free for euery man to weigh and deeme of them according to their owne iudgement; and for mine owne part I suppose, that without all doubt the windes are the cause thereof. For neuer beginneth the earth to quake but when the sea is still, and the weather so calme withall, that the birds in their flying cannot honer and hang in the aire, by reason that all the spirit and winde which should beare them vp is withdrawn from them: ne yet at any time, but after the windes are laid, namely when the blast is pent and hidden within the veines and hollow caues of the earth. Neither is this shaking in the earth any other thing than is thunder in the cloud; nor the gaping chinke thereof ought else but like the clift whereout the lightning breaketh, when the spirit inclosed within strugleth and stirreth to go forth at libertie.

CHAP. LXXX.

¶ Of the gaping chinks of the earth.

F A Frer many and sundry sorts the earth therefore is shaken, and thereupon ensue wondrous effects: in one place the walls of cities are laid along: in another they be swallowed vp in a deepe and wide chawne: here are cast vp mighty heaps of earth; there are let out Riuers of water, yea and sometimes fire doth breathe forth, and hot springs issue abroad: in another place the course and channell of riuers is turned clean away and forced backward. There goeth before and commeth with it a terrible noise: one while a rumbling more like the loowing

and bellowing of beasts: otherwhiles it resembles a mans voice, or else the clattering and rustling of armor and weapons, beating one vpon another according to the qualitie of the matter that catcheth and receiueth the noise, or the fashion either of the hollow cranes within, or the cranny by which it passeth, whiles in a narrow way it taketh on with a more slender and whistling noise: and the same keepeth an hoarse din in winding and crooked caues, rebounding againe in hard passages, roaring in moist places, wauing and floting in standing waters, boiling and chafing against solid things. And therefore a noise is often heard without any earthquake, and neuer at any time shaketh it simply after one and the same manner, but trembles and waggeth to and fro. As for the gaping chink, sometimes it remaineth wide open, and sheweth what it hath swallowed vp; otherwhiles it closeth vp the mouth, and hideth all, and the earth is knit together so againe, as there remaine no marks and tokens to be seene: notwithstanding many times it hath deuoured cities, and drawne into it a whole tract of ground and fields. Sea coasts and maritime regions most of all other feeble earthquakes. Neither are the hilly countries without this calamitie: for I my selfe haue known for certain, that the Alps and Apenine haue often trembled. In the Autumne also and Spring there happen more earthquakes than at other times, like as lightnings. And hereof it is that France and Egypt least of all other are shaken: for that in Egypt the continuall Sommer, and in France the hard Winter, is against it. In like manner, earthquakes are more rife in the night than in the day time: but the greatest vse to be in the morning and euening. Toward day light there be many; and if by day, it is vsually about noon. They fortune also to be when the Sun and Moone are eclipsed, because then all tempests are asleepe and laid to rest. But especially, when after much raine there followes a great time of heate; or after heate store of raine.

CHAP. LXXXJ.

¶ *Signes of Earthquake comming.*

Sailers also haue a certaine foreknowledge thereof, and guesse not doubtfully at it, namely when the waues swel suddenly without any gale of wind, or when in the ship they are shocked with billowes shaking vnder them: then are the things seen to quake which stand in the ship, as well as those in houses, and with a rustling noise giue warning before-hand. The foules likewise of the aire sit not quietly without feare. In the sky also there is signe thereof; for there goeth before an earthquake, either in day time, or soon after the Sun is gon downe, a thin streak or line as it were of a cloud, lying out in a great length. Moreover, the water in wells and pits is more thicke and troubled than ordinary, casting out a stinking sent.

CHAP. LXXXIj.

¶ *Remedies or helps against Earthquakes toward.*

But a remedie there is for the same, such as vaults and holes in many places do yeeld: for they vent and breathe out the wind that was conceiued there before: a thing noted in certain townes, which by reason they stand hollow, and haue many sinks and vaults digged to conuey away their filth, are lesse shaken: yea, and in the same townes, those parts which be pendant be the safer: as is well seen in Naples, where that quarter thereof which is folliid and not hollow is subiect to such casualties. And in houses the arches are most safe, the angles also of walls, yea, and those posts which in shaking will jog to and fro euery way. Moreover, walls made of brick or earth take lesse harme when they be shaken in an earthquake. And great difference there is in the very kinde and manner of earthquakes, for the motion is diuers: the safest is, when houses as they rocke keep a trembling and warbling noise: also when the earth seemeth to swell vp in rising, and again to settie down and sink with an alternatiue motion. Harmlesse it is also when houses run on end together by a contrary stroke, and butt or jure one against another; for the one mouing withstandeth the other. The bending downward in maner of wauing, and a certain rolling like to surging billowes is it that is so dangerous, and doth all the mischief: or when the whole motion beareth and forceth it selfe to one side. These quakings or tremblings of the earth giue ouer when the winde is once vented out: but if they continue still, then they cease not vntill forty daies end, yea and many times it is longer ere they stay, for some of them haue lasted the space of a yeare or two.

CHAP.

CHAP. LXXXIII.

¶ *Monstrous Earthquakes seene neuer but once.*

Here hapned once (which I found in the books of the Tuscane learning) within the territorie of Modena, whiles *L. Martius* and *S. Iulius* were Consuls, a great strange wonder of the earth; for two hills encountered together, charging as it were, and with violence assaulting one another, yea and retrying againe with a most mighty noise. It fell out in the day time, and between them there issued flaming fire and smoke mounting vp into the sky; while a great number of Roman Gentlemen (from the highway *Æmylia*) and a multitude of seruants and passengers stood and beheld it. With this conflict and running of them together all the villages vpon them were dashed and broken to pieces: very much cattell that was within died therewith. And this hapned the yeare before the war of our Associates: which I doubt whether it were not more pernicious to the whole land of Italy, than the ciuill wars. It was no lesse monstrous a wonder that was knowne also in our age, in the very last yeare of *Nero* the Emperour (as we haue shewed in his acts) when medows and oliue rowes (notwithstanding the great publique port way lay betweene) passed ouerthwart one into anothers place, in the *Marrucine* territorie, within the lands of *Vestius Marcellus* a gentleman of Rome, Procurator vnder *Nero* in his affaires.

CHAP. LXXXIv.

¶ *Wonders of Earthquakes.*

Here happen together with earthquakes deluges also and inundations of the sea, being infused and entering into the earth with the same aire and wind, or else receiued into the hollow receptacle as it setleth down. The greatest earthquake in mans memory was that which chanced during the empire of *Tiberius Caesar*, when twelue cities of Asia were laid leuell in one night. But the earthquakes came thickest in the Punick war, when in one yeare were reported to be in Rome 57. In which yeare verily, when the Carthaginians and Romans fought a battell at *Thrasymenus* lake, neither of both armies tooke notice of a great earthquake. Neither is this a simple euill thing, nor the danger consisteth only in the very earthquake, and no more: but that which it portendeth is as bad or worse. Neuer abode the city of Rome any earthquake, but it gaue warning thereof before hand of some strange accident and vnhappie euent following.

CHAP. LXXXv.

¶ *In what places the seas haue gone backe.*

The same cause is to be rendred of some new hill or piece of ground not seen before; when as the said winde within the earth, able to huffe vp the ground, was not powerful enough to breake forth and make issue. For, firme land groweth not only by that which Riuer bring in (as the Isles *Echinades*, which were heaped and raised vp by the riuer *Achelous*; and by *Nilus* the greater part of Egypt, into which, if wee beleue *Homer*, from the Island *Pharus* there was a cut by sea of a day and a nights sailing) but also by the retiring and going backe of the sea, as the same poet hath written of the *Circeia*. The like (by report) hapned both in the bay of *Ambracia* for ten miles space, and also in that of the Athenians, for five miles, nere *Piræum*: also at *Ephesus*, where sometime the sea beate vpon the temple of *Diana*. And verily, if we giue care to *Herodotus*, it was all a sea from about Memphis to the *Ethyopian* hills: and likewise from the plaines of Arabia. It was sea also about *Ilium*, and the flat of *Teuthrania*; and all that leuell whereas the riuer *Mæander* now runneth by goodly medowes.

CHAP. LXXXvi.

¶ *The reason of Islands that newly appeare out of the sea.*

Here be lands also that put forth after another manner, and all at once shew on a sudden in some sea; as if Nature cried quittance with her selfe, and made euen, paying one for another, namely by giuing againe that in one place, which those chawnes and gaping gulfes tooke away in another.

¶ *What Islands haue sprung vp, and when.*

Those famous Islands long since, to wit, Delos and Rhodes, are recorded to haue growne out of the sea: and afterwards others that were lesse, namely Anaphe beyond Melos, and Nea, betweene Lemnus and Hellespont. Alone also, betweene Lebedus and Teos. Thera likewise, and Therasia, among the Cyclades, which shewed in the fourth yere of the 135 Olympias. Moreover, among the same Isles 130 yeres after, Hiera, which is the same that Automate. And two furlongs from it, after 110 yeres, Thia, euen in our time, vpon the 8 day before the Ides of Iuly, when *M. Iunius Syllanus* and *L. Balbus* were Consuls.

¶ *What lands the Seas haue broken in betweene.*

Even within our kenning, neere to Italy, between the isles *Eoliæ*. In like maner neer Creta there was one shewed it selfe with hot fountaines out of the sea, for a mile and halfe; and another in the 3 yere of the 143 Olympias, within the Tuscan gulf, and this burned with a violent winde. Recorded it is also, that when a great multitude of fishes floted ebbe about it, those persons died presently that did feed thereof. So they say that in the Campaine gulfe the *Pithecusæ* Islands appeared. And soon after, the hill *Epopos* in them (at what time as suddenly there burst forth a flaming fire out of it) was laid leuell with the plain champion. Within the same also there was a town swallowed vp by the sea: and in one earthquake there appeared a standing poole; but in another, by the fall and tumbling downe of certain hills, grew the Island *Prochyta*. For after this maner also Nature hath made Islands; thus she dis-ioyned Sicily from Italy, Cyprus from Syria, Eubœa from Bœotia, Atalante and Macris from Eubœa, Besbycus from Bithynia, Leucostia from the promontorie and cape of the Syrenes.

¶ *What Islands came to ioyne vnto the Main.*

Again, shee hath taken Islands from the sea, and ioyned them to the firme land; namely, Antissa to Lesbos, Zephyria to Halicarnassus, Aethusa to Myndus, Dromiscos and Pern to Miletus, and Narthecusa to the promontorie Parthenius. Hybanda, sometime an Isle of Ionia, is now distant from the sea 200 stadia. As for Syrie, Ephesus hath it now in the midland parts far from the sea. So Magnesia neighbouring to it, hath Derasitas and Sophonia. As for Epidaurus and Oricum, they are no more Islands at this day.

¶ *What lands haue been turned wholly into sea.*

Nature hath altogether taken away certaine lands: in the first place, whereas now the sea Atlanticum is, was sometime the continent for a mighty space of ground, as *Plato* saith. Likewise in our Mediterranean sea, all men may see at this day how much hath been drowned vp, to wit, Acarnania by the inward gulfe of Ambracia, Achaia within that of Corinth, Europ and Asia within Propontis and Pontus.ouer and besides, the sea hath broken through Leucas, Antirrhium, Hellespont, and the two Bosphori.

¶ *What lands haue swallowed vp themselves.*

And now to passe ouer armes of the sea and lakes; the very earth hath deuoured and buried her selfe: to wit, that most high hill *Cybotus*, with the towne *Curites*; *Sipylus* in Magnesia: and in the same place before time the most noble city called *Tantalus*; the territories of *Galanis* and *Gamale* in Phœnice, together with the very cities. *Phogium* also, a passing high hill in Ethiopia, as if the very stronds and continent were not to be trusted, but they also must worke hurt and mischief.

¶ *What Cities haue been drowned with the sea.*

The sea Pontus hath ouerwhelmed *Pyrria* and *Antyssa* about *Mæotis*, *Elice* and *Bura* in the gulfe of Corinth; whereof the marks and tokens are to be seene in the Deep. Out of the Island *Cea* more than 30 miles of ground was lost suddenly at once, with many men. In Sicily also the sea came in and bare away halfe the city *Thindaris*, and all that Italy nurseth betweene it and Sicily. The like it did in Bœotia and Eleusina.

¶ *Of the strange wonders of the land.*

For let vs speake no more of Earthquakes, and whatsoeuer else of that kind, as of graues and sepulchres of cities buried, and extant to be seene; but discourse we rather of the wonders, than the mischiefs wrought by Nature in the earth. And surely the story of cœlestiall things was not more hard to be declared: the wealth is such of mettals and mines, in such variety, so rich, so fruitfull, rising still one vnder another for so many ages, notwithstanding daily there is so much wasted and consumed throughout the world, with fires, ruines, shipwrecks, wars, and fraudulent practises: yea and so much spent in ryot and superfluous vanities, that it is infinite: yet see how many sorts of gemmes there be still, so painted and set out with colors? in precious stones what varieties of sundry colours, and how bespotted are they: and amongst them behold the brightnesse and white hue of some, excluding all else but onely light! The vertue and power of medicinable fountaines: the wonderfull burning so many hundred yeres together of fire issuing forth in so many places: the deadly dampes and exhalations in some places, either sent out of pits when they are sunke, or else from the very natieue seat and position of the ground; present death in one place to the birds and foules of the aire only (as at *Socrate*, in a quarter neere the city:) in other, to all other liuing creatures saue only man: yea and sometimes to men also, as in the territories of *Sinuessa* and *Puteoli*. Which damp holes breaching out a deadly aire some call *Charonæa Scrobes*, i. *Charons* ditches. Likewise in the *Hirpines* land, that of *Amisanctus*, a caue neere vnto the temple of *Nephtes*, wherinto as many as enter dy presently. After the like manner at *Hierapolis* in Asia there is another such, hurting all that come to it, except the priest of *Cybele*, the great mother of the gods. In other places there be also caues and holes of a propheticall power; by the exhalation of which men are intoxicate and as it were drunken, and so foretell things to come, as at *Delphi* that most renowned Oracle. In all which things what other reason can any mortall man make, than the diuine power of Nature, diffused and spread through all, which breaketh forth at times in sundry sorts.

¶ *Of certaine Lands that alwaies quake.*

Some parts of the earth there be that shake and tremble vnder mens feet as they go: namely in the territorie of the *Gabians* not far from Rome, there be almost two hundred acres of ground which tremble as horsemen ride ouer them. And the like is in the territory of *Reate*.

¶ *Of Islands euer floting and swimming.*

Certaine Isles are alwaies wauiing and neuer stand still, as in the countrey about *Cæcubum*, *Reate* about named, *Mutina*, and *Statonia*. Also in the lake *Vadimonis*, and neer the waters *Cutylia*, there is a shadowie darke groue which is neuer seene in one place a day and night together. Moreover in *Lydia*, the Isles *Calanuca* are not only driuen to & fro by winds, but also many be shoued and thrust with long poles which way a man will: a thing that faued

many a mans life in the war against *Mithridates*. There be other little ones also in the River *Nymphæus*, called *Saltuares* or *Dancers*, because in any consort of Musicians singing they stir and moue at the stroke of the feet, keeping time and measure. In the great lake of *Italy*, *Tarquinienfis*, two Islands carry about with them groues and woods: one while they are in fashion three square, another while round, when they close one to the other by the drift of winds, but neuer fouresquare.

CHAP. XCVI.

¶ In what lands it neuer raineth. Also many strange wonders and miracles of the earth, and other Elements heaped together.

Paphos hath in it a famous temple of *Venice*, vpon a certain floure and altar whereof it neuer raineth. Likewise in *Nea* a towne of *Troas* a man shall neuer see it raine about the Image of *Minerva*. In the same also the beasts killed in sacrifice, if they be left there neuer putrifie. Neere to *Harpasa* a towne in *Asia* stands a rocke of stone of a strange and wonderful nature, lay one finger to it and it will stir, but thrust at it with your whole body, it moueth not at all. Within the demy Island of the *Tauri*, and city *Parasinum*, there is a kinde of earth that healeth all wounds: but about *Affios* in *Troas* there growes a stone, wherewith bodies are consumed, and therefore is called *Sarcophagus*. Two hills there be neere the river *Indus*: the nature of the one is to hold fast all manner of iron, and of the other not to abide it: wherefore if a mans shooe sole be clouted with hob nailes, in the one of them a man cannot plucke away his foot, and in the other he can take no footing at all. Noted it is, that in *Locri* and *Crotone* was neuer pestilence knowne, nor any danger by earthquake. And in *Lycia* euer after an earthquake it hath been faire for forty daies. In the territorie of *Arda* if corne be sowed it neuer comes vp. At the altars *Murtiæ* in the *Veientian* field, likewise in *Tusculanum* and the wood *Cyminia*, there be certaine places, wherein whatsoever is pitched into the ground, can neuer be plucked vp againe. In the *Crustumine* countrey all the hay there growing is hurtfull in the same place: but being once without, it is good and wholefome.

CHAP. XCVII.

¶ What is the reason of the reciprocall ebbe and flow of the seas; and where it is that they keepe no order, and are without reason.

OF the nature of waters much hath bin said: but the sea tide that it should flow and ebbe againe is most maruellous of all other: the maner thereof verily is diuers, but the cause is in the Sun and Moon. Between two risings of the Moone they flow twice, and twice go backe, and alwaies in the space of 24 houres. And first as he riseth aloft together with the world the tides swell, and anon again, as it goeth from the height of the Meridian line, and enclineth Westward, they flake: again, as she moueth from the West vnder our horizon, and approacheth to the point contrarie to the Meridian, they flow, and then they are receiued backe into the sea vntill she rise again: and neuer keepeth the tyde the same houre that it did the day before; for it waiteth and attendeth vpon the planet, which greedily draweth with it the seas, and euer riseth to day in some other place than it did yesterday. Howbeit the tides keepe iust the same time between, and hold alwaies six houres apiece: I meane not of every day and night, or place indifferently, but only the equinoctial. For in regard of houres the tides of the sea are vnequall, forasmuch as by day and night the tydes are more or lesse one time than another: in the equinoctial only they are euen and alike in all places. A very great argument this is, full of light, to conuince that grosse and blockish conceit of them who are of opinion, that the planets being vnder the earth lose their power, and that their vertue beginneth when they are aboue only: for they shew their effects as well vnder as aboue the earth, as well as the earth, which worketh in all parts. And plaine it is, that the Moone performeth her operations as well vnder the earth, as when we see her visibly aloft: neither is her course any other beneath, than aboue our horizon. But yet the difference and alteration of the Moone is manifold, and first every seven daies: for whiles she is new the tides be but small vntill the first quarter:

for

A for as she groweth bigger, they flow more, but in the full they swell and boile most of all. From that time they begin again to be more milde; and in the first daies of the wain to the seuenth, the tides are equall: and againe when she is diuided on the other side, and but halfe Moon, they increase greater. And in the Coniunction or the change, they are equal to the tides of the full. And euidently it appeareth, that when she is Northerly, and retired higher & farther from the earth, the tides are more gentle, than when she is gone Southerly; for then she worketh neerer hand, and putteth forth her full power. Euery eight yere also, & after the hundreth revolution of the Moone, the seas returne to the beginning of their motions, and to the like encrease and growth: by reason that she augmenteth all things by the yerely course of the Sun: forasmuch as in the two equinoctials they euer swell most, yet more in that of the Autumne, than the Spring: but nothing to speak of in Mid-winter, & lesse at Mid-summer. And yet these things fall not out iust in these very points and instants of the times which I haue named, but some few daies after: like as neither in the full nor in the change, but afterward: ne yet presently so soon as the heauen either sheweth vs the Moon in her rising, or hideth her from vs at her setting, or as shee declineth from us in the middle climat, but later almost by two equinoctial hours. Forasmuch as the effect of all influences and operations in the heauen reach not so soon vnto the earth, as the eyesight pierceth vp to the heauen: as it appeareth by lightnings, thunders, & thunderbolts. Moreouer, all tides in the main Ocean, ouerspread, couer, and ouerflow much more within the land, than in other seas besides: either because the whole and vniuersall element is more courageous than in a part: or for that the open greatnesse and largenesse thereof, feeleth more effectually the power of the Planet, working forcibly as it doth far and neere at liberty, than when the same is pent and restrained within those streights. Which is the cause that neither lakes nor little riuers ebbe and flow in like manner. *Pythias* of *Massiles*, writeth, That about *Brittain* the tide floweth in height 80 cubits. But the more inward and *Mediterranean* narrow seas are shut vp within the lands, as in an haue. Howbeit in some places a more spacious liberty there is that yeeldeth to the power and command of the Moon; for we haue many examples and experiments of them that in a calm sea without wind and saile, by a strange water onely, haue tided from *Italy* to *Vtica* in three daies. But these tides and quick motions of the sea are found to be about the shores, more than in the deep maine sea. For euen so in our bodies the extreme and vtmost parts haue a greater feeling of the beating of arteries, that is to say, the vitall spirits.

D Yet notwithstanding in many firths and armes of the sea, by reason of the vnlike risings of the planets in euery coast, the tides are diuers, and disagreeing in time, but not in reason and cause, as namely in the *Syrtis*. And yet some there be that haue a peculiar nature by themselves, as the *Firth Taurominitanum*, which ebbeth and floweth oftner than twice: and that either in *Eubœa*, called likewise *Euripus*, which hath seven tides to and fro in a day and a night. And the same tide three daies in a moneth standeth still, namely in the 7, 8, and 9 daies of the moons age. At *Gades*, the fountain next vnto the chappell of *Hercules*, is inclosed about like a well, the which at sometimes riseth and falleth as the Ocean doth: at others againe it doth both, at contrary seasons. In the same place there is another spring that keepeth order and time with the motions of the Ocean. On the banke of *Betis* there is a towne, the wells whereof as the tide floweth, do ebbe; and as it ebbeth, do flow: in the mid times betweene, they stirre not. Of the same qualitie there is one pit in the towne *Hispalis*; all the rest be as others are. And the sea *Pontus* euermore floweth and runneth out into *Propontis*, but the sea neuer retireth backe againe within *Pontus*.

CHAP. XCVIII.

¶ *Marmels of the Sea.*

ALl seas are purged and scoured in the full Moone; and some besides at certain times. About *Messala* and *Nylæ*, there is voided vpon the shore certaine dregges and filthinesse like to beasts dung: whereupon arose the fable, That the Sunnes oxen were there kept in stall. Hereunto addeth *Aristotle* (for I would not omit willingly any thing that I know) that no liuing creature dieth but in the reflux and ebbe of the sea. This is obserued much in the Ocean of *France*, but found onely in man by experience, true.

CHAP.

By which it is truly guessed and collected, that not in vaine the planet of the Moone is supposed to be a Spirit: for this is it that satisfieth the earth to her content: fhee it is that in her approch and comming toward, filleth bodies full; and in her retire and going away, emptieth them again. And hereupon it is, that with her growth all shell-fish wax & encrease: and those creatures which haue no bloud, them most of all do feele her spirit. Also, the bloud in men doth increase or diminish with her light more or lesse: yea the leaues of trees and the grasse for fodder (as shall be said in conuenient place) do feele the influence of her, which euer more the same pierceth, and entreth effectually into all things.

CHAP. C.

¶ *Of the power of the Sun, and why the Sea is salt.*

Thus by the feruent heate of the Sun all moisture is dried vp: for wee haue been taught, that this Planet is Masculine, trying and sucking vp the humidity of all things. Thus the broad and spacious sea hath the taste of salt foddren into it: or else it is, because when the sweet and thin substance thereof is sucked out from it, which the fire power of the Sun most easily draweth vp, all the tarter and more grosse parts thereof remaine behinde: and hereupon it is, that the deep water toward the bottom is sweeter and lesse brackish than that aboue in the top. And surely, this is a better and truer reason of that vnpleasant smacke and taste that it hath, than that the sea should be a sweat issuing out of the earth continually: or, because ouer-much of the dry terrene element is mingled in it without any vapour: or else because the nature of the earth infecteth the waters, as it were, with some strong medicine. We finde among rare examples and experiments, that there happened a prodigious token to *Demis* tyrant of Sicily, when he was expelled and deposed from that mightie state of his, and this it was; the sea water within one day in the haueu grew to be fresh and sweet.

CHAP. CI.

¶ *In like manner of the Moones Nature*

On the contrary, they say that the Moone is a planet Foeminine, tender & nightly, diffolueeth humors, draweth the same, but carieth them not away. And this appeareth evidently by this prooffe, that the carcases of wilde beafts slaine, she putrifieth by her influence, if she shine vpon them. When men also are found asleepe, the dull nummednesse thereby gathered, she draweth vp into the head: she thaweth yce, and with a moistening breath proceeding from her, enlargeth and openeth all things. Thus you see how Natures turn is serued and supplied, and is alwaies sufficient; whiles some stars thicken and knit the elements, others againe resolue the same. But as the Sun is fed by the salt seas, so the Moone is nourished by the fresh riuer waters.

CHAP. CII.

¶ *Where the Sea is deepest.*

Fabianus saith, that the sea where is deepest, exceedeth not fifteen furlongs. Others againe do report, that in Pontus the sea is of an vnmeasurable depth, ouer against the Nation of the Coraxians, the place they call *Bathei Ponti*, whereof the bottome could neuer bee founded.

CHAP. CIII.

¶ *The wonders of Waters, Fountaines and Rivers.*

Of all wonders this passeth, that certain fresh waters hard by the sea, issue & spring forth as out of pipes: for the nature of the waters also ceaseth not from strange and miraculous properties. Fresh waters run aloft the sea, as being no doubt the lighter: and therefore

Afore the sea water (which naturally is heauier) vpholdeth and beareth vp whatsoeuer is brought in. Yea and amongst fresh waters, some there be that floe and glide ouer others. As for example, in the lake Fucinus, the riuer that runneth into it: in Larius, Addua; in Verbanus, Ticinus; in Benacus, Mincius; in Scuinus, Ollius; in Lemanus lake, the riuer Rhodanus. As for this riuer beyond the Alpes, and the former in Italy, for many a mile as they passe, carry forth their owne waters from thence where they abode as strangers, and none other; and the same no larger than they brought in with them. This is reported likewise of Orontes, a riuer in Syria, and of many others. Some riuers again there be, which vpon an hatred to the sea, run euen vnder the bottom thereof, as Arethusa, a fountaine in Syracusa: wherein this is obserued, that whatsoeuer is cast into it, commeth vp againe at the riuer Alpheus, which running through Olimpia, falleth into the sea shore of Peloponnesus. There go vnder the ground, and shew about the ground againe, Lycus in Asia, Erasinus in Argolica, Tygris in Mesopotamia. And at Athens what things soeuer are drowned in the fountain of Esculapius, be cast vp againe in Phalericus. Also in the Attinate plaines, the riuer that is buried vnder the earth, twentie miles off appeareth againe. So doth Timavus in the territory of Aquileia, in Asphaltes (a lake in Iury which ingenders *Bitumen*) nothing will sinke nor can be drowned, no more than in Arcthusa in the greater Armenia: and the same verily, notwithstanding it be full of Nitre, breedeth and feedeth fish. In the Salentines country, neere the towne Manduria, there is a lake brim full: lade out of it as much water as you will, it decreaseth not; ne yet augmenteth, poure in neuer so much to it. In a riuer of the Ciconians, and in the lake Velinus in the Picene territory, if wood be throwne in, it is couered ouer with a stony barke. Also in Surius, a riuer of Colchis, the like is to be seen: in so much, as ye shall haue very often the bark that ouergrowes it, as hard as any stone. Likewise in the riuer Silarus beyond Surrentum, not twigs onely that are dipped therein, but leaues also grow to be stones; and yet the water thereof otherwise is good and wholesome to be drunk. In the very passage and issue of Reatine meere, there growes a rocke of stone bigger and bigger by the dashing of the water. Moreover in the red sea there be oliue trees and other shrubs, that grow vp green. There be also very many springs, which haue a wonderfull nature, for their boiling heat: yea, and that vpon the very mountains of the Alpes, and in the sea between Italy and Anaria: as in the Firth Baianus, and the riuer Liris, and many others. For in diuers and sundry places ye may draw fresh water out of the sea, namely about the islands Chelidonæ and Aradus: yea and in the Ocean about Gades. In the hot waters of the Padouans there grow greene herbes: in those of the Pisanes there breed frogs: and at Vetulonij in Hetruria, not far from the sea, fishes also are breed. In the territory Casinas there is a riuer called Scatebra, which is cold, and in Summer time more abounding and fuller of water than in winter: in it, as also in Symphalis of Arcadia, there breed & come forth of it little water-mice, or small Limpins. In Dodone, the fountain of *Iupiter* being exceeding chill and cold, so as it queneth and putteth out light torches dipped therein, yet if you hold the same neere vnto it when they are extinct and put out, it setteth them on fire againe. The same spring at noon-tide euermore giueth ouer to boile, and wants water, for which cause they call it *Anapaomenos*: anon it begins to rise vntill it be midnight, and then it hath great abundance: and from that time againe it faints by little and little. In Illyricum there is a cold spring, ouer which, if ye spread any clothes, they catch a fire and burne. The fountaine of *Iupiter Hammon* in the day time is cold, all night it is seething hot. In the Troglodites country there is a fountaine of the Sunne, called the sweet Spring, about noon it is exceeding cold, anon by little and little it growes to be warm, but at midnight it passeth and is offensive for heate and bitterness. The head of the Po, at noon in Summer giueth ouer, as it were, and intermits to boile, and is then euer drie. In the Island Tenedus there is a spring, which after the Sommer Sunsteed euermore from the third houre of the night vnto the sixth, doth ouerflow. And in the isle Delos, the fountain Inopus, falleth and rises after the same sort that Nilus doth, and together with it. Ouere against the riuer Timavus, there is a little Island within the sea, hauing hot wells, which ebbe and flow as the tide of the sea doth, and iust therewith. In the territory of the Pitinates beyond Apenninus, the riuer Nouanus at euery mid-summertime swelles and runnes ouer the bankes, but in mid-winter is cleane dry. In the Faliscane countrie, the water of the riuer Clitumnus makes the oxen and kine white that drinke of it. And in Beotia, the riuer Melas maketh sheepe blacke: Cephysus running out of the same lake, causeth them to be white: and Penius again giues them a black colour: but Xanthus neere

vnto Ilium, coloureth them reddish; and hereupon the riuer tooke that name. In the land of G Pontus there is a riuer that watereth the plaines of Attace, vpon which those mares that feed, giue blacke milke for the food and sustenance of that nation. In the Reatine territorie there is a fontaine called Nemina: which, according to the springing and issuing forth out of this or that place, signifyeth the change in the price of come and victuals. In the haue of Brindis there is a Well, that yeeldeth vnto failers and sea-fering-men, water, which will neuer corrupt. The water of Linceitis, called Acidula [*i. Soure*] maketh men drunken no lesse than wine. Semblably, in Paphlagonia, and in the territory of Cales. Also in the Isle Andros there is a fontaine neere the temple of Father *Bacchus*, which vpon the Nones of Ianuarie, alwaies runneth with water that tasteth like wine, as *Mulianus* verily beleueth, who was a man that had bene thrice Confull: The name of the spring is Dios Tecnosia. Neere vnto Nonacris in Arcadia, there is the riuer Styx, differing from the other Styx neither in smell nor colour: drinke of it once, and it is present death. Also in Berofus (an hill of the Tauri) there be three fountaines, the water whereof whosoeuer drinketh, is sure to die of it, remediless, and yet without paine. In the Countrey of Spaine called Carrinenfis, two Springs there bee that runne neere together, the one rejecteth, the other swalloweth vp all things. In the same countrey there is another water, which sheweth all fishes within it a golden colour, but if they be once out of that water, they be like to other fishes. In the Canenian territory, neere to the lake Larius, there is a large and broad Well, which euery houre continually, swelleth and falleth downe againe. In the Island Sydonia before Lesbos, an hot fontaine there is that runneth onely in the Spring. The lake Sinnaus in Asia, is infected with the wormewood growing about it, and there of it tasteth. At Colophon in the vault or caue of *Apollo Clarius*, there is a gutter or trench standing full of water: they that drinke of it, shall prophesie and foretell strange things like Oracles, but they liue the shorter time for it. Riuer running backward, euen our age hath seen, in the later yeres of Prince *Nero*, as we haue related in the acts of his life. Now, that all Springs are colder in Summer than Winter, who knoweth not? as also these wonderous workes of Nature, That brasse and lead in the masse or lumpes sinke downe and are drowned, but if they be driuen out into thin plates, they flote and swim aloft: and let the weight be all one, yet some things settle to the bottome, others againe glide aboue. Moreouer, that heauie burdens and lodes be stirred and remoued with more ease in water. Likewise, that the stone Thyreus, be it neuer so big, doth swim whole and intire: breake it once into pieces, and it sinketh. As also, that bodies newly dead, fall downe to the bottome of the water, but if they be swollen once, they rise vp againe. Out and besides, that empty vessels are not so easily drawne forth of the water, as those that be full: that raine water for salt pits is better and more profitable than all other: and that salt cannot be made, vnlesse fresh water be mingled withall: that sea-water is longer before it congeale, but sooner made hot and set a seething. That in Winter the sea is hotter, and in Autumne more brackish and salt. And that all seas are made calme and still with oile: and therefore the Diuers vnder the water doe spirt and sprinkle it abroad with their mouthes because it dulceth and allaieth the vnpleasant nature thereof, and carrieth a light with it. That no snowes fall where the sea is deep. And, whereas all water runneth downward by nature, yet Springs leape vp; euen at the very foot of *Aetna*, which burneth of a light fire so farre forth, as that for fiftie, yea, and an hundred miles, the waulming round bals and flakes of fire cast out sand and ashes.

CHAP. CIIII.

¶ The manuailes of fire and water ioiintly together, and of *Maltha*.

Now let vs relate some strange wonders of fire also, which is the fourth element of Nature. But first, out of waters. In a citie of Comagene, named Samofatis, there is a pond, yeelding forth a kinde of slimie mud (called *Maltha*) which will burne cleare. When it meeteth with any thing solide and hard, it sticketh to it like glew: also, if it be touched, it followeth them that flee from it. By this meanes the townesmen defended their walls, when *Lucullus* gaue the assault, and his souldiers fried and burned in their owne armours. Cast water vpon it, and yet it will burne. Experience hath taught, That earth onely will quench it.

CHAP.

CHAP. CV. ¶ Of *Naphtha*.

Of the like nature is *Naphtha*: for so is it called about Babylonia, and in the Aufacenes countrey in Parthia, and it runneth in manner of liquid Bitumen. Great affinitie there is betweene the fire and it; for fire is ready to leap vnto it immediatly, if it be any thing neere it. Thus (they say) *Media* burnt her husbands concubine, by reason that her guirland anointed therewith, was caught by the fire, after she approached neere to the altars, with purpose to sacrifice.

CHAP. CVI. ¶ Of places continually burning.

Vt amongst the wonderfull mountaines, the hill *Aetna* burneth alwaies in the nights: and for so long continuance of time yeeldeth sufficient matter to maintaine those fires: in winter it is full of snow, and couereth the ashes cast vp, with frosts. Neither in it alone doth Nature tyrannize and shew her cruelty, threatning as she doth a general consuming of the whole earth by fire. For in Phoselis the hill *Chimæra* likewise burneth, and that with a continuall fire night and day. *Ctesias* of Gnidos writeth, that the fire therof is inflamed and fed a burning with water, but quenched with earth. In the same Lycia the mountaines *Hephæstij*, being once touched and kindled with a flaming torch, do so burne out, that the very stones of the riuers, yea, and the sand in waters, are on fire withall, and the same fire is maintained with raine. They report also, that if a man make a furrow with a staffe that is set on fire by them, there follow gutters as it were of fire. In the Baetrians countrey, the top of the hill *Cophantus* burneth euery night. Amongst the Medians also, and the Cæstian nation, the same mountaines burneth: but principally in the very confines of Persis. At Susis verily, in a place called the white tower, out of fiftene chimnies or tunnels the fire issueth, and the greatest of them, euen in the day time carrieth fire. There is a plaine about Babylonia, in manner of a fish poole, which for the quantity of an acre of ground burneth likewise. In like sort neere the mountaine *Hesperius* in *Aethyopia*, the fields in the night time do glitter and shine like stars. The like is to be seene in the territorie of the Megapolitanes, although the field there within-forth be pleasant, and not burning the boughes and leaues of the thicke groue aboue it. And neere vnto a warme Spring, the hollow burning furnace called *Crater Nymphae* alwaies portendeth some fearefull misfortunes to the Apolloniates, the neighbours thereby, as *Theopompus* hath reported. It increaseth with showers of raine, and casteth out Bitumen to be compared with that fontaine or water of Styx that is not to be tasted, otherwise weaker than all Bitumen besides. But who would maruell at these things? in the mids of the sea, *Hiera* one of the *Ætolian* Islands neere to Italy burned together with the sea for certaine daies together, during the time of the allies war, vntill a solemne embassage of the Senat made expiation therefore. But that which burneth with the greatest fire of all other, is a certaine hill of the *Aethyopians* Thoeet Ochema, and sendeth out most parching flames in the hottest Sun-shine daies. Lo in how many places with sundry fires Nature burneth the earth.

CHAP. CVII.

¶ Wonders of fires by themselves.

Moreouer, since the Nature of this onely element of fire is to be so fruitfull, to breed it selfe, & to grow infinitely of the least sparks, what may be thought will be the end of so many funerall fires of the earth? what a nature is that which feedeth the most greedy voracitie in the whole world without losse of it selfe? Put thereto the infinit number of stars, the mighty great Sun; moreover, the fires in mens bodies, & those that are inbred in some stones, the attrition also of certain woods one against another; yea, and those within clouds, the verie original of lightnings. Surely, it exceedeth all miracles, that any one day should passe, & not all the world be set on a light burning fire, since that the hollow fiery glasses also set opposit against the Sun beams, sooner set things a burning than any other fire. What should I speake of innu-
merable

merable others, which beindeed little, but yet naturally issuing out in great abundance? In the Promontorie Nymphæum there commeth forth a flaming fire out of a rock, which is set a burning with rain. The like is to be scene also at the waters called Scantiæ. But this verily is but feeble when it passeth and remoueth, neither indureth it long in any other matter. An ash there is growing ouer his fiery fountain, and covering it, which notwithstanding is alwaies green. In the territorie of Mutina there riseth vp fire also, vpon certaine set holy daies vnto *Vulcan*. It is found written, That if a cole of fire fall down vpon the arable fields vnder Aricia, the very soile presently is on fire. In the Sabines territorie, as also in the Sidicines, stones if they be anointed or greased, will be set on a light fire. In a towne of the Salantines called Egnatia, if fire be laid vpon a certaine hallowed stone there, it will immediatly flame out. Vpon the alter of *Iuno Lacinia* standing as it doth in the open aire, the ashes lie vnmoueable and stir not, blow what stormy winds that will on euery side. Ouer and besides, there be fires scene suddenly to arise, both in waters and also about the bodies of men. *Valerius Antias* reporteth, That the lake Thrasymenus once burned all ouer: also that *Serv. Tullius* in his childehood, as he lay asleepe, had a light fire shone out of his head: likewise, as *L. Marius* made an oration in open audience to the army, after the two *Scipios*, were slain in Spain, and exhorted his soldiers to reuenge their death, his head was on a flaming fire in the same sort. More of this argument, and in better order, will we write soone hereafter. For now we exhibit and shew the maruells of all things huddled and intermingled together. But in the mean while, my mind being passed beyond the interpretati. on of Nature, hasteneth to leade as it were by the hand the minds also of the readers, through- out the whole world.

CHAP. CVIII.

¶ The measure of the whole earth in length and breadth.

THIS our part of the earth whereof I speak, floting as it were within the Ocean (as hath bin said) lieth out in length most from the East to the West, that is to say from India to *Hercules* pillars consecrated at Gades: and as mine Author *Artemidorus* thinketh, it containeth 85 hundred, & 78 miles. But according to *Isidorus*, 98 hundred, and 18. *M. Artemidorus* addeth moreouer, from Gades within the circuit of the sacred Promontorie, to the Cape Attabrum, where the front and head of Spain beareth out farthest in length 891 miles. This measure runneth two waies. From the riuer Ganges and the mouth thereof, whereas he dischargeth himself into the East Ocean, through India and Parthyene vnto Myriandrum a city of Syria, scituare vpon the gulfe or Firch of Issa, 52 hundred & 15 miles. From thence taking the next voyage to the Island Cyprus, to Patara in Lycia, Rhodes and Astypataa (Islands lying in the Carpathian sea) to Tanarus in Laconia, Lilybæum in Sicilie, Calaris in Sardinia, 34 hundred & 50 miles. Then to Gades 14 hundred and 50 miles. Which measures being put al together, make in the whole from the said sea, 85 hundred 78 miles. The other way, which is more certain, lieth most open and plain by land, to wit, from Ganges to the riuer Euphrates 50 hundred miles and 21. From thence to Mazaca in Cappadocia 244 miles, & so forward through Phrygia and Caria, to Ephesus, 400 miles, 98. From Ephesus through the Ægean sea to Delos 200 miles. Then to Isthmus 212 miles. From thence partly by land, and partly by the Laconian sea and the gulfe of Corinth, to Patræ in Peloponnesus 202 miles and an halfe: so to Leucas 86 miles & a halfe, and as much to Corcyra. Then to Acrocerania 132 miles and a halfe: to Brundisium 86 miles and a halfe: so to Rome 3 hundred miles and 60. Then to the Alpes as far as the village Cincomagus 518 miles. Through France to the Pyrenæan hills, vnto Illiberis 556 miles, to the Ocean and the sea coast of Spaine 332 miles. Then the cut ouer to Gades seven miles and a halfe. Which measure by *Artemidorus* his account, maketh in all 86 hundred 85 miles. Now the bredth of the earth, from the Meridian or South-point, to the North, is collected to be lesse almost by the one halfe, namely, 54 hundred and 62 miles. Whereby it appeareth plainly, how much of the one side heate of fire, and on the other side frozen water hath stolne away. For I am not of minde that the earth goeth no farther than so, for then it should not haue the forme of a globe, but that the places on either side be vnhabitable, and therefore not found out and discovered. This measure runneth from the shore of the Æthiopian Ocean, which now is habited, vnto Meroe, 550 miles. From thence to Alexandria 1200 and 40 miles. So, to Rhodes 583 miles;

A miles; to Gnidus, 84 miles and a halfe; to Cos, 25 miles; to Samus, 100 miles; to Chius, 84 miles; to Mitylene, 65 miles; to Tenedos, 28 miles; to the cape Sigæum, 12 miles and a halfe; to the mouth of Pontus, 312 miles and a halfe; to Carambis the promontorie, 350 miles; to the mouth of Mæotis, 312 miles and a halfe; to the mouth of Tanais, 265 miles: which voiage may be cut shorter (with the vantage of sailing directly) by 89 miles. From the mouth of Tanais, the most curious Authors haue set downe no measure. *Artemidorus* was of opinion, that all beyond was vnfound and not discovered; confessing, that about Tanais the Sarmatian Nations do inhabit, who lie to the North pole. *Isidorus* hath added hereto twelue hundred miles, as far as to Thule: which is a iudgement of his grounded vpon bare guesse and coniecture. I take it, that the borders of the Sarmatians are knowne to haue no lesse space of ground than this last mentioned commeth vnto. And otherwise, how much must it be, that would containe such an innumerable company of people shifting their seats euer and anon, as they doe. Whereby I guesse, that the ouer-measure of the clime inhabitable is much greater. For I know certainly, that Germany hath discovered mightie great Islands not long since. And thus much of the length and breadth of the earth, which I thought worth the writing. Now the vniuersall compasse and circuit thereof, *Erastosthenes* (a great Clerke verily for all kinde of literature, & in this knowledge aboue all others doubtlesse most cunning, and whom I see of all men approued and allowed) hath set downe to be 252000 stadia. Which measure, by the Romanes account and reckoning, amounteth to 300 hundred and 15 hundred miles. A wonderous bold attempt of his! but yet so exquisitely calculated and contriued by him, that a shame it were not to beleue him. *Hipparchus*, a wonderful man both for conuincing him, and all his other diligence besides, addeth moreouer little lesse than 25000 stadia.

CHAP. CIX.

¶ The Harmonicall measure, and Circumference of the World.

Dionysidorus in another kind would be beleued: (for I will not beguile you of the greatest example of Grecian vanitie.) This man was a Melian, famous for his skill in Geometrie: he dyed very aged in his owne countrey: his neere kins-women (who by right were his heires in remainder) solemnized his funerals, & accompanied him to his graue. These women (as they came some few daies after to his sepulchre for to performe some solemn obsequies thereto belonging) by report, found in his monument an Epistle of this *Dionysidorus*, written in his owne name, To them aboue, that is to say, To the liuing: and to this effect, namely, That he had made a step from his sepulchre to the bottome and centre of the earth, and that it was thither 42000 stadia. Neither wanted there Geometricians, who made this interpretation, that he signified that this Epistle was sent from the middle centre of the earth, to which place downward from the vppermost aloft, the way was longest; and the same was iust halfe the diametre of the round globe: whereupon followed this computation, That they pronounced the circuit to be 255000 stadia. Now the Harmonicall proportion, which forceth this vniuersalitie and nature of the World to agree vnto it selfe, addeth vnto this measure 7000 stadia, and so maketh the earth to be the 96000 part of the whole world.

F

THE

THE THIRD BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proeme, or Preface.

Hitherto haue we written of the position and wonders of the Earth, Waters, and Starres: also we haue treated in generall termes of the proportion and measure of the whole world. Now it followeth, to discourse of the parts thereof: albeit this also be iudged an infinite piece of worke, nor lightly can be handled without some reprehension: and yet in no kinde of enterprise pardon is more due; since it is no maruell at all, if he who is borne a mortall man, knoweth not all things belonging to man. And therefore I will not follow one Author more than another, but every one as I shall thinke him most true in the description of each part. Forasmuch as this hath been a thing common in manner to them all, namely, to learn or describe the situations of those places most exactly, where themselves were either borne, or whch they had discovered and seene: and therefore neither will I blame nor reprove any man. The bare names of places shall be simply set downe in this my Geographic, and that with as great breuitie as I can: the excellency, as also the causes and occasions thereof, shall be deferred to their severall and particular treatises: for now the question is as touching the whole earth in generalitie, which mine intent is to represent unto your eyes: and therefore I would haue things thus to be taken, as if the names of countries were put downe naked, and void of renowne and fame, and such onely as they were in the beginning, before any acts there done; and as if they had indeed an indument of names, but respectiue onely to the World and vniuersall Nature of all.

Now the whole globe of the earth is diuided into three parts, Europe, Asia, and Africa. The beginning we take from the West and the Firth of Gades, even whereas the Atlantick Ocean breaking in, is spread into the Inland and Mediterranean Seas. Make your entrance there, I meane at the Streights of Gibraltar, and then Africa is on the right hand, Europe on the left, and Asia before you iust betweene. The bounds confining these, are the riuers Tanais and Nilus. The mouth of the Ocean at Gades (whereof I spake before) lyeth out in length 15 miles, and stretcheth forth in breadth but fiew, from a village in Spaine called Mellaria, to the promontorie of Africke, called the VWhite, as Turannius Gracula born thereby, doth write. T. Liuius, and Nepos Cornelius haue reported, that the breadth thereof where it is narrowest, is fiew miles ouer, but ten miles where it is broadest. From so small amouth (a wonder to consider) spreadeth the sea so huge and so vast as we see, and withall, so exceeding deepe, as the maruell is no lesse in that regard. For why? in the verie mouth thereof, are to be seen many barres and shallow shelles of white sands (so ebbe is the water) to the great terror of shippes and sailers passing that way. And therefore many haue called those Streights of Gibraltar, The entrie of the Mediterranean Sea. Of both sides of this gullet, nere vnto it, are two mountaines set as frontiers and rampiers to keepe all in: namely, Abila for Africke, Calpe for Europe, the vtmost end of Hercules Labours. For which cause, the inhabitants of those parts call them, the two pillars of that God, and doe verily beleuee, that by certaine draines and ditches digged within the Continent, the maine Ocean before excluded, made way and was let in, to make the Mediterranean Seas, where before was firme land: and so by that meanes the very face of the whole earth is cleane altered.

CHAP.

CHAP. I.

¶ Of Europe.

And first, as touching Europe, the nource of that people which is the conqueror of all nations; and besides, of all lands by many degrees most beautifull: which may for right good cause, haue made not the third portion of the earth, but the one halfe (diuiding the whole globe of the earth into two parts): to wit, from the riuier Tanais vnto the Streights of Gades. The Ocean then, at this space abovesaid, entreth into the Atlantick sea, and with a greedie current drowneth those lands which dread his coming like a tyrant; but where he meeteth with any that are like to resist, those he passeth iust by, and with his winding turns and reaches he eateth and holloweth the shore continually to gaine ground, making many noukes and creekes euery where: but in Europe most of all, wherein foure especiall great gulfes are to be seene.

Of which, the first, from Calpe the vtmost promontorie (as is aboue said) of Spaine, windeth and turneth with an exceeding great compass, to Locri, and as far as the promontorie Brutium. Within it lieth the first land of all others, Spaine; that part I meane, which in regard vs at Rome, is the farther off, and is named also Boetia. And anon from the Firth Virgitanus, the hither part, otherwise called Tarraconensis, as far as to the hills Pyrenæi. That farther part of larger Spaine is diuided into two prouinces in the length thereof: for on the North side of Boetia, lyeth Lusitania afront, diuided from it by the riuier Ana.

This riuier beginneth in the territorie Laminitanus of the hither Spaine, one while spreading out it selfe into broad pooles or meeres, otherwhiles gathering into narrow brooks: or altogether hidden vnder the ground, and taking pleasure to rise vp oftentimes in many places, falleth into the Spanish Atlantick Ocean. But the part named Tarraconensis, lying fast vpon Pyrenæus, & shooting along all the side thereof, and withal, stretching out it selfe ouerthwart & crosse from the Iberian sea to the Gauls Ocean, is separated from Boetia & Lusitania, by the mountaine Salarius, and the cliffes of the Orcanes, Carpetanes, and Asturians.

Boetia, so called of the riuier Boëtis, that cutteth in the mids, out-goeth all other prouinces for rich furniture, and a certaine plentifull trimnesse and peculiar beautie by it selfe. Therein are held foure solemne Iudiciall great assizes and Parliaments, according to foure Counties or shires; to wit, the Gaditane, Cordubian, Astigitane, and Hispalensis. Townes in it are all in number 175; whereof there are colonies eight, free Boroughes, eight; townes indued with the antient franchises of Latium 29; with freedome six; Confederate, foure; Tributarie paying custome, 120. Of which, those that be worth the naming, and are more currant in the Latine tongue, be these vnder written: to wit, on the riuier Ana side and the Ocean coast, the citie Ossonoba, furnished also Lusitania. There run between, Luxia and Vrium, two riuers. The hills Ariani, the riuier Boëtis: the shore Corense with a winding creek.ouer against which, lyeth Gades, to be spoken of among the Ilands. The cape or head of Iuno; the haven Besippo. Townes, Belon, and Mellaria. The Streights or Firth out of the Atlantick sea. Carteia, called Tertessos by the Greekes; and the mountaine Calpe. Then, within the firm land, the towne Barbefula, with the riuier. Item, the towne Salbula, Suel-Malacha vpon the riuier of our Confederates. Next to these, Menoba with a riuier: Sexi-firmum, furnished Iulium: Selaubina, Abdera, and Murgis the frontier towne of Boetia. All that whole coast, M. Agrippa thought to haue had their beginning and descent from the Carthaginians. From Ana, there lyeth against the Atlantick Ocean, the region of the Bastuli and the Turduli.

M. Varro saith, that there entered into all parts of Spaine, the Herians, Persians, Phœnicians, Celtes, and Carthaginians or Africans: for *Lusus*, the companion of Father *Liber* or *Liba* (which signifieth the frantick furie of those that rageth with him) gaue the name to Lusitania; and *Pun* was the gouernour of it all. But those things which are reported of *Hercules* and *Pyrene*, or of *Saturne*, I thinke to be as vaine and fabulous tales as any other. As for Boëtis, in the Tarraconensis prouince, rising, not as some haue said, at the towne Mentesa, but in the chafe or forrest Tugrenis, which the riuier Tader watereth, as it doth the Carthaginian pale also at Ilorcum, shunneth the funerall fire and sepulchre of *Scipio*: and turning into the West, maketh toward

the Atlantick Ocean, adopting the prouince and giuing it his owne name, is at first but small, G howbeit receiueth many other riuers into it, from which it taketh away both their name and their waters. And first being entred from Ossigitania into Boetia, running gently with a pleasant channel, hath many townes both on the left hand & the right, seated vpon it. The most famous and populous between it & the sea coast in the Mediterranean part thereof, are Segeda, furnamed Augurina: Iulia, which is also called Findentia: Virga, otherwife Alba, Ebura, otherwife Cereolis: Illiberi, which is also Liberini: Ilipua, named likewise Laus. Artigi or Iulienfes: Vesci the same that Fautia: Singilia, Hegua, Arialdunū, Agla the lesse, Bæbro, Castra Vinaria, Epistibum, Hipponoua, Illurco, Oſca, Eſcua, Succubo, Nuditatum, Tucci the old, all which belong to Baſtitania, lying toward the sea. But within the countie or iurisdiction of Corduba, about the very riuier standeth the towne Offigi, which is furnamed Laconicum: Illiturgi called also Forum Iulium. Ipaſturgi the same that Triumphale, Sitia: & 14 miles within the country Obulco, which is named Pontificense. And anon (you shall see) Ripepora, a town of the confederate, Sacili, Martialum, Onoba. And on the right hand Corduba, furnamed Colonia Patritia: and then beginneth Boetis to be nauigable, & not before. As you go lower, you shall find towns Carbulco, Decuma, the riuier Singulis, falling into the same side of Boetis. The townes of the country Hispalensis be these, Celtica, Axatiara, Arruci, Menoba, Ilipa, furnamed Italica. And on the left hand, Hispalis a colony, furnamed likewise Romulensis. But right forward opposit to it, the town Offet, which hath a name besides, Iulia Constantia: Vergentum, which also is the same that Iulij Genitor, Hippo Caurasium, the riuier Menoba, which also entreth into Boetis on the right side. But within the washes & downs of Boetis there is the town Nebrissa furnamed Veneria & Colobona: also colonies, viz. Alſa, which is called Regia: & in the mid-land part, Aſido, which is the same that Caſariana. The riuier Singulus breaking into Boetis in that order as I haue said, runneth hard by the Colony Aſtigintania, furnamed also Augusta Firma, & so forward it is nauigable. The rest of the Colonies belonging to this Countie are free, & enjoy immunitie of tribute, namely, Tucci, which is furnamed Augusta Gemella: Itucci, the same that Virtus Iulia, Artubi all one with Claretas Iulia [i. excellencie of Iulius.] Vrſo, which is Genua Vrbanorum: & among these, Munda, which together with Pompeius ſon, was taken. Free towns, Aſtigi the old, & Ostippo: tributarie, Callet, Calucula, Castra Gemina, Ilipula the lesse Merucra, Sacrana, Obulcula, Oningis. As a man commeth from the coast, neere to the riuier Menoba, which also will beare a ship, there dwel not far off the Alontigicili, & Aloſtigi. But all that region which without the forenamed, reacheth from Boetis to the riuier Ana, is called Beturia: diuided into two parts, & as many sorts of people: to wit, the Celtici, who meet with Lusitania, and are within the diuision or county Hispalensis: and the Turduli, who inhabit fast vpon Lusitania and Tarraconensis: and they owe seruice to the County-court of Corduba: as for the Celtici, manifest it is, That they came from the Celtiberians out of Lusitania, as appeareth by their religion, tongue, & names of towns, which in Bætica are distinguished by their additions or surnames, to wit, Seria, which is called Fama Iulia: Vcultuniacum, which now is Curiga: Laconimurgi, Constantia Iulia, Terresibus is now Fortunales, & Callensibus, Emanici. Besides all these, in Celtica Acinippo, Arunda, Arunci, Turobrica, Laſtigi, Alpeſa, Sæpona, Serippo. The other Beturia, which we said contained the Turduli, & belonged to the countie of Corduba, hath towns of no base account, Arſa, Mellaria and Mirobrica: and regions or quarters Oſrutigi, and Siſapone. Within the Countie of Gades there is of Romane citizens a town called Regina: of Latines there are Læpia, Vlia, Carſa furnamed Aurelia, Vrgia, which is likewise named Castrum Iulium: also, Caſaris Salutarienſis. But tributaries there be these, Beſaro, Beſippo, Berbeſula, Lacippo, Beſippo, Callet, Cappagum, Oleastro, Itucci, Prana, Lacibi, Saguntia, Andoriſippo. The whole length of it, M. Agrippa hath set down 463 miles, & the breadth 257. But for that the bounds reached forward as far as to Carthage, which cause breedeth oftentimes errors in the taking of the measures, whiles in one place the limits of the prouinces were changed, and in another the paces in iourning were either more or lesse, also, considering the seas in so long continuance of time haue incroched here vpon the land, and the banks again gotten there of the sea, and beare farther in; also, for that the reaches of the riuers haue either turned crooked or gone streight & direct: ouer and besides, for that some haue begun to take their measure from this place, others from that, and gon diuers waies: it is by these means come to passe, that no twain accord together in one song, as touching their measure & Geographic.

CHAP.

CHAP. II.

¶ The length and breadth of Bætica.

THE length of Boetia at this day from the bound of the town Castulo vnto Gades, is 475 miles: and from Murgi the maritime coast or lands end, more by 22 miles. The breadth from the edge or border of Carteia, is 224 miles. And verily, who would beleue, that Agrippa, a man so diligent, and in this worke principally, so curious, did erre, when he purposed to set out a map of the whole world openly to be seene of the whole city, and namely, when Augustus Caesar of happy memorie, joined with him: For he it was that finished the Porch or gallerie begun by Agrippa's sister, according to his will, appointment, and direction, which contained the laid pourtraict.

CHAP. III.

¶ The hither or higher Spaine.

THE old forme of the hither Spaine is somewhat changed, like as of many other prouinces: considering that Pompey the great in his triumphant trophies which he erected in Pyreneus, restifieth, That 846 townes between the Alps and the marches of the farther or lower Spain, were subdued by him and brought to obedience. Now, is the whole prouince diuided into 7 counties, the Carthaginian, the Tarraconian, Caſar Auguſtani, Cluniensis, Aſturia, Lucensis, & Bracarum. There are besides Islands, setting aside which, without once naming them, and excepting the cities that are annexed to others, the bare prouince containeth 294 townes. In which there be 12 colonies, townes of Roman citizens thirteen, of old Latines ſeuenteen, of allies within the league, one, tributarie, 136. The first in the very frontiers thereof, be the Baſtuliens: behind them in such order as shall be said, namely, those Inlanders that inhabit within-forth, the Mentefanes, Oretanes, and the Carpetanes vpon the riuier Tagus. Neere to them, the Vaccæans, Vætones, Celtiberians, and Arrebaci. The townes next to the marches, Vrci, and Barea laid to Boetia: the countrey Mauritania, then Deitania: after that Contestania, and new Carthage, a colony. From the promontorie whereof called Saturnes cape, the cut ouer the sea to Caſaria a citie in Mauritania, is of 187 miles: In the residue of that coast is the riuier Tader: the free colonie Illici, of which, a frith or arme of the sea tooke the name Illicitanus. To it owe seruice and are annexed the Icositanes. Soon after, Lucentum a towne of the Latines. Dranium a tributarie, the riuier Sucro, which was sometime the frontier towne of Contestania. The region Edetania, which retireth inward to the Celtiberians, hauing a goodly pleasant poole bordering along the front of it. Valentia, a colony lying three miles from the sea. The riuier Turium: and iust as far from the sea, Saguntum, a towne of Roman citizens, renowned for their fidelitie. The riuier Idubeda, and the region of the Illegæones. The riuier Hebre, yeelding such riches of trafficke and commerce, by reason that it is nauigable: which beginneth in the Cantabrian countrey, not far from the towne Inliobrica, and holdeth on his course 430 miles: and for 260 of them, euen from the towne Varia, carrieth vessels of merchandise: in regard of which riuier, the Greekes named all Spaine Iberia: the region Coſſetania, the riuier Subi, the colonie Tarraco, built by the Scipios, like as Carthage by the Africans. The countrey of the Illegætes, the towne Subur: the riuier Rubricatum, and from thence the Lacetanes and Indigætes. After them in this order following, within-forth at the foot of Pyreneus, the Auſetanes, Itanes, & Lacetanes: and along Pyreneus the Cerretanes, and then the Vascones. In the edge or marches thereof, the colony Barcino, furnamed Faudentia. Towns of Roman citizens, Bætulo, Illuro, the riuier Lanum, Blandæ: the riuier Alba, Emporia: two there be of these, to wit, of the old inhabitants, and of the Greeks, who were the off-spring descended from the Phocæans. The riuier Tichus. From whence to Pyrenæa Venus, on the other side of the promontorie, are fortie miles. Now besides the forenamed, shall be related the principall places of marke as they lie in euery countie. At Tarracon there plead in court foure and fortie States. The most famous and of greatest name among them, be of Roman citizens the Dertufanes, and Bisgargitanes: of Latines, the Auſetanes and Cerretanes furnamed Iulianes: they also who are named Auguſtanes, the Sedetanes, Gerundenſes, Geſſarians, Tearians, the same that Iulienſes. Of Tributaries,

F 3

Tributaries,

aries, the Aquicaldenses, Onenses, and Batulonenses. Cæsar Augusta, a free colony, on which the riuer Iberus floweth: where the towne before was called Salduba: these are of the region Sedetania, and receiue 52 States: and among these, of Roman citizens the Bellitanes and Celsenses: and out of the Colonie, the Calaguritanes surnamed also Nascici. The Iberdians of the Surdaons Nation, neere vnto whom runneth the riuer Sicoris. The Oficians of the region Vescetania, and the Turiafionenses. Of old Latins, the Cascantenses, Erganicenses, Gracchuritanes, Leonices, Offigerdenses. Of confederats within the league, the Tarragenenses. Tributaries besides, the Arcobricenses, Andologenses, Arocelitans, Buriafionenses, Calaguritanes surnamed Fibularenenses, Complutenses, Carenenses, Cincenses, Gortonenses, Dammanitanes, Larrenenses, Iturisenenses, Ispalenses, Ilumbetitanes, Lacetanes, Vibienenses, Pompelonenses and Segienenses. There resort to Carthage for law 62 severall States, besides the Islanders. Out of the colonie Accitana, the Gemellenses, also Libisofona surnamed Foraugustana: which two are indue with the franchises of Italy: out of the colonie Salariensis, the Oppidans of old Latium, Castulonenses, whom Cæsar calleth *Vandales*. The Setabitanes, who are also Augustanes, and the Vallerienenses. But of the Tributaries, of greatest name be the Babauenses, the Bascianes, the Confaburenenses, Dianenses, Egelestanes, Ilorcitanis, Laminitanis, Mentefami, the same that Oritani, and Mentelani who otherwise are Bastuli: Orcitanes who also are called Germani, the chiefe of the Celtiberians, the Segobrigenses, and the Tolitanes of Carpetania, dwelling vpon the riuer Tagus. Next to them the Viacienses and Virgilienses. To the assises or law court Clunienensis, The Varduli bring 14 nations, of which I list to name none but the Albanenses: but the Turmodigi foure, among whom are the Segisamonenses, Sagisameiulienenses. To the same assises, the Carietes & the Vennenses do go out of five cities, of which the Velienenses are. Thither repaire the Pelendones, with 4 states of the Celtiberians, of whom the Numantins were famous: like as in the 18 cities of the Vaccæans, the Intercarienses, Pallantini, Lacobricenses, & Caucentenses: for in the foure states of the Cantabrigi, only Iuliobrica is named: in the 10 states of the Autrigones, Tritium, & Vironesca. To the Arouaci the riuer Aroua gaue name. Of them there be 7 townes; to wit, Saguntia and Vxama, which names be often vsed in other places: besides Segonia, and Noua-augusta, Termes, and Clunia it selfe the very vtmost bound of Celteberia. all the rest lie toward the Ocean, & of the abouenamed the Varduli together with the Cantabrigi. To these there are ioined 12 nations of the Astures, diuided into the Augustanes & Transmontans, hauing a stately city Asturica: among these are reckned, Giguri, Pefici, Lanfenses, & Zocla. The number of the whole multitude ariseth to 240000 pols of free men, besides slaues. The county or iurisdiction Lucensis compriseth 16 townes (besides the Celticks and Lebunians) of base condition, and hauing barbarous names; howbeit, of free-men to the number welneere of 166000: in like maner 24 cities, which affoord 275000 pols, owe seruice to the court of Bracarum: of whom besides the Bracarians themselues, the Vibili, Celerini, Gallæci, Equifilici & Quinquerni, may be named without disdain and contempt. The length of the hither Spain, from Pyrenæus to the bound of Castulo is 607 miles, & the coast therof somewhat more. The bredth from Tarracon to the shore of Alarfon, 307 miles: & from the foot of Pyrenæus, where, between two seas it is pointed with the streights, & so opening it selfe by little & little from thence, till it come to touch the farther Spain, it is as much, and addeth somewhat more. to the bredth: all Spain throughout in manner is full of metall mines, as lead, yron, brasse, siluer, and gold: the hither part thereof aboundeth besides with stone glasse, or glasse stones: and Bœtica particularly with vermilin. There be also there quarries of Marble. Vnto all Spaine throughout, *Vespasianus Augustus* the Emperour, tossed with the tempests and troubles of the commonweale, granted the franchises of Latium. The mountaines Pyrenæi do confine Spaine and France one from the other, lying out with their promontories into two contrary seas.

CHAP. IIII.

¶ The Prouince Narbonensis.

That part of Gallia which is washed and beaten vpon with the Mediteranean sea, is called the prouince Narbonensis, named afore-time Braccata, diuided from Italy by the riuer Varus and the Alpes, most friendly mountaines to the Romane Empire: and from the other parts of Gaule, on the North side, by the hills Gebenna & Iura. For tillage of the ground

- A for reparation of men, regard of ciuilitie and manners, and for wealth, worthy to be set behinde no other prouinces whatsoeuer: and in one word, to be counted Italy, more truly than a prouince: in the edge or marches thereof lyeth the countrey of the Sardaons; & within the region of the Confluarones. The riuers be Tecum and Vernodubrum: the townes, Illiberis (a poore relique and simple shew of a citie to that it was in old time) & Ruscio, inhabited by the Latines. The riuer Atax springing out of Pyrenæus, runneth through the lake Rubrensis, & floteth ouer it. *Narbo Martius* a colonie inhabited by the Legionaries of the tenth legion, twelue miles distant from the sea. Rivers, Araris and Liria. Townes in the other parts, scattering here and there by reason of pooles and meeres lying before them: namely, Agatha, in times past belonging to the Massilians, and the region of Volsæ Tectofages. Also, where Rhoda of the Rhodians was, whereof Rhodanus tooke name, the most fruitfull riuer by far of all Gallia, running swiftly out of the Alps through the lake Lemanus, & carrying with it the dead and slow riuer Araris; and Isara running as fast as it selfe, together with Druentia. The two smal mouths or passages therof are called Lybica: of which, the one is Hispanienum, the other Metapinum: a third there is besides, and the same most wide and large, named Massalioticum. There be that write, how the towne Heraclea likewise stood vpon the mouth of Rhodanus. Beyond the ditch out of Rhodanus, which was the work of *C. Marius*, & bearing his name, there was a notable poole or meere. Moreouer the town Astromela, and the maritime tract of the Auaticci: and aboue it, the stonie plains, carrying the memoriall of *Hercules* his battels. The region of the Anatilians, and within forth, of the Desuuiates and Cauians. Againe, from the sea, Tricorum, and inward, the region of the Tricolliuocantians, Segouellaunes, and anon of the Allobroges: but in the marches, Massilia of Greeke Phocæans: within the league. The promontorie Citharista, Zaopatus, and the region of the Camatullici. After them, the Suelteri; and aboue them, Verucines: But in the coast along still, Athenopolis vnder the Massilians, Forum Iuij a Colonie of the ninth legion fouldiers, which also is called Parenfis and Classica: in it is the riuer Argenteus: the region of the Oxubij and Ligaunians; aboue whom, are the Suetri, Quarieres, and Adunicates: but in the borders, a Latine towne Antipolis. The region of the Deciates, the riuer Varus gushing out of an hil of the Alpes, called Acema. In the middle part thereof the Colonies, Arelate of the sixth legion fouldiers, Bliteræ of the seuenth, and Arausia of those belonging to the second. In the territorie of the Cauians, Valentia and Vienna of the Allobroges. Latine townes, Aquæ Sextiæ of the Salyans, and Auenio of the Caviens, Apta Iulia of the Vulgientians, Alebecerriorum of the Apollinares, Alba of the Heluans, Augusta of the Tricostines; Anatilia, Aeria, Bormanni, Comacina, Cabellio, Carcasum, of the Volsæ Tectofages: Cessero, Carpentoraeste, of the Menenses: the Cenices, Cambolesti, who are named besides Atlantici, Forum Voconij, Glanum, Livij, Lutevani, who are the same that Foro-neronienenses. Nemausum of the Arecomici, Piscenæ, Ruteni, Sanugenses, and Tolosani, of the Tectofages: The neighbor borderers vpon Aquitane, Tasco-dumetari, Canonienenses, Vmbranici. Two capitall townes of the confederat state of the Vocontians, Vasco and Lucus Augusti. But base townes of no importance nineteene, as 24 more annexed to the Nemausiens, and vnder their Seignorie. To this charter or instrument inrolled, *Galba* the Emperour added of the Alpine inhabitants, the Auaticci and Eproduntij; whose town is named Dima. *Agrippa* saith, that the length of this prouince Narbonensis is 270 miles, and the breadth 248.

CHAP. V.

¶ Italy, Tiberis, Rome, Campania.

Next to them is Italy, and the first of all, the Ligurians: then Hetruria, Vmbria, Latium; where be the mouthes of Tiberis and Rome the head citie of the whole earth, 16 miles distant from the sea: after it is the maritime countrey of the Volsians, and Campania: then Picentium, Lucanum, and Brutium, the furthest point in the South, vnto which from the crooked mountaines of the Alpes, like in mannervnto the Moone croissant, with some parts higher, other lower, Italie shooteth out in length to the seas: from it is the sea coast of Græcia, and soone after, the Salentines, Pediculi, Apuli, Peligni, Ferentani, Marrucini, Vestines, Sabines, Picentes, Gaules, Vmbrians, Thuscans, Venetians, Carnians, Iapides, Istrians, and Liburnians.

Neither

Neither am I ignorant, that it might be thought and that iustly, a point of an vnthankfull G mind and idle withall, if briefly in this sort, and as it were by the way, that land should be spoken of which is the nource of all lands. She also is the mother, chosen by the powerfull grace of the gods, to make euen heauen it selfe more glorious; to gather into one the scattered empires, to soften and make ciuill the rude fashions of other countries; and whereas the languages of so many nations were repugnant, wilde, & sauage, to draw them together by commerce of speech, conference, and parley; to indue man with humanitie; and briefly, that of all nations in the world, there should be one onely country. But here, what should I do? so noble are all the places that a man shal come vnto, so excellent is euery thing, and each state so famous and renowned, that I am fully possessed with them all, and to seeke what to say. Rome citie, the only faire face therein, worthy to stand vpon so stately a necke and pair of shoulders, what worke would it aske thinke you, to bee set out as it ought? the very tract of Campaine by it selfe, so pleasant and goodly, so rich and happie, in what sort should it be described? So as it is plaine and manifest, that in this one place there is the workmanship of Nature wherein she ioieth and taketh delight. Now besides all this, the whole temperature of the aire is euermore so vitall, healthy, and wholesome, the fields so fertile, the hills so open to the Sun, the Forrests so harmlesse, the groues so coole and shadie, the woods of all sorts so bounteous and fruitfull, the mountaines yeelding so many breaching blasts of winde; the corne, the vines, the oliues so plentifull; the sheep so enriched with fleeces of the best wooll, the bulls and oxen so fat and well fed in the necke; so many lakes and pooles, such store of riuers and springs watering it throughout; so many seas and hauens, that it is the very bosom lying open and ready to receiue the commerce of all lands from all parts; and yet it selfe full willingly desireth to lie far into the sea to helpe all mankind. Neither do I speake now of the natures, wits, and fashions of the men; ne yet of the nations abroad subdued with their eloquent tongue, and strong hand. Euen the Greekes (a nation of all other most giuen to praise themselves beyond measure) haue giuen their iudgement of her, in that they called some small part thereof, Great Greece. But in good faith, that which we did in the mention of the heauen, namely, to touch some knowne planets and a few stars, the same must we likewise do in this one part: only I would pray the Readers to remember and carry this away, That I hasten to rehearse euery particular thing through the whole round globe of the earth.

Well then, to begin, Italy is fashioned like for all the world to an Oke leafe, and much larger in length than breadth: to the left side bending with the top, and ending in the figure and fashion of an Amazonian shield; and where that tract of Calabria lyeth which is called Cocinthus, it putteth forth into those two promontories or capes like the moones two hornes; the one, Leucopetra on the right hand; the other Lacinium on the left. In length it reacheth from the foot of the Alps, through Ostia or Prætoria Augusta, directly to the citie of Rome, and so forward to Capua, with a direct course leading to Rhegium a towne situate vpon the shoulder thereof: from which beginneth the bending as it were of the necke; and beareth 1000 and 20 miles. And this measure would grow to be far more, if it went as far as Lacinium, but that such an obliquitie and winding might seem to decline and beare out too much vnto one side. The breadth thereof is diuersly taken, namely, 410 miles between the two seas, the higher and the lower, and the riuers Varus and Arfia. The mids of which breadth (and that is much about the citie of Rome) from the mouth of the riuier Aternus running into the Adriaticke sea, vnto the mouthes of Tiberis, 136 miles, and somewhat lesse: from Novum Castrum by the Adriaticke sea, to Alsum, and so to the Tuscan sea: and in no place exceedeth it in breadth 300 miles. But the full compasse of the whole from Varus to Arfia, is 2004.9 miles. Distant it is by sea from the lands round about, to wit, from Istria and Liburnia in some places 100 miles; from Epirus and Illyricum 50 miles; from Africk lesse than 200, as Varro affirmeth; from Sardinia, an hundred and 20 miles; from Sicilie, a mile and a halfe: from Coreyra lesse than 70; from Issa 50. It goeth along the seas, to the Meridional line verily of the heauen; but if a man examine it exactly indeed, it lyeth betwene the Sun rising in mid-winter, and the point of the Noone-stead.

Now will we describe the compasse and circuit thereof, and reckon the cities; wherein I must needs protest by way of Preface, that I will follow for mine Authour *Augustus* the Emperour of famous memorie, and the description by him made of all Italy, which be diuided into 11 Regions

- A Regions or Cantons. As for the maritime townes, I will set them downe in that order, as they stand, according to their vicinity one to another. But forasmuch as in so running a speech and haffie pen, the rest cannot possibly be so orderly described: therefore in the inland part thereof, I will follow him as he hath digested them by the letters of the Alphabet: but mentioning withall, the colonies or chiefe cities by name, which he hath deliuered in that number. Neither is it an easie matter to know thoroughly their positions and foundations, considering the Ingaune Ligurians (to say nothing of all the rest) were indowed with lands thirtie times, and changed their seats. To begin with the riuier Varus therefore, there offereth to our eie, first the towne Nicæa, built by the Massilians: the riuier Po; the Alpes; the people within the Alpes of many names, but of most marke Capillati, with long haire: the towne Vediantiorum, the Citie Cemelion, or, a towne belonging to the State of the Vediantians, called Cemelion: the port of *Hercules* and *Monachus*, and so the Ligurian coast. Of the Ligurians, the most renowned beyond the Alpes, are the Sallij, Deceates, and Oxubij: on this side, the Veneti, and descended from the Caturiges, the Vagienni, Staryelli, Vibelli, Magelli, Euburates, Casmônates, Veliates, and those, whose townes we will declare in the next coast. The riuier Rutuba, the towne Albium Intemelium, the riuier Merula, the towne Albium Ingaunum, the port or haue towne Vadum Sabatium, the riuier Porciferia, the towne Genua, the riuier Feritor, the Port Delphini, Tigulia: within, Segesta Tiguliorum: the riuier Macra which limiteth Liguria. Now on the back side behind all these townes aboue named, is Apenine, the highest mountain of all Italy, reaching from the Alpes with a continuall ridge of hills, to the streights of Cicilie.
- C From the other side thereof to Padus, the richest riuier in all Italy, all the countrey shining with goodly faire townes, to wit, Liberna, Dertona a Colonie, Iria, Barderates, Industria, Pollentia, Carrea, which also is named Polentia, Foro Fuluij the same that Valentinum, Augusta, of the Vagienni: Alba, Pompei Asta, and Aquæ Staryellorum. And this is the ninth Canton after the Geographie of *Augustus*. This coast or tract of Liguria containeth betwene the riuers Varus and Macra 211 miles. To it is adioined the 7 wherein is Hetruria from the riuier Macra: and it oftentimes changed the name. In old time the Pelasgians chased the Vmbrians from thence: and by them the Lydians did the like, of whose king, named they were Tyrheni: but soon after, of their ceremonies in sacrificing, in the Greeks language *Tyrsi*. The first towne of Hetruria is Luna, famous for the haue; then the Colonie Luca, lying from the sea: and neerer vnto it is Pisa, between the riuier Aufer and Arnus, which took the beginning from *Pelops* and the Pisians, or Atintanians a Greeke nation. Vada Volateranea, the riuier Cecinna. Populonium of the Tuscans in times past, situate only vpon this coast. After these the riuier Prille, and anon after Vmbro, nauigable, and of itooke name: so forward the tract of Vmbria, and the port towne Talamon: Costa Volscientium, a Colonie planted there by the people of Rome, Grauisca, Castrum Novum, Pyrgi, the riuier Carretanus, and Cære it self, standing foure miles within, called Agylla by the Pelasgians who built it: Alsum and Frugena. The riuier Tiberis, distant from Macra 284 miles. Within forth are these Colonies, Falisca descended from Argi, as *Cato* saith, and for distinction is called Hetruscorum. Lucus Feronia, Russellana, Senensis and Sutriua. As for the rest, these they be, Aretini the old, Aretini Fidentes, Aretini Iulieneses, Amitinenfes, Aquesenfes, surnamed Taurini: Vlerani, Cortonenfes, Capenates, Clusines the old, Clusines the new, Fluentini, fast vpon the riuier Arnus that runs before them, Fesula, Ferentinum, Fescennia, Hortanum, Herbanum, Nepet, Nouempagi [i.e. the nine villages] the Shire-wick called Prefecture Claudia, or Foro Clodij: Pistorucin, Perugia, Suanenfes, Saturnini, who beforetime were called Aurinini, Sudertani, Statones, Tarquinienfes, Tuscanienfes, Vetulonienfes, Veientani, Vesentini, Volaterrani surnamed Hetrusci and Volfinienfes. In the same part lie the territories Crustuminius and Caletanus, bearing the names of the old townes. Tiberis, beforenamed Tybris, and before that Albula, from the middest well nere of Apenine, as it lies in length, runs along the marches of the Aretines: small and shallow at the first, and not able to beare a vessell without being gathered together, as it were, by fish-pooles into a head, and so let goe at fluell:
- F as Tina and Glanis which run into him, the which are at the same passe, and require 9 daies for collection of waters, and so are kept in for running out: in case they haue no helpe of rain at all. But Tiberis by reason of the rough, stony, and rugged channell, for all that deuise, hold, on no long course together, but only for troughes, to speake more truly, than boats: & thus it doth for a hundred and fifty miles, not far from Tifernum, Perugia and Orriculum: diuiding as it passeth Hetruria

Hetruria from the Vmbrians and Sabines: and so forth vntill anon, within thirteen miles of the citie [Rome] it parts the Veientian countrey from the Crustumine: and soone after the Fidenate and Latine territories from the Labicane. But besides Tinia and Glanis, he is augmented with two and forty riuers, and especially with Nar and Anio: which riuers being also it selfe nauigable, enclofes Latium behind: and neuerthelesse so many waters and fountaines are brought thereby into the citie, whereby it is able to receiue any ships, be they neuer so great, from the Italian sea; and is the kindest marchant to conueigh all commodities growing and arising in any place of the whole world: it is the onely riuier of all others, to speake of, and more villages stand vpon it and see it, than al other riuers in what land soeuer. No riuier hath lesse liberty than it, as hauing the sides therof enclosed on both hands, & yet he is no quarreller, nor much harm doth he, albeit he hath many and those suddain swellings, and in no place more than in the very citie of Rome do his waters overflow: yet is he taken to be a prophet rather, and a Counsellor to giue warning, yea, and in smelling, more religious and breeding scruple, to speake a truth, than otherwise cruell and doing any great harme. Old Latium from Tiberis to Circeios, was obserued to be in length 50 miles. So small roots at the first took this Empire. The inhabitants thereof changed often, and held it, some one time, some another; to wit, the Aborigenes, Pelasgi, Arcadians, Sicilians, Auruncanes, and Rutilians. And beyond Circeios, the Volscians, Offians, Aufonians, from whence the name of Latium did reach soone after, as farre as to the riuier Liris. In the beginning of it stands Ostia, a Colonie, brought thither and planted by a Roman king: the towne Laurentum, the groue of *Iupiter Indiges*, The riuier Numicius, and Ardea, built by *Danië* the mother of *Perseus*. Then the Colonie Antium, sometimes Aphrodisium: Astura, the riuier and the Island. The riuier Nymphæus, *Clastra Romana* Circeij, in times past an Island, yea and that verily enuioured with a mighty sea (if we beleue *Homer*) but now with a plain. A wonder it is what we are able to deliuer concerning this thing to the knowledge of men. *Theophrastus*, who of strangers was the first that writ (any thing diligently) somewhat of the Romans (for *Theopompus*, before whom no man made mention at all, said only, That the citie was woon by the Gauls: and *Clitarchus* next after him, spake of nothing elle but an embassage sent vnto *Alexander*) this *Theophrastus*, I say, vpon a better ground and more certaintie now than bare hearesay, hath set downe the measure of the Island Circeij to be eightie Stadia, in that booke which he wrote to *Nicodorus* the chiefe Magistrate of the Athenians, who liued in the 460 yeere after the foundation of Rome citie. Whatsoeuer land therefore aboue tenne miles compass lie neere about it, hath beene annexed to the Island. But after that, a yeere, another strange and wonderfull thing fell out in Italy: for not far from Circeij, there is a meere called Pomptina, which *Mutianus*, a man who had beene thrice Consull, reporteth to haue been a place wherein stood 23 cities. Then there is the riuier Vfers, vpon which standeth the towne Tarracina, called in the Volscian tongue Anxur, & where sometime was the citie Amycle, destroyed by serpents. After it is there the place of a caue or peak, the lake Fundanus, & the hauen Cajeta. The town Formia named also Hormia, the ancient seat (as men thought) of the Læstrigones. Beyond it was the towne Pyrae, the Colonie Minturne, diuided asunder by the riuier Liris, called Clanius. The vtmost frontier towne in this part of Latium laid to the other, is Sinuessa, which as some haue said, was wont to be called Sinope. Thence comes to shew it selfe that pleasant and plentifull countrey Campania. From this vale begin the hills full of vineyards, and famous for drunkenness, proceeding of strong wine and the liquor of the grape, commended so highly in all countries: and (as they were wont to say in old time) there was the exceeding strife between father *Liber* and dame *Ceres*. From hence the Setine and Cecubine countries spread forth: and to them ioine the Falerne and Caline. Then arise the mountaines, Maffici, Gaurani and Surrentine. There the Laborium Champaine fields lie along vnder their feet, and the good wheat haruest to make fine frumentie for dainties at the table. The sea-coasts here are watered with hot fountaines, and among other commodities throughout all the sea, they beare the name for the rich purple shell fish, and other excellent fishes. In no place is there better or more kind oyle pressed out of the Oliue. And in this delightfull pleasure of mankind, the Oficians, Grecians, Vmbrians, Tuscanes, and Campanes haue strived who could yeeld best. In the skirt and edge thereof is the riuier Saur, Vulturum the town and riuier both, Liturnum, and Cumo inhabited by Chalcidians, Misenum, the hauen Bajæ, Baule, the pooles Lucrinus and Avernus, neer vnto which was sometime the town Cimmerium. Then Puteoli, called also the Colonie *Dicæarchia*:

After

- A After that, the plaines Phlegraei, and the meere or fenne Acherusia neere to Cumes. And vpon the very stord by the sea side Naples, a citie also of the Chalcidians, the same that Parthenope so called of the tombe of a Sirene or Meermaid: *Herculanum*, *Pompeij*: and where not farre off the mountaine Vesuvius ouerlooketh, and the riuier Sernus runneth vnder the territory of Nuceria, and within nine miles of the sea, Nuceria it selfe. Surrentum with the promontory of *Minerva*, the seat sometime of the Meermaids. From the cape Circeij lies the sea open for faile 78 miles. This is counted the first region of Italy, next Tiberis, according to the description of *Augustus*. Within it are these Colonies, Capua, so called of the Champaine country, *Aquinum*, *Suessa*, *Venafrum*, *Sora*, *Teanum*, named withall *Sidicinum* and *Nola*: the Townes be, *Abellinum*, *Aricia*, *Alba Longa*, *Acerrani*, *Allifani*, *Atinates*, *Aletrinate*, *Agagnini*, *Atellani*, *Afulani*, *Arpinates*, *Auximates*, *Auellani*, *Alfaterni*; and they who of the Latine, Hernick, and Albicane territories, are furnamed accordingly: *Bouillæ*, *Calatia*, *Casinum*, *Calenum*, *Capitulum*, *Cerneturum*, *Cernetani*, who be called also *Mariani*. *Corani* descended from *Dardanus* the *Trojan*; *Cubulterini*, *Castrimonienses*, *Cingulani*, *Fabienfes*, and in the mount Albane, *Foro populienses*. Out of the Falarne territory, *Fusinate*, *Ferentinate*, *Freginate*, *Faraterni* the old, *Fabraterni* the new, *Ficolenfes*, *Fricolenfes*, *Foro-Appi*, *Forentani*, *Gabini*, *Interramnes*, *Succasani*, called also *Lirinate*, *Ilionenses*, *Lauinij*, *Norbani*, *Nementani*, *Preneftini*, whose citie was in times past named *Stephanus*, *Priuernates*, *Setini*, *Signini*, *Suessulani*, *Telini*, *Trebutini* furnamed *Balinienfes*, *Tribani*, *Tusculani*, *Verulani*, *Veliterni*, *Vlurenfes*, *Vluernates*: and aboue also Rome her selfe: the * other name whereof to vtter, is counted in the secret misteries of ceremonies an impious and vnlawfull thing: which after that it was abolished, and so faithfully obserued to right good purpose and for the safetie thereof, *Valerius Soranus* blurted out, and soone after abid the smart for it. I think it not amisse nor impertinent, to insert there in this very place an example of the ancient religion instituted especially for this Silence: for the goddesse *Angerona*, whose holiday is solemnly kept with sacrifices the 2 day before the Kalends of Ianuary, is represented by an Image hauing her mouth fast faled and tied vp. This citie of Rome had 3 gates when *Romulus* left it, or rather foure (if we beleue the most men that write thereof) The wals thereof, when the two *Vespasian*s, Emperors and Censors both, to wit, the Father and *Titus* his son, took the measure, which was in the yere after the foundation of it 828, were in circuit * 13 miles and almost a quarter. It containeth within it, seuen Mountaines, and is diuided * in 14 regions, and 265 crosse streets or carfours, called *Compita Larium*. The measure of the same equall space of ground, running from the gilden pillar *Milliarium*, erected at the head or top of the Rom. Forum, to euery gate which are at this day 37 in number, so ye reckon once the 12 gates alwaies open, and ouerpasse 7 of the old, which are no more extant, maketh 30 miles 3 quarters and better, by a straight line: but if the measure be taken from the same *Milliarium* before said, through the suburbs to the vtmost ends of the houses, and take withall the *Castra Prætoria*, and the pourprise of all the streets, it comes to somewhat about 70 miles: whereunto if a man put the height of the houses, hee may conceiue verily by it, a worthy estimate of the excellency thereof, and confesse that the statelineffe of no citie in the world could be comparable to it. Enclosed it is and fenced on the East-side with the bank or rampier of *Tarquinius* the Proud; a wonderfull piece of worke as any other, and as excellent as the best: for he raised it full as high as the wals, in that side where the aduenue to it was most open and plaine. In other parts, defended it was and fortified with exceeding high wals, or else steepe and craggy hills, but only whereas there are buildings lye out abroad, and make as it were many petty cities. In that first region of Italy there were besides, first for Latium these faire townes of marke, *Satricum*, *Pometia*, *Scaptia*, *Pitulum*, *Politorium*, *Tellene*, *Tifata*, *Cæmina*, *Ficana*, *Crustumium*, *Ameriola*, *Medullia*, *Corniculum*, *Saturnia*, where now Rome standeth. *Antipolis*, which now is *Laniculum*, in one part of Rome: *Antemne*, *Camerium*, *Collatia*: *Amiternum*, *Norbe*, *Sulmo*: and with these, the States that were wont to receiue a dole of flesh in mount Albane, to wit, *Albenses*, *Albani*, *Aefolani*, *Acienfes*, *Abolani*, *Bubetani*, *Bolani*, *Casertani*, *Coriolani*, *Fidenates*, *Forretij*, *Hortenses*, *Latinenfes*, *Longulani*, *Manates*, *Marales*, *Mutucumenses*, *Munienfes*, *Numinienfes*, *Osticulani*, *Ostulani*, *Pedani*, *Pollustini*, *Querquetulani*, *Sicani*, *Sifolenfes*, *Tolerienfes*, *Tutienfes*, *Vimitellarij*, *Vulienfes*, *Venetulani*, *Vicellenfes*. Thus yee see, how of the old Latium, there be 53 States perished and cleane gone, without any token left behinde. Moreouer, in the Campaine countrey, the towne *Stabia* continued vnto the time that *Cn. Pompeius* and *L. Carbo* were

* Valentia

* Somerreade

10.

were

were Consuls, euen vntill the last day of Aprill; vpon which day, *L. Silla* a lieutenant in the Allies war, destroyed it vtterly: which now at this day is turned into graunges and ferme-houses. There is decaied also there and come to finall ruine, *Taurania*. There be also some little relikes left of *Capilinum*, lying at the point of the last gaspe. Moreover *Antius* writes, that *Apollonia* towne of the Latines, was woon by *L. Tarquinius* the King, with the Pillage whereof he began to found the *Capitol*. From *Surrentum*, to the riuer *Silarus*, the *Picentine* country lay for the space of 30 miles, reowned for the *Tuscanes* goodly temple built by *Iason* in the honor of *Iuno Argiva*. Within it, stood the townes *Salernum*, and *Picentia*. At *Silarus*, the third region of Italy, begins together with the *Lucane* and *Brutian* countries: and there also the inhabitants changed not a few times. For held and possessed it was by the *Pelasgi*, *Oenotri*, Italy, *Morgetes*, *Sicilians*, people all for the most part of great Greece: and last of all by the *Lucanes* descended from the *Samnites*, who had to their leader and gouernour, *Lucius*. In which standeth the town *Pæstum*, called by the Greeks *Posidonia*: the Firth or creeke *Pæstanus*, the town *Helia*, now *Velia*. The promontory *Palinurum*, from which creeke retired within-forth, there is a direct cut by water to the columnne regia, 100 miles ouer. Next vnto this, the riuer *Melphes* runneth: also there standeth the towne *Buxentum*, in Greeke, *Pyxus*, and hard by is the riuer *Laus*: a towne there was likewise of the same name. And from thence beginneth the sea coast of *Brutium*, where is to be seen the towne *Blanda*, the hauen *Parthenius* belonging to the *Phocæans*: the Firth *Vibonensis*, the groue *Clampetia*, The towne *Temsa*, called of the Greeks *Temese*: and *Terina* held by the *Croronians*, and the mighty arme of the sea, called the gulfe *Terinæus*: the towne *Consentia*. Within-forth in a demy Island, the riuer *Acheron*, whereof the townesmen are called *Acherontium*. *Hippo*, which now we call *Viboulentia*; the Port of *Hercules*, the riuer *Metaurus*, the towne *Taurentum*, the hauen of *Orestes*, and *Medua*: the towne *Scylleum*, the riuer *Cratais*, mother (as they say) to *Scylla*. Then after it, the columnne *Rhegia*: the *Sicilian* freights or narrow seas, and two capes one ouer-against the other, namely, *Cænis* from Italy side, and *Pelorum* from *Sicily*, hauing a mile and a halfe betweene them: from whence to *Rhegium* is 12 miles and a halfe: and so forward to a wood in the *Apennine*, called *Sila*; and the promontorie or cliffe called *Leucopetra*, 12 miles off. From which, *Locri* (carrying the name also of the promontorie *Zephyrium*) is from *Silarus* distant 303 miles. Here is determined the first gulfe of Europe, wherein be named these seas. First, *Atlantickum* (from which the Ocean sea breaketh in) called of some *Magnum*: the passage whereas it entrencheth, is of the Greeks called *Porthmos*; of vs, *Fretum Gaditanum*. [The freights of *Gebralter*] when it is once entred the *Spanish* sea, so farre as it beareth vpon the coasts of *Spaines*: *Ofothers*, *Ibericum*, or *Balearicum*: and anon it taketh the name of *Gallicum*, or the *French* sea, right before the prouince *Narbonensis*: and after that, *Ligusticum*: from whence all the way to the Island *Sicilie*, it is called *Tuscum*; which some of the *Grecians* terme *Notium*, others *Tyrrhenum*, put most of our countrimen *Inferum*. [The nether sea.] Beyond *Sicily* as farre as to the *Salentines*. *Polybius* calleth it *Aufonium*: but *Erato* *ilbenes* nameth all the sea *Sardonum*; that is between the mouth of the Ocean and *Sardinia*: and from thence to *Sicilie*, *Tyrrhenum*; and from it as far as to *Creta*, *Siculum*: from which it is hight *Creticum*. The Islands discovered along these seas, were these: The first of all, those which the Greeks named *Pityusæ*, of the Pine shrub or plant; but now, *Ebusus*: they are both a State confederate, and a narrow arme of the sea runneth between them; they are 42 miles ouer. From *Dianium*, they lie 70 *stadia*: and so many are there betweene *Dianium* and *Carthage*, by the maine land: and as much distance from *Pityusæ* into the maine Ocean, lie the two *Balear* Islands; and toward *Suero*, *Colubaria*. These *Balears* in their warre-seruice vse much the sling, and the Greeks name them *Gymnesiæ*. The bigger of them is an hundred miles in length, and in circuit 380. Townes it hath of *Romane* citizens, *Palma* and *Pollentia*: of *Latines*, *Cintum* and *Cunicia*: as for *Bochri*, it was a towne confederate. From it, the lesser is thirtie miles off, taking in length 60 miles, and in compass 150. Cities in it, be *Iamno*, *Sanifera*, and *Mago*. From the bigger 12 miles into the sea, lieth the Isle *Capraria*, which lies in wait for all shipwrack: & ouer-against the city *Palma*, *Menaria*, and *Tiquadra*, and little *Annibalis*. The soile of *Ebusus* chafeth serpents away, but that of *Colubaria* breeds them: and therefore dangerous it is for all that come into it, vnlesse they bring with them some of the *Ebusian* earth. The Greeks call this Island, *Ophiusa*. Neither doth *Ebusus* breed any Conies; which are so common in the *Balears*, that they eate vp their come.

There

A There be as it were 20 more little ones among the sheldes of the sea. Now in the maritime coast of *Gallia* in the very mouth of *Rhodanus*, there is *Metina*; and soone after, that which is called *Blascon*; and the three *Stœchades*, called so of their neighbors the *Massilians*, for the order and ranke wherein they stand; and they giue them euery one a seuerall name, to wit, *Prote*, *Mese* (which also is called *Pomponiana*) and the third, *Hypea*. After them, are *Sturium*, *Phœnice*, *Phila*, *Lero*, and *Lerina* ouer-against *Antipolis*; wherein also is a token or memoriall of the towne *Vergaonum*.

CHAP. VI.

¶ Of Corsica.

B

I N the *Ligurian* sea is *Corsica* the Island, which the Greekes called *Cyrenos*, but nearer it is to the *Tuscan* sea; it lyeth out from the North into the South, and containeth in length an hundred and fiftie miles: in breadth for the most part it beareth fiftie: in circuit 322: distant it is from the *Washes* or *Downes* of *Volaterra* 62 miles. Cities it hath 35: and these colonies, to wit, *Mariana*, planted there by *C. Marius*: *Aleria*, by *Dictator Sylla*. On this side of it is *Oglasa*; but within 60 miles of *Corsica*, there is *Planaria*, so called of the forme thereof, so flat it is and leuell with the sea; and therefore deceiue many a ship that runneth aground vpon it. Bigger than it are *Virgo* and *Capraria*, which the Greekes called *Ægilos*. In like manner *Ægillum* & *Dianium*, the same that *Artemisia*, both lying ouer-against the coast *Cosanum*. Other small ones also, as *Mænaria*, *Columbrarie*, *Venaria*, *Ilua*, with the yron mines, in circuit an hundred miles (ten miles from *Populonia*) called of the Greeks, *Æthalia*: from it is *Planafia* 39 miles off. After them, beyond the mouthes of *Tybre* in the *Antian* creeke, is *Astura*, and anon *Palmaria*, *Sinonia*, and iust against *Formiæ*, *Pontiæ*. But in the *Puteolan* gulfe, *Pantadaria* and *Prochyta*, so called, not of *Æneæ* his nource, but because it was broken off by the gushing betweene of the sea from *Ænaria*. *Ænaria* it selfe tooke that name of *Æneæ* his ships that lay in rode there, called by *Homer* *Inarime*, of the Greeks *Pitheculus*, not for the number of Alps there, as some haue thought, but of the worke houses and furnaces of potters that made earthen vessels, as tunnes and such like, to furnish Italy with. Betweene *Pausilypus* and *Naples*, *Megariss*; and soone after, eight miles from *Surrentum*, *Capræ*, renowned for the castle there of *Prince Tyberius*; and it beareth in compass four hundred miles. Anon you shall see *Leucothea*: but without your kenning lyeth *Sardinia* fast vpon the *Africke* sea, but lesse than nine miles from the coast of *Corsica*: and still those freights are made more narrow by reason of small Islands, named *Cuniculariæ*. Likewise *Phintonis* and *Fossæ*, whereof the very sea it selfe is named *Taphros*.

CHAP. VII.

¶ Of Sardinia.

S ARDINIA on the East side beareth 188 miles, on the West, 170, Southward, 74, and Northward 122: so that in all, it taketh vp the compass of 560 miles. It is from the Cape of *Caraleis* to *Africke* 200 miles: from *Gades* it is distant 1400 miles. It hath two Islands on that side where the Promontorie *Gorditanum* standeth, which be called *Hercules* Islands: of *Sulfenses* cape side, *Enosis*; of *Caralitani*, *Ficaria*: some set not far from it the Islands *Belarides*, and *Collodes*: and another which they call *Heras Lutra*, i. *Innoes* lauer, or *Hieraca*. The States of greatest name therein, be the *Ilien*ses, *Balari*, and *Corfi*: and of the foure townes, the chiefe are inhabited by the *Sulcitanes*, *Valentines*, *Neapolitans*, *Bosenses*, and *Caralitani* who are *Roman* enfranchised citizens, and *Norenses*. One colonie there is in it and no more, which is called, *Ad Turrim Libysonis*. This island *Sardinia*, *Timæus* called (of the fashion of a shoer or slipper) *Sandalioris*: but *Myrsyllus*, for the resemblance of a foot-step, *Ichnusa*. Ouere-against the creeke *Pæstanum*, there is *Leucasia*, called so of a Mere-maid or *Sirene* there buried: against *Vestia*, there lie *Pontia* and *Issia*, both iointly called by one name *Oenotides*; a good presumption and argument that *Italie* was possessed by the *Oenotrians*. And against *Vibo*, other little ones, called *Ithacesiæ*, the watch townes of *Ulysses*.

G

CHAP.

is there the town Baſta, and Hydruntum in the ſpace of nineteen miles, to make a partition betweene the Ionian and Adriaticke ſeas, through which is the ſhortest cut into Greece ouer againſt the towne Apollonia, where the narrow ſea running between, is not aboue fiftie miles ouer. This ſpace between, *Pyrrhus* king of Epirus, was the fiſt, that intending to haue a paſſage ouer on foot, thought to make bridges there: after him *M. Varro*, at what time as in the Pyrates warre he was Admirall of *Pompeies* fleet. But both of them were let and ſtopped with one care or other beſides. Next to Hydrus there is Solotum, a citie not inhabited: then, Fratuertium: the hauen Tarentinus, the gariſon towne Lupia, Baſcium. Cælium, Brundisium fiſteene miles from Hydrus, as much renowned as any towne of Italy for the hauen, for the ſurer ſailing, although it be the longer, and the citie of Illyricum Dyrragium is ready to receiue the ſhips: the paſſage ouer is 220 miles. Vpon Brundutium bordereth the territory of the Pædiculi. Nine young men there were of them, and as many maids, deſcended from the Illyrians, who begat betweene them thirteen nations. The townes of theſe Pædiculi, be Rhudia, Egnatia, Barion, beſortime Iapyx of *Edalus* his ſonne, who alſo gaue the name to Iapygia. Riuer, Paſtius, and Aufidus iſſuing out of the Hirpine mountaines, and running by Canuſium. Then followes Apulia of the Daunians, ſurnamed ſo of their leader, father in law to *Diomedes*. In which is the towne Salapia, famous for the loue of an harlot that *Anniball* caſt a fancie vnto; then, Sipontum and Vria: alſo the riuer Cerbalus, where the Daunians take their end: the port Agafus, the cape of the mountaine Garganus, from Salentine or Iapygium 234 miles, fetching a compaſſe about Garganus: the hauen Garna, the lake Pantanus. The riuer Frento, full of Baies and Hauens, and Teanum of the Apulians. In like manner alſo, Larinum, Aliturnia, and the riuer Tifernus. Then cometh in the region Frentana. So there be three kindes of nations, Teani, of their leader, from the Greekes: the Lucanes ſubdued by *Calchas*, which quarters now the Atinates hold and occupie. Colonies of the Daunians beſides the abouenamed, Luceria, and Venusia: townes, Canuſium, Arpi, ſometime Argos Hippium, builded by *Diomedes*, but ſoon after called Argyrippa. There *Diomedes* vanquiſhed and deſtroied the whole generation of the Monadians and Dardians, together with two cities, which grew to a merry iſt by way of a by-word, Apina and Trica. The reſt be more inward in the ſecond region, to wit, one Colonie of the Hirpines called Beneuentum, changed into a more luckie name, whereas in times paſt it was cleaped Maleuentum: the Æculanes, Aquilonians, and Abellinates, ſurnamed Protropi: the Campanes, Caudines, and Ligurians, ſurnamed Cornelians: as alſo Bebianes, Veſcellanes, Deculanes, and Aletrines: Abellinates ſurnamed Marſi, the Atranes, Æcanes, Afellanes, Attinates, & Arpanes: the Borcanes, the Collatines, Corinenſes; and famous for the ouerthrow of the Romanes there, the Cannians: the Dirines, the Metintanes, the Genuſines, the Hardonians and Hyrines: the Latrates ſurnamed Frentanes, the matrines, and out of Garganus the Marcolanes, the Neritines, and Natines, the Rubuſtines, the Syluines and Strapellines, the Turmentines, the Vibinates, Venusines, and Vlurtines. Now the Inlanders of the Calabrians, the Ægirines, Apaneſines and Argentines. The Butuntines and Brumbeſtines, the Decians, the Norbanes, the Pations, Sturnines, and Turines. Alſo of Salentine midlanders, the Aletines, Baſterbines, Nere-
tines, Valentines, and Veretines.

CHAP. XII.

¶ The fourth Canton or region of Italy.

Now followeth the fourth region, euen of the moſt hardie and valiant nations of all Italy. In the coaſt of the Frentanes, next to Tifernus, is the riuer Tirinum, full of good hauens and harbours. The towns there, be Hiſtonium, Buca, and Ortona, with the riuer Aternus. More within the country, are the Anxanes ſurnamed Frentanes: the Carentines, both higher and lower, the Lanueneſes; of Marrucines, the Teatines: of Pelignians, the Corſinienſes, Super-Æquani and Sulmonenſes; of Marciants, the Anxantines and Atinates, the Fucentes, Lucentes, and Maruvij: of Albenſes, Alba vpon the lake Fucinus: of Æquiculanes, the Cliternines and Carſcolanes: of Veſtines, the Augulanes, Pinnenſes, Peleuinates, vnto whom are ioined the Auſinates on this ſide the mountaines: of Samnites, whom the Greekes called Sabellians and Saurites, The Colonie Bouianum, the old; and another ſurnamed Vndecumanorum, namely, inhabited by thoſe of the eleuenth legion: the Auſidenates, Eſernines, Fagiſulani, Ficolenſes, Sepi-
nates,

A nates, Treuentinates: of the Sabines, the Amiternines, Curenſes, Forum Decij, Forum Novum, the Fidenates, Interamnates, Nurſines, Nomentanes, Reatines, Trebulanenſes, ſurnamed Mutuſcæi, as alſo Suffenates, the Tiburtes, and Tarinates. In this quarter of the Æquiculæ there be periſhed and gone the Comines, Tadianes, Acedikes, and Alfaterni. *Gellianus* writeth, that Acippe, a towne of the Marſians, builded by *Marſus* a captaine of the Lydians, was drowned and ſwallowed vp by the lake Fucinus. Alſo *Valerian* reporteth, that a towne of the Vidicines in Picenum was vtterly ruined by the Romanes. The Sabines as ſome haue thought were for their religion and deuout worſhipping of the gods called Sevini: they dwell hard by the Veline lakes vpon moiſt and dewie hills. The riuer Nar draineth them dry with his hot waters of brimſtone: which riuer running from thence toward Tyberis filleth it, and gliding from the hill Fiſcellus, neere the groues of Vacuna and Reate, is hidden in the ſame. But from another ſide, the riuer Anio, beginning in the mountain of the Trebanes, bringeth with it into Tiberis three lakes of great name for their delectable pleaſantnes, which gaue the name to Sublaquensu. In the Reatine territorie is the lake Cutiliæ, wherein floteth an Iſland; and this lake, as *M. Varro* ſaith, is in the very midſt and centre of Italy. Beneath the Sabines lieth Latium; on the ſide Picenum; behinde, Vmbria; and the hills of the Apennine on either hand, do incloſe as with a rampier, the Sabines.

CHAP. XIII.

¶ The fifth Region.

C The fiſt region is Picene, a Nation in times paſt moſt populous, 360000 of the Picentes were reduced vnder the proteſtion of the people of Rome. They are deſcended from the Sabines, vpon a vow that they made to hold and ſolemnize a ſacred ſpring. They dwelt by the riuer Aternus, where now is the territorie Adrianus, and the Colonie Adria, ſeven miles from the ſea. There runneth the riuer Vomanum, and there lieth the Prætutiane and Palmenſis territorie: alſo Caſtrum novum, the riuer Batinum, Truentum with the riuer, the onely relique of the Liburnians remaining in Italy. More riuers there be, to wit, Alpulates, Suinum, and Heluinum, at which the Prætutian country endeth, and the Picentian beginneth. The towne Cupra, a caſtle of the Firmanes, and aboue it the colony Aſcum, of all Picenum the moſt renowned. Within ſtandeth Nouana. In the edge or marches without are Cluana, Potentia, and Numana, builded by the Sicilians. Next to thoſe is the colony Ancona, with the promontory Cumeum lying hard vnto it, in the very elbow of the edge thereof as it bendeth, being from Garganus 183 miles. Within-forth do inhabit the Auximates, Beregranes, Cingulanes, Cuprenſes ſurnamed the Mountainers, Falariens, Pauſulanes, Pleninenſes, Ricinenſes, Septempedani, Tolentinates, Triacenſes, the city Salua, and the Tollentines.

CHAP. XIII.

¶ The ſixth Region.

E TO theſe adioyneth the ſixt region, comprehending Vmbria and the French pale about Ariminum. At Ancona begin the French marches, by the name of Togata Gallia. The Sicilians and Liburnians poſſeſſed moſt part of that tract, and principally the territories, Palmenſis, Prætutianus, and Adrianus. Then the Vmbrians expelled: theſe againe Hetruria drane out: and laſtly the Gaules diſſeized it. The people of Vmbria are ſuppoſed of all Italy to be of greateſt antiquity, as whom men thinke to be of the Greekes named Ombri, for that in the generall deluge of the country by raine they only remained alieue. The Tuſcanes are knowne to haue by war forced and woon 300 townes of theirs. At this day in the frontier of it there are the riuer Æſus, and Senogallia; the riuer Metaurus, and the colonie Fanum Fortunæ. Piſaurum alſo with the riuer. In the parts within, Hiſpellum and Tuder. In the reſt, the Amerines, Attidiatres, Aſtricates, Arnates, and Æſinates, Camertes, Caſventillanes, and Carſulanes, Dolates, ſurnamed Salentines, Fulginates, Foro-flaminienſes, Foro-Iulienſes, named alſo Concubienſes, Foro-Bremitian, Foro-Sempronienſes, Iguini, Interamnates, ſurnamed Nartes, Meuanates, Meuanienſes, and Matilicates, Narnienſes, whoſe towne before-time was called Nequinum. Nucernines, ſurnamed Fauonienſes, and Camelani. The Orriculanes, and Oſtranes.

The Pitualnes, with the addition of Pisueris, as also others surnamed Mergentines, and the Pelestines, Sentinates, Sarfinates, Spoletines, Suarranes, Sestimates, and Suillates, Sadinates, Trebiates, Tufcanes, Tifernates, named withal Tribertines, as also other of them distinguished by the name of Metaurense. The Vesonicates, the Vrbinate, as well they that be surnamed Metaurense, as others Hortenses, the Vetricenenses, Vindenates, and Viuentanes. In this tract are extinct the Felignates, and they who possessed Clusiolum about Interamna: also the Saranates, with the towns Acerræ, called besides Vafriæ, and Turceolum, the same that Vetricolum. Semblably the Solinates, Suriates, Fallinates, Apiennates. There are gone also and cleane lost the Aricnates with Crinoulum, also the Vfidicanes and Plangonenses, the Pisinates, and Cælestines. As for Amica about written, *Cato* hath left in record, that it was built 964 yeres before the war against *Perseus*.

CHAP. XV.

¶ The eighth Region.

The eight region is bounded with Ariminum, Padus, and Apennine. In the borders thereof is the river *Crustumium*, the colony Ariminum, with the rivers Ariminum and Aprusa. Then the river Rubico, the utmost limit sometime of Italy. After it Sapis the river, Viris, and Anemo, Rauenna a towne of the Sabines, with the river Bedes, 102 miles from Ancona. And not far from the Vmbrians sea, Butrium. Within forth are these colonies, Bononie, usually called Felsina when it was the head city of Hetruria, Brixillum, Mutina, Parma, Placentia. Towns, Cæfena, Claterni, Forum Clodij, Liuij, and Popilij, pertaining to the Truentines: also [Forum] the Cornelij, Laccini, Fauentini, Fidentini, Otesini, Padinates, Regienfes a Lepido, Solonates: also the forrests Galliani, surnamed Aquinates, Tanetani, Veliates surnamed Vesterri, Regiates and Vmbranates. In this tract the Boij are consumed, who had 112 tribes or kindreds, as *Cato* saith. Likewise the Senones, they that took Rome.

CHAP. XVI.

¶ Of the river Padus.

Padus, issuing out of the bosome of the mountaine Vesulus, bearing vp his head aloft into a mighty height, runs from a marvellous spring worth the seeing, in the marches of the Ligurian Vagienni, and hiding it selfe within a narrow trench as it were vnder the ground and rising vp again in the territory of the Forovibians, is inferiour to no other rivers for excellencie. Of the Greeks it was called Eridanus, and is much spoken of and well knowne, for the punishment of *Phaeton*. It swelth about the rising of the Dog star, by reason the snow is then thawed: more vnruly and rough vnto the fields thereby, than to the vessels vpon it, howbeit it stealeth and carieth away nothing as his owne; but when he hath left the fields, his bountie is more seen by their plenty and fruitfulness: from his head he holdeth on his course 90 miles wanting twain about 300. In which his passage he taketh in vnto him not only the navigable rivers of the Apennine and the Alps, but huge main lakes also that discharge themselves into him: so as in all he carieth with him into the Adriaticke sea to the number of 30 rivers. The chiefe and most notorious of them all are these, sent out of the side of Apennine: Tanarus, Trebia, Placentine, Tarus, Nicea, Gabellus, Scultenna, Rhenus. But running out of the Alps, Stura, Morgus, Duria twaine, Sessites, Ticinus, Lambrus, Addua, Olius, and Mincius. And there is not a river againe that in so little a way groweth to a greater streame: for overcharged it is and troubled with the quantitie of water, and therefore worketh it selfe a deepe channell heauie and hurtfull to the earth vnder it, although it be deriued and drawne into other rivers and goles, betwene Rauenna and Atium, for an hundred and twenty miles; yet because hee belcheth and casteth them out from him in so great abundance, he is said to make 7 seas. Drawn he is to Rauenna by a narrow channel, where he is called Badusa, and in times past Messanicus. But the next mouth that he maketh carieth the bignesse of an haue, which is named Vatrei: at the which *Claudius Cesar* as hee came triumphant out of Britaine entred into Adria with that huge Vessell more like a mighty great house than a Ship. This mouth of it was before, time called Eridanum: of others, Spineticum, of the city Spina neere by, built by *Diomedes*, (as

A (as some thinke) with the treasures of Delphic. There the river Vatreus from out of the territory of Forum Cornelij, encreaseth Padus. The next moneth that it hath, is Caprasia, then Sagis, and so forth Volane, which before time was called Olane. All those rivers and trenches afore said, the Tufcanes began to make first out of Sagis, carrying the forceable streame of the river across into the Atrian meeres, which are called the feuen seas, and made the famous haue of Atria a towne of the Tufcanes, of which the Adriaticke sea tooke the name afore time, which now is called Adriaticum. From thence are the full mouthes there of Carponaria and the Fosse Phylistina which others call Tartarus, but all spring out of the overflowing of the Fosse Phylistina, holpen with Athesis comming out of the Tridentine Alpes, and Togifonus out of the territory of the Padouans: Part of them made also the next port Brundulum: like as the two Medoaci and the Fosse Clodia, make Edron. With these Padus mingleth it selfe, and by these he runneth ouer, and as it is said by most writers, like as in Egypt Nilus maketh that which they call Delta, so it shapeth a triangle figure between the Alpes and the sea coast, two miles in compass. A shame it is to runne to the Greekes for to borrow of them the Etymologie and reason of any thing in Italy: howbeit *Metrodorus Scepsius* saith, That forasmuch as about the spring and head of this river there grow many pitch trees, called in French Padus, therefore it tooke the name Padus. Also, that in the Ligurian language, the river it selfe is called Bodincus, which is as much to say, as bottomlesse. And to approue this reason and argument, there is a towne thereby called Industria, but by an old name Bodincomacum, where in very deed, beginneth the greatest depth thereof.

CHAP. XVII.

¶ Italy beyond Padus, the eleuenth Region.

Next to it, is the region called Transpadana, and the eleuenth in number: all whole in the mid-land part of Italy, into which the seas bring in all things with fruitfull channel. The townes therein, be Vibi, Forum, and Segusta. The colonies at the foot of the Alpes, Augusta of the Taurines, an ancient descent from the Ligurians: from whence Padus is navigable. Then, Augusta Prætoria, of the Salassi, neere vnto the two-fold gullets or passages of the Alpes, to wit, Graia and Peninæ: for men say, that the Carthaginians came through the one, and *Hercules* in at the other, named Graia. There standeth the towne Eporedia, built by the people of Rome, by direction and commandment out of the bookes of *Sibylla*. Now the Gauls in their tongue call good horse-breakers Eporedia. Also, Vercella of the Lybici, descended from the Sallij: Nouaria, from the Vertacomacores: which euen at this very day is a village of the Vocontij, and not as *Cato* thinketh, of the Ligurians: of whom, the Leui and Marici built Ticinum, not far from Padus: like as the Boij comming ouer the Alpes, founded Laus Pompeia; and the Insubrians, Millaine. That Comus and Bergomus, yea and Licini-Forum, with other nations thereabout, were of the Orobians race, *Cato* hath reported: but the first beginning and originall of that nation of Orobians, he confesseth that he knoweth not. Which notwithstanding *Cornelius Alexander* sheweth to haue descended from the Greekes; and this he guesseth by the interpretation of their name, which signifieth, Men liuing in mountaines. In this tract, Barra a towne of the Orobians is cleane destroyed, from whence, *Cato* saith, the Bergomates took their beginning; bewraying euen by their name, that they were seated more highly than happily. There are cleane gone and consumed also the Caturiges, banished persons of the Insubrians: likewise Spina, before named. In like sort, Melpum, a towne of speciall importance for wealth, which (as *Nepos Cornelius* hath written) was by the Insubrians, Doians, and Senones, raised on that very day, on which *Camillus* forced Veij.

CHAP. XVIII.

¶ Venice, the tenth Region.

Now followeth the tenth region of Italy, Venice, lying fast vpon the Adriaticke sea: the river whereof Silis, commeth forth of the mountaines Taurisani: wherein also is the Towne Altinum, the river Liguentia issuing from the mountaines Opitergeni; a haue of the same name: the colonie Concordia. Rivers and hauens, to wit, Romatinum, Tilautum, the

the greater and the lesse: Anassum, whereunto Varranus runneth downe: Alsa, Natifo, with Tur-
 rus, running fast by Aquileia, a colony situate 12 miles from the sea. This is the region of the
 Carni, ioyning vnto that of the Iapides: the riuer Timavus, and the castle Pucinum, so famous
 for good wine. The vale and Firth Tergestinus, taking name of the Coloeie Tergeste, 23 miles
 from Aquileia: beyond which six miles, is the riuer Formio, 189 miles from Rauenna: the an-
 cient bound or limit of Italy enlarged: but at this day of Istria, which was so named of the ri-
 uer Ister, flowing out of the riuer Danubius into Adria: and ouer against the same Ister, the
 gullet or mouth of Padus also entreteth thither: by the contrary rushing streames of which two
 riuers, the sea between both beginneth to be more milde, as many Authors haue reported, but
 vntuly: and *Cornelius Nepos* also, although he dwelt iust by Padus: for there is no riuer that
 runneth out of Danubius into the Adriaticke sea. Deceiued (I suppose) they were because the
 ship Argos went downe a riuer into the Adriaticke sea, not far from Tergeste; but what riuer it
 was, is yet vnkowne. They that will seeme to be more curious than their fellowes, say, That
 it was carried vpon mens shoulders ouer the Alpes: and that it was set into Ister, and so into
 Saus, and then Nauportus (which vpon that occasion tooke his name) which ariseth betweene
 Amona and the Alpes.

CHAP. XIX.

¶ Istria.

Istria runneth out like a demie Island. Some haue deliuered in writing, that it is 40 miles
 broad, and 122 miles about. The like they say of Liburnia adioyning vnto it, and of the hol-
 low gulfie Flanaticus. But others say, that the compasse of Liburnia is 180 miles. And some
 there be againe, who haue set out Iapidia, as far as to the said creeke Flanaticus, behind Istria
 130 miles: and so haue made Liburnia in circuit 150 miles. *Tuditanus*, who subdued the Istri-
 ans, vpon his owne statue there set this inscription; That from Aquileia to the riuer Titius,
 were 200 stadia. The townes in Istria of Romane citizens, be *Aegida* and *Parentium*. A Colony
 there is besides, *Pola*, now called *Pietas Iulia*, built in old time by the Colchians. It is from
 Tergeste 100 miles. Soone after, ye see the towne *Nesactium*, and the riuer *Arfia*, the vtmost
 bound now of Italy. From Ancona to Pola there is a cut ouer the sea of 120 miles. In the mid-
 land part of this tenth region, are these Colonies; *Cremona*, and *Brixia*, in the *Cenomanes*
 countrie: but in the Venetians countrie, *Ateste*. Also the townes, *Acelum*, *Parauium*, *Opitergi-
 um*, *Belunum*, *Vicetia*: *Mantua* of the Tuscans is only left beyond Padus. That the Venetians
 were the off-spring of the Trojanes, *Cato* hath set downe in writing: also, that the *Cenomanes*
 neere vnto *Massiles*, dwell in the Volcians countrie. *Fertines*, *Tridentines*, and *Parnenses*, are
 townes of Rhetia. As for Verona, it is of Rhetians, and Euganeans; but *Iulienses* be of the Car-
 nians. Then follow these, whom we need to vse no curiositie in naming; *Alutruenses*, *Afferi-
 ares*, *Flamonienfes*, *Vannienfes*, & others surnamed *Gulici*: *Foro Iulienfes* surnamed *Transpa-
 dani*: *Forelani*, *Venidates*, *Querqueni*, *Taurisani*, *Togienfes*, *Varuani*. In this tract there be peri-
 shed in the borders, *Itaminum*, *Pellaon*, *Palscium*. Of the Venetians, *Atina*, and *Caelina*: of
 the Carnians, *Segeste* and *Ocra*: and of the Taurisci, *Noreia*. Also from Aquileia 12 miles, there
 was a towne quite destroyed by *M. Claudius Marcellus*, euen maugre the Senate, as *L. Piso* hath
 recorded. In this region there be also ten notable lakes and riuers, either issuing forth of them
 as their children, or else fed and maintained by them, if so be they send them out againe, when
 they haue once receiued them: as *Larius* doth *Aena*, *Verbanus* *Ticinus*, *Benacus* *Mincius*, *Se-
 binus* *Ossius*, *Eupilius* *Lamber*, all inhabiting and seated in Padus. The Alpes reach in length
 ten miles from the vpper sea to the lower, as *Calius* saith: *Timogenes*, two and twenty: but *Corne-
 lius Nepos* draweth them out in breadth an hundred miles: *T. Livius* saith, three thousand stadia:
 both of them take measure in diuers places: for sometime they exceed a hundred miles, where
 they disioyne Germany from Italy, and in other parts they are so thin, that they make not full
 out threescore and ten miles; and that by the prouidence as it were of Nature. The breadth of
 Italy from Varus vnder the foot of them, through the shallowes or plasches of *Sabatia*, the
 Taurines, *Comus*, *Brixia*, *Verona*, *Vicetia*, *Opitergium*, *Aquileia*, *Tergeste*, *Pola*, and *Aristia*,
 maketh seuen hundred and two miles.

CHAP.

CHAP. XX.

¶ Of the Alpes, and Alpine Nations.

Many nations inhabit the Alps, but those of speciall name from Pola to the tract of Ter-
 gestis, are these, the Secuffles, Subocrices, Catili, Menocaleni; and neere to the Carnians
 those who in times past were called Taurisci, but now Norici. Vpon these there do con-
 fine the Rhetians and Vindelici, all diuided into many States. Men thinke that the Rheti are
 the Tuscans progenie, driuen out by the Gauls, with their leader *Rhetus*. But leauing these
 Rhoetians, turning our breast and visage to Italy, wee meet with the Euganean nations of the
 Alpes, who inioyed the liberty and franchises of the Latines, and whose townes *Cato* reckoneth
 to the number of 34. Of them, the Triumpilines, both people and lands were sold. After them
 the Camuni and many such were annexed to the next townships, and did seruice as homagers
 to them. The Lepontians and the Salassians, the same *Cato* thinketh to be of the Taurick race.
 But all others in manner suppose verily that the Lepontians were a residue left behinde of
 Hercules his traine and company, grounding vpon the interpretation of the Greek name, as ha-
 uing their bodies seaged with the Alpine snowes as they passed through: that the Graij like-
 wise were of the same retinue, planted in the very passage, and inhabiting the Alps Graiae: also
 that the Euganei were noblest of birth, whereupon they took their name. The head city of them
 is Stonos. Of those Rhoetians the Vennonetes and Sarunetes, inhabit neere the heads of the ri-
 uer Rhenus. And of the Lepontians, those who are called Viberi, dwell by the Spring of Rhoda-
 nus, in the same quarter of the Alpes. There be also inhabitants within the Alps, endowed with
 the liberty of Latium, namely, the O&odurenses, and their neighbor borderers the Centrones,
 as also the Cottian States. The Caturiges, and those from them descended, to wit, the Vagi-
 enni, Ligures, and such as be called the Mountainers: and many kindes of the Capillati, confin-
 ing vpon the Ligurian sea. It seemeth not amisse in this place to set down an inscription out
 of a triumphant Trophie erected in the Alps, which runneth in this forme: Vnto the Emperour
 Caesar, son of Augustus of famous memorie, Arch-Bishop, Generall foure times, and inuested in the sa-
 cred authoritie of the Tribunes: the Senate and people of Rome. For that by his conduct and happie for-
 tune, all the Alpine nations which reached from the vpper sea to the nether, were reduced and brought vnder
 the Empire of the people of Rome. The Alpine nations subdued, are these, Triumpilini, Camuni, Venno-
 netes, Isarci, Breuni, Nauntes & Focnates. Of the Vindelici foure nations, to wit, the Conuantes, Virucina,
 tes, Licates, and Catenates. The Abisantes, Suanetes, Calucones, Brixentes, and Lepontij. Viberi, Nantuates,
 Seduni, Yeragri, Salaci, Acitauones, Medulli, Vconi, Caturiges, Brigiani, Sugionti, Ebroadunij, Nemaioni,
 Edenates, Esubiani, Veamini, Gallia, Triulatti, Ectini, Vergunium, Egnituri, Nementuri, Oratelli, Nerusi-
 velauni, Suetri. Now there were not reckoned among these the twelue Cottian States which were not vpon
 any hostility, yet those which were assigned to the free townes to enioy the burgoisie of Rome, by vertue
 of the law Pompeia. Behold this is that Italy consecrated to the gods, these are her nations, and
 these be the townes of her seuerall States. And more than all this, that Italy, which when *L. A-
 mylius Paulus* and *Caius Atilius Regulus* were Consuls, vpon newes brought of a sudden rising
 and tumult of the Gauls, alone by it selfe, without any forrein aids, and euen them, without any
 nations beyond Padus, armed 80000 horsemen and 700000 foot. In plenty of all mettall mines
 it giueth place to no land whatsoeuer. But forbidden it is to dig any by an old act of the Senat,
 giuing expresse order to make spare of Italy.

CHAP. XXI.

¶ Illyricum.

The Nation of the Liburnians ioineth vnto Arfia, euen as farre as the riuer Titius. A part
 thereof were the Mentores, Hymani, Enchelex, Dudini, and those whom *Callimachus* na-
 meth Pucetiae. Now, the whole in generall is called by one name, Illyricum. The names
 of the nations are few of them either worthy or easie to be spoken. As for the iudiciall court of
 Assises at Scordona, the Iapides and foureteeen States besides of the Liburians resort vnto. Of
 which it grieueth me not to name the Lacinians, Stulpinians, Burnistes and Albonsenses. And
 in that Court these Nations following haue the libertie of Italians, to wit, the Alutae and
 Flanates.

Flanates, of whom the sea or gulfe beareth the name: Lopsi, Varubarini, and the Affesiates that are exempt from all tributes; also of Islands, the Fulfinates and Curiolæ. Moreover, along the borders and maritime coasts, beyond Nesactum, these townes; Aluona, Flauona, Tarfatica, Senia, Lopfica, Ortopula, Vegium, Argyruntum, Corinium, the city Ænona, the riuier Pausinus, & Tedanium, at which Iapida doth end. The islands lying in that gulfe, together with the townes, besides those towns aboue noted, Abirtium, Arba, Tragurium, Issa, Pharos beforetime Paros, Crexa, Giffa, Fortunata, Again, within the continent, the colony Iaderon, which is from Pola 160 miles. From thence 30 miles off, the island Colentum; and 18, the mouth of the riuier Titius.

CHAP. XXII

¶ Liburnia.

The end of Liburnia and beginning of Dalmatia is Scordona, which frontier towne is 12 miles from the sea, situate vpon the said riuier Titius. Then followeth the antient countrie of the Tariores, and the castle Tario, the Promontory Diomedis, or, as some would haue it the demy island Hyllis, taking in circuit a hundred miles: also Tragurium, inhabited by Roman citizens, well knowne for the marble there: Sicum, into which place, *Claudius* late *Cæsar*, sent the old souldiers: the Colony Salona, 222 miles from Iadera. There repaire to it for law those that are described into Decuries or tithings 382: to wit, Dalmatians 22, Decunum 239, Ditions, 69, and Mezæi 52, Sardiates: in this tract are Burnum, Mandetrium, and Tribulum, castles of name for the battels of the Romanes. There came also forth of the islands the Isthians, Collentines, Separians, and Epetines. Besides them, certaine castles, Piguntia and Rataneum, and Narona a colonie pertaining to the third Countie-court, 72 miles from Salona, lying hard to a riuier of the same name, and 20 miles from the sea. *M. Varro* writeth, that 89 States vsed to repaire thither for iustice. Now, these only in a manner be knowne, to wit, Cerauni in 33 Tithings, Daorizi in 17, Dekitiates in 103, Docleates in 34, Deretines in 14, Deremistes in 30, Dindari in 33, Glinditiones in 44, Melcomani in 24, Naresij in 102, Scirtari in 72, Siculote in 24: and the Vardæi, who sometime wasted and forraied Italy, in 20 decuries and no more. Besides these, there held and possessed this tract Oenei, Partheni, Hemaſini, Arthitæ & Armistæ. From the riuier Naron a hundred miles, is the colony Epidaurum. Townes of Roman citizens be these, Rhizinium, Aſcrinium, Butua, Olchinium, which beforetime was called Colchinium, built by the Colchi. The riuier Drilo, and the towne vpon it, Scodra, inhabited by Roman citizens, eighteen miles from the sea.ouer and besides, many other townes of Greece, yea & strong cities, out of all remembrance. For in that tract were the Labeates, Enderudines, Saffæi, Grabæi, and those who properly were called Illyrij, the Taulantij and Pyreæi. The Promontorie Nymphæum in the coast thereof, keepeth still the name: also Lyſſum a towne of Romane citizens, a hundred miles from Epidaurum.

C XXIII.

¶ Macedonia.

From Lyſſum is the prouince of Macedonia: the nations there, be the Partheni, and on their backe side the Daſſaretæ. Two mountaines of Candauia 79 miles from Dyrrhachium: but in the borders thereof, Denda, a towne of Roman citizens: also the Colonie Epidamnum, which for that vnluckie names sake was by the Romans called Dyrrhachium. The riuier Aous, named of some Æas. Apollonia, sometime a Colonie of the Corinthians, situate within the countrey, ſeuën miles from the sea, in the marches wherof is the famous Nymphæum. The borderers inhabiting thereby, are the Amantes and Buliones. But in the very edge thereof, the town Oricum built by the Colchi. Then beginneth Epirus, the mountaines Acroceraunia, at which we haue bounded this sea of Europe: as for Oricum, it is from Salentinum (a promontorie of Italy) 85 miles.

CHAP. XXIII ¶ Noricum.

Behind the Carni and Iapides, whereas the great riuier Iſter runneth, the Norici ioine to the Rhariti. Their townes be Virunum, Celcia, Teurnia, Aguntum, Viana, Æmora, Claudia, Flavium,

A vium, Tolvenſe. Vpon the Norici there lie fast the Lake Peiſo, the deserts of the Boij. Howbeit, now by the colonie of the late Emperor *Claudius* of famous memorie, Salaria and the towne Scarabantia Iulia, they be inhabited and peopled.

CHAP. XXV.

¶ Pannonia.

Hence beginneth Pannonia so fruitfull in Maſt: whereas the hills of the Alps, waxing more mild and ciuill, turning through the miſt of Illyricum from the North to the South, settle lower by an easie descent both on the right hand and the left. That part which regardeth the Adriatick sea, is called Dalmatia, and Illyricum aboue named. Pannonia bendeth toward the North, and is bounded by the riuier Danubius. In it are these Colonies, Æmonia, Siscia. And these riuers of ſpeciall name, and nauigable, run into Danubius, Draus with more violence out of the Noricke Alps; and Saus out of the Carnicke Alpes more gently, 115 miles between. As for Draus, it paſſeth through the Serretes, Serrapilles, Iafians, & Sandrozetes: but Saus through the Colapians and Bruci. And these be the chiefe States of that countrey. Moreover, the Ariuates, Azali, Amantes, Belgites, Catari, Cornicates, Araviſci, Hercuniates, Latovici, Oſeriates, and Varciani. The mount *Claudius*, in the front whereof are the Scordisci, and vpon the back, the Taurisci. The island in Saus, Metubarris, the biggest of all the riuier islands. Besides, notable good riuers, Calapis running into Saus neere Siscia, where with a double channel it maketh the island called Segeſtica: another riuier Bacuntius, running likewise into Saus, at the towne Sirmium: where is the State of the Sirmians and Amantines. Fiue & forty miles from thence Taurunum, where Saus is intermingled with Danubius. Higher aboue there run into it Valdanus and Vrpanus, and they ywis be no baſe and obſcure riuers.

CHAP. XXVI.

¶ Maſia.

Vnto Pannonia ioineeth the Prouince called Maſia, which extendeth along Danubius vnto Pontus. It beginneth at the confluent aboue named: in it are the Dardaniens, Celegeri, Triballi, Trimachi, Moſi, Thranes, and the Scythians bordering vpon Pontus. Faire riuers, out of the Dardaniens countrey, Margis, Pingus, and Timachis. Out of Rhodope, Oeſſus: out of Hæmus, Vtus, Eſſamus, and Ieterus. Illyricum where it is broadest, taketh vp 325 miles: it lieth out in length from the riuier Arſia to the riuier Drinius, 800 miles. From Drinium to the cape Acroceraunium, 182 miles. *M. Agrippa* hath ſet downe all the whole ſea comprehending Italy and Illyricum, in the compaſſe of 1300 miles. In it are two ſmaller ſeas or gulfs bounded as I haue ſaid: namely, The lower, otherwiſe called the Ionian, in the fore-part: the inner, called Adriaticum, which alſo they name the vpper: in the Auſonian ſea there be no iſlands worth the ſpeaking, but thoſe aboue named: in the Ionian ſea there are but few, to wit, vpon the Calabrian coaſt before Brundiuſum, by the obiect ſite whereof, the haven is made: and againſt the Apulian coaſt Diomede, famous for the tombe and monument of *Diomedes*: another alſo of that name, called by ſome Teutria. As for the coaſt of Illyricum, it is peſtered with more than a thouſand, ſuch is the nature of the ſea, full of ſhelues and waſhes, with narrow chanelles running between. But before the mouthes of Timavus, there be iſlands famous for hot waters, which ebbe and flow with the ſea: and neere vnto the territorie of the Iſtrians, Ciſſa, Pullaria, and thoſe which the Greekes name Abſyrtides, of *Medeus* brother *Abſyrtis* there ſlaine. Neere vnto them, they called the iſlands Eleſtrides, wherein is ingendred Ambre, which they call Eleſtrum, a moſt aſſured argument to proue the vanity of the Greekes; for that which of them they meant, was neuer known: againſt Iader, there is Liſſa; and certain other ouer againſt the Liburnians, called Creteæ: and as many of the Liburnians, Celaduſæ: againſt Surium, there is Brattia, Next to theſe, Coreyra, ſurnamed Melæna, with the towne of the Gnidians, diſtant 22 miles aſunder: between which and Illyricum, is Melita; whereof (as *Callimachus* teſtifieth) the little dogs Melitæi tooke their name: and 12 miles from thence, the three Elaphites. In the Ionian ſea from Oricum 1000 miles, is Saſonis, well knowne for the Pirats harbor there.

THE

THE FOUVRTH BOOKE OF
THE HISTORIE OF NATURE,
WRITTEN BY C. PLINIUS
SECVNDVS.

From whence first arose all the fabulous lyes, and the excellent Learning of the Greekes.

The third Sea of Europe beginneth at the mountaines Acrocerania, and endeth in Hellespont: it containeth besides nineteene smaller gulfes or creekes, 25 thousand miles. Within it, are Epirus, Acarnania, Ætolia, Phocis, Locris, Achaia, Messania, Laconia, Argolis, Megaris, Attica, Bœotia. And againe from another sea the same Phocis and Locris, Doris, Phthiotis, Thesalia, Magnesia, Macedonia, Thracia. All the fabulous weine, and learning of Greece, proceeded out of this quarter. And therefore we will therein stay somewhat the longer. The countrey Epirus, generally so called, beginneth at the mountaines Acrocerania. In it, are first the Chaones, of whom Chaonia taketh the name: then the Thesprotians, and Antigoneses: the place Aornus, and the aire arising out of it so noisome and pestiferous for birds. The Cestines, and Perrhæbians with their mountaine Pindus: the Cassiopes, the Dryopes, Selli, Helopes, and Molossi, among whom is the temple of Iupiter Dodonæus, so famous for the Oracle there: the mountaine Tomarus, renowned by Theopompus for the hundred fountaines about the foot thereof.

CHAP. I.

¶ Epirus.

Epirus it selfe reaching to Magnesia and Macedonia, hath behinde it the Dassaretians about named, a free nation, but anon the sauage people of the Dardani-ans. On the left side of the Dardani-ans, the Trebellians and nations of Mœsia lye ranged: afront there ioine vnto them, the Medi and Denthelates: vpon whom the Thracians border, who reach as farre as to Pontus. Thus enuironed it is and defenced round, partly with the high hill Rhodope, and anon also with Hamus. In the vtmost coast of Epirus among the Acrocerania, is the castle Chimæra, vnder which is the spring of the kings water. The townes are, Mæandria and Cestria: the riuer of Thesprotia, Thyamis: the colonie Buthrotium: and the gulfes of Ambracia, about all others most famous, receiuing at his mouth the wide sea; 39 miles in length, and 15 in breadth. Into it runneth the riuer Acheron, flowing out of Acherusia, a lake of Thesprotia 36 miles from thence: and for the bridge ouer it 1000 foot long, admirable to those that admire and wonder at all things of their owne. In the very gulfes is the towne Ambracia. The riuers of the Molossians, Aphas and Arachthus. The citie Anaetoria, and the lake Pandosia. The townes of Acarnania, called before time Curetus, be Heraclea and Echinus: and in the very entrance and mouth thereof, Artium a Colonie of Augustus, with the goodly temple of Apollo, and the free citie Nicopolis. When ye are gone out of the Ambrecian gulfes into the Ionian sea, yee meet with the Leucadian sea coast, and the promontorie of Leucate. Then the creeke, and Leucadia it selfe, a demie Island, sometime called Neritis, but by the labour of the inhabitants thereby, cut quite from the Continent, but annexed to it again by meanes of the winds blowing together heapes of

A of sand, which place is called Dioryctus, and is in length almost halfe a mile. A town in it there is called Leucas, sometime Neritum. Then the cities of the Acarnanians, Halyzæa, Stratos, Argos surnamed Amphiloichicum. The riuer Achelous running out of Pindus, & diuiding Acarnania from Ætolia, and by continuall bringing in of earth, annexing the island Artemita to the firme and maine land.

CHAP. II.

¶ Ætolia.

The Ætolian nations, be the Athamans, Tymphæi, Ephiri, Ænienfes, Perrhœbi, Dolopes, Maraces and Atraces, from whom the riuer Atrax falleth into the Ionian sea. The Towne Calydon in Ætolia is seuen miles and an halfe from the sea, neere to the riuer Euenus: then followeth Macynia and Molychia, behind which Chalcis standeth, and the mountaine Taphiasus. But in the very edge and borders thereof, the Promontorie Antirrhium, where is the mouth of the Corinthian gulfes, not a mile broad where it runneth in, & diuideth the Ætolians from Peloponnesus. The promontorie that shooteth out against it, is named Rhion: but vpon that Corinthian gulfes are the townes of Ætolia, Naupaetum and Pylene: but in the mid-land parts, Pleucon, Halyarna. The mountaines of name: in Dodone, Tomarus: in Ambracia, Grania: in Acarnania, Aracynthus: in Ætolia, Acanthon, Panætolum and Macinium.

CHAP. III.

¶ Locri.

Next to the Ætolians are the Locri, surnamed Ozolæ, free States and exempt: the towne Oeanthe: the haue of Apollo Phæstus: the creeke Crissaus. Within-forth are these towns, Argyna, Eupalia, Phæstum, and Calamissus. Beyond them are Cithræi, the plaines of Phocis, the towne Cirrha, the haue Chalæon: from which, seuen miles within the land, is the free citie Delphi, vnder the hill Parnassus, the most famous place vpon earth for the Oracle of Apollo. The fountaine Castalius, the riuer Cephissus running before Delphos, which ariseth in a citie, sometime called Lileæa. Moreouer, the towne Crissa, and together with the Bulenses, Anticyra, Naulochum, Pyrrha, Amphissa an exempt State, Trichone, Tritea, Ambrysus, the region Drymæa, named Daulis. Then in the inmost nouke of the creeke, the very canton and angle of Bœotia is washed by the sea, with these townes Siphæ and Thebæ, which are surnamed Corsicæ neere to Helicon. The third towne of Bœotia from this sea is Page, from whence proceedeth and beareth forth the necke or cape of Peloponnesus.

CHAP. IV.

¶ Peloponnesus.

Peloponnesus, called beforetime Apia and Pelasgia, is a demy Island, worthie to come behinde no other land for excellency and name, lying betwene two seas, Ægeum and Ionium: like vnto the leafe of a plane tree, in regard of the indented creekes and cornered nouks thereof: it beareth a circuit of 563 miles, according to Isidorus. The same, if you comprise the creekes and gulfes, addeth almost as much more. The streight where it beginneth to passe on and go forward, is called Isthmos. In which place the seas a bouenamed gushing and breaking from diuers waies, to wit, from the North and the East, do deuoure all the breadth of it there: vntill by the contrary running in of so great seas, the sides on both hands being eaten away, and leauing a space of land betwene, siue miles ouer, Hellas with a narrow necke doth meet with Peloponnesus. The one side thereof is called the Corinthian gulfes, the other, the Saronian. Lecheum of the one hand, and Cenchræa of the other, do bound out and limit the said streights where the ships are to fetch a great compass about with some danger, such vessels I meane as for their bignesse cannot be conueighed ouer vpon wains. For which cause, Demetrius the king, Cæsar the Dictator, prince Caius, and Domitius Nero, assaied to cut through the narrow foreland, and make a channell nauigable with ease: but the attempt and enterprife was vnhappy, as appeared by the issue and end of them all. In the midst of this narrow streight which we

H

haue

haue called Isthmos, the colonie Corinthus, beforetime called Ephyra, scituate hard to a little hill, is inhabited, some 60 stadia from both sea sides: which from the top of the high hill and castle there, which is named Acrocorinthus, wherein is the fountaine Pirene, hath a prospect into both those contrarie seas. At this Corinthian gulfe there is a passage or cut by sea from Leucas to Patrae of 87 miles. Patrae a Colonie, built vpon the promontorie of Peloponnesus, that shooteth farthest into the sea, ouer-against Aetolia and the riuer Euenus, of lesse distance, as hath bin said, than fise miles in the very gullet and enterance, do send out the Corinthian gulfe 85 miles in length, euen as far as Isthmos.

CHAP. V.

¶ Achaia.

Achaia, the name of a prouince, beginneth at Isthmus, aforetime called it was Aegialos, because of the cities, scituate so orderly vpon the strand. The principal and first there is Lechea abouenamed, a port towne of the Corinthians. Next to it Oluros, a castle of the Peleneans. The townes Helice, Bura, and (into which the inhabitants retired themselves, when these beforenamed were drowned in the sea) Sicyon, Aegira, Aegion, and Erineos. Within the country was Cleone and Hyfie. Also the haven Panormus, & Rhium described before: from which promontorie fise miles off standeth Patrae aboue mentioned, & the place called Pherae. of 9 hills in Achaia, Scioessa is most knowne, also the Spring Cymothoe. Beyond Patrae is the towne Olenum, the colonie Dymae. Certain faire places called Buprasium and Hirmene: & the promontorie Araxum. The creeke of Cyllene, the cape Chelonates: from whence to Cyllene is two miles. The castle Phlius. The tract also by Homer named Arethyrea, and afterwards Asopis. Then the country of the Elians, who before were called Epei. As for Elis the city it selfe, it is vp higher in the mid-land parts, 12 miles from Pylos. Within it standeth the Chappell of *Iupiter Olympius*, which for the fame of the games there, containeth the Greekes and Chaldeans account of yeares. Moreover, the town sometime of the Piseans, before which the riuer Alpheus runneth. But in the borders and coast therof the promontorie Isthys. Vpon the riuer Alpheus, there is passage by water in barges to the townes Aulos and Lepreon. The promontory Plataneus; all these lie Westward. But toward the South, the arme of the sea called Cyparissius, and the city Cyparissa, 72 miles in circuit. The townes vpon it, Pylos, Methone, a place and Forrest called Delos: the promontorie Acritas: the creeke Asineus of the towne Asinum, & Coroneus of Corone; and these are limited with Tenarus the promontorie. There also is the region Messenia with 22 mountains. The riuer Paomifus. But within, Messene it selfe, Ithome, Oechalia, Arene, Pteleon, Thyron, Dorion, Zancum, famous townes all for many occurrents at sundry times. The compass of this arme of the sea is 80 miles, the cut ouer-crosse 30 miles. Then from Tenarus, the Laconian land pertaining to a free people, and an arme of the sea there in circuit about 206 miles, but 39 miles ouer. The townes Tenarum, Amiclae, Pherae, Leuctra, and within-forth Sparta, Theranicum: and where stood Cardamyle, Pitane, and Anthane. The place Thyrea, and Gerania. The hill Taygetus: the riuer Eurotas, the creeke Aegylodes, and the towne Psammathus. The gulfe Gytheates, of a towne thereby (Gytheum) from whence to the Island Crete, there is a most direct and sure cut: all these are inclosed within the promontorie Maleum. The arme of the sea next following is called Argolicus, and is 50 miles ouer, and 172 miles about. The towns about it Boea, Epidaurus, Limera, named also Zarax. Cyphanta, the haven. Riuer, Inachus, Erasinus: betweene which standeth Argos surnamed Hippium vpon the Lake Lerne, from the sea two miles, and nine miles farther Mycenae: also where they say Tiryntha stood, and the place Mantinea. Hills, Artemius, Apefantus, Asterion, Parparus, and eleuen others besides. Fountaines, Niobe, Amymon, Psammothoe. From Scylleum to Isthmus 177 miles. Towns, Hermione, Troezen, Coryphasium and Argos, called of some Inachium; of others, Dipsum. The haven Cenites, the creeke Saronicus, beset round about in old time with woods of Oake, whereupon it had the name, for so old Greece called an Oake. Within it stood the towne Epidaurum, much resorted vnto for the temple of *Aesculapius*, the promontorie Spiraenum, the hauens Anthedon, and Bucephalus: and likewise Cenchea which we spake of before, being the other limit of Isthmus, together with the chappell of *Neptune*, famous for the games there represented euery fise yerres. Thus many creekes doth scorch and cut Peloponnesus: thus many

A many seas I say do rore and dash against it. For on the North side the Ionian sea breaketh in: on the West it is beaten vpon with the Sicilian. From the South the Cretian sea driueth against it: Aegium from the Southeast, and Myrtoum on the Northeast, which beginning at the Megarian gulfe, washeth all Attica.

CHAP. VI.

¶ of Arcadia.

The midland parts thereof, Arcadia most of all taketh vp, being euery way far remote from the sea: at the beginning it was named Drymodis, but soone after Pelasgis. The towns in it be Psophis, Mantinea, Stymphalum, Tegea, Antegonea, Orchomenum, Pheneum, Palatium, from whence the mount Palatium at Rome tooke the name. Megalepolis, Catina, Bocallium, Carmon, Parrhasia, Thelphusa, Melanæa, Heræa, Pile, Pellana, Agræ, Epium, Cynætha, Lepreon of Arcadia, Parthenium, Alea, Methydrium, Enepe, Macistum, Lampe, Clitorium, Cleone: betweene which townes is the tract Nemea, vsually called Berubinadia. Mountains in Arcadia, Pholoe with a towne so named. Item, Hyllene, Lyceus, wherein was the chappell of *Iupiter Lyceus*, Mænalus, Artemisus, Parthenians, Lampeus, and Nonacris: & eight besides of base account. Riuer, Lado, issuing out of the meeres and fens of Pheneus, Erymanthus out of a mountaine of the same name, running both downe into Alpheus. The rest of the cities to be named in Achæa, Aliphiræi, Abeatæ, Pyrgenses, Pareatæ, Paragenitia, Tortuni, Typanæi, Thryasii, Tritenses. All Achæa generally throughout, *Domitius Nero* endowed with freedom. Peloponnesus from the promontorie of Malea to the towne Lechaum vpon the Corinthian gulfe, lyeth in bredth 160 miles: but ouer crosse from Elis to Epidaurum 125 miles: from Olympia to Argos through Arcadia 63 miles. From the same place to Phlius is the said measure. And all throughout, as if Nature made recompence for the irruptions of the seas, it riseth vp in 76 hills.

CHAP. VII.

¶ Greece and Attica.

At the streights of Isthmus beginneth Hellas, of our countrymen called Græcia: the first tract thereof is Attica, in old time named Acte. It reacheth vnto Isthmus on that part thereof which is called Megaris of the colony Megara, or against Pagæ. These 2 townes as Peloponnesus lieth out in length, are seated on either hand, as it were vpon the shoulders of Hellas. The Pageans, and more than so, the Aegosthenienfes lie annexed to the Magarensians, and owe seruice to them. In the coast therof is the haven Schoenus. Townes, Sidus, Cremyon, Scironia rocks for three miles long, Geranea, Megara, and Eleusin. There were besides, Oenoe and Probalinthus, which now are not to be seen, 52 myles from Isthmus. Pyraeus and Phalera, two hauens ioined to Athens by a wall, within the land fise miles. A free citie this is, and needeth no more any mans praise: so noble and famous it is otherwise, beyond all measure. In Attica be these fountaines, Cephissia, Larine, Callirhoe, and Enneacreunos. Mountains, Brilessus, Megalcus, Icarus, Hymettus, & Lyrabetus: also the riuer Ilissos. From Pyraeum 42 miles off, is the promontorie Sunium, likewise the promontorie Doriscum. Also Potamos and Brauron, townes in times past. The village Rhamnus, and the place Marathon, the plain Thriaftius, the town Melita and Oropus, in the confines or marches of Boeotia. Vnto which belong Anthedon, Onchestos, Thepre a free town Lebadea: and Thebes surnamed Boeotia, not inferior in fame and renown to Athens, as being the native country, & as men would haue it, of two gods, *Liber* and *Hercules*. Also they attribute the birth of the Muses in the wood Helicon. To this Thebes, is assigned the forest Cithæron, and the riuer Ismenus. Moreover fountaines in Boeotia, Oedipodium, Psammate, Dirce, Epigranea, Arethusa, Hippocrene, Aganippe, and Gargaphia. Mountains ouer and besides the forenamed, Mycalestus, Adylisus, Acontius. The rest of the towns betweene Megara & Thebes, Eleuthera, Haliartus, Platea, Pheræ, Aspledon, Hyle, Thisbe, Erythrae, Glissas, and Copæ. Neere to the riuer Cephissus, Lamia, and Anichia: Medeon, Phligone, Grephis, Coronæa, Charonia. But in the outward borders, beneath Thebes, Ocale, Elæon, Scolos, Scænos, Pteleon, Hyrie, Mycalestus, Hyrecon, Pteleon, Olyros, Tanagia, a free State; and in the

the very mouth of Euripus, which the Island Eubœa maketh by the opposite site thereof, Aulis, so renowned for the large haven that it hath. The Boeotians in old time were named Hyantes. The Locrians also are named withall Epiclemidij, in times past Letegetes, through whom the riuer Cephissus runneth into the sea. Townes, Opus (whereof commeth the gulfe Opuntinus) and Cynus. Vpon the sea coast of Phocis, one & no more, to wit Daphnus. Within forth among the Locrians, Elatæ, and vpon the bank of Cephissus (as we haue said) Lilea: & toward Delphos, Cnenius and Hiampolis: again, the marches of Locri, wherein stand Larymna and Thronium, neere vnto which the riuer Boagrius falleth into the sea. Townes, Narycion, Alope, Scarphia: after this, the vale called of the people there dwelling, Maliacus Sinus, wherein bee these townes, Halcyone, Econia, and Phalara. Then Doris, wherein are Sperchios, Erineon, Boion, Pindus, Cytinum. On the back-side of Doris is the mountain Oeta. Then followeth Æmonia that so often hath changed name. For one and the same hath bin called Pelagicum, Argos, and Hellas, Thessalia also, and Dryopis, and euermore tooke name of the kings. In it was borne a king called *Græcus*, of whom Greece bare the name: there also was *Hellen* borne, from whence came the Hellenes. These being but one people, *Homer* hath giuen three names vnto, that is to say, Myrmidones, Hellenes, and Achæi. Of these, they be called Phthiotæ who inhabit Doris. Their towns be Echinus, in the very gullet & entrance of the riuer Sperchius: and the streights of Thermopylæ, so named by reason of the waters: and foure miles from thence Heraclea, was called Trachin. There is the hill Callidromus: and the famous townes, Hellas, Halos, Lamia, Phthia, and Arne.

CHAP. VIII.

¶ Thessalie.

Moreover in Thessalie, Orchomenus, called before-time Minyeus, and the towne Almon, or after some Elmon, Atrax, Pelinna, and the fountaine Hyperia. Townes, Pheræ, behind which Pierius stretcheth forth to Macedonie: Larissa, Gomphi, Thebes of Thessalie, the wood Pteleon, and the creeke Pagaficus. The towne Pagasa, the same named afterwards Demetrias; Tricca, the Pharsalian plains with a free city; Cranon and Iletia. Mountains of Phthiotis, Nymphæus, most faire and slightly for the naturall arbors and garden works there: Buzigæus, Donacefa, Bermius, Daphissa, Chimerion, Athamas, Stephane. In Thessaly there be 34, whereof the most famous are, Cerceti, Olympus, Pierus, Ossa: iust against which, is Pyndus and Othrys, the seat and habitation of the Lapithæ; and those lie toward the West: but Eastward, Pelios, all of them bending in manner of a theatre: and before them stand raunged wedge-wise, 72 cities, Riueres of Thessalie, Apidanus, Phoenix, Enipeus, Onochomus, Pamisus: the fountain Messeis, the people Boebeiis: and about all the rest the most famous riuer Peneus, which arising neere Gomphi, runneth for 500 stadia in a wooddie dale between Ossa and Olympus, and halfe that way is nauigable. In this course of his, are the places called Tempe, 5 miles in length, and almost an acre and a halfe broad, where on both hands the hills arise by a gentle ascent about the reach of mans sight. Within forth glideth Peneus by, in a fresh green groue, cleare as chrystall glasse ouer the grauelly stones, pleasant to behold for the grasse vpon the banks, and resounding again with the melodious consent of the birds. It taketh in the riuer Eurotus, but entertaineth him not, but as he floweth ouer the top of him like oile (as *Homer* saith:) within a while after that he hath carried him a small way, letteth him goe againe and rejecteth him, as refusing to mingle with his owne siluer streams, those poenall and cursed waters engendred for the infernall Furies of hell.

CHAP. IX.

¶ Magnesia.

To Thessaly, Magnesia is annexed: the fountaine there is Libethra. The townes, Iolchos, Hirmenium, Pyrrha, Methone, Olizon. The promontorie Sepias. Townes moreover, Castana, Sphalattæ, and the promontory Ænantium. Towns besides, Melibœa, Rhifus, Erymne. The mouth of Peneus. Towns, Homolium, Orthe, Thespiæ, Phalanna, Thaumacie, Gyrtion, Cranon, Acarne, Dorion, Melitæa, Phylace, Potinæ. The length of Epirus, Achæia, Attica and Thessalie, lying straight out, is by report 480 miles; the breadth 287.

CHAP.

CHAP. X.

¶ Macedonie.

Macedonie, so called afterwards (for before-time it was named Emathia) is a kingdome consisting of 150 feuerall States, renowned for two kings about the rest, and ennobled sometime for the Monarchie and Empire of the world. This countrie lying farre in behind Magnesia and Thessaly toward the nations of Epirus Westward, is much troubled and infested with the Dardanians. The North parts therof are defended by Pæonia and Pelagoia, against the Triballi. The townes be these, Aege, wherein the maner was to interre their kings: Berœa, and Æginium, in that quarter which of the Wood is called Picria. In the outward borders Heraclea, and the riuer Apilas: more townes, Phina, and Oloros: the riuer Haliacmon. Within forth are the Halorita, the Vallei, Phylacei, Cyrrestæ, Tyriffæi: Pella the Colonie: the town Stobi of Romane citizens. Anon, Antigonæ, Europus vpon the riuer Axios, and another of the same name through which Rhædias runneth: Heordeæ, Scydra, Mieza, Gordinia. Soone after in the borders, Ichna, and the riuer Axios. To this bound the Dardani: Treres, and Pieres border vpon Macedony. From this riuer, are the nations of Pæonia, Parorei, Heordenes, Almopij, Pelagones, and Mygdones. The mountaines Rhodope, Scopius, and Orbelus. The rest is a plaine countrie, wherein Nature seemes to set out her riches: in the lap whereof are the Arethusij, Antiochenses, Idomenenses, Doberienenses, Trienses, Allantenses, Andaristenses, Moryllij, Garefci, Lyncestæ, Othriencei, and the free states of the Amanrines and Orestæ. Colonies, Bulledenis & Dienis. Xilopolitæ, Scotuffæi free; Heraclea, Sintica, Timphæi, and Coronei. In the coast of the Macedonian sea, the towne Calafra, and within forth, Phileros, and Lete: and in the middle bending of the coast, Thessalonica, of free estate and condition. To it from Dyrrachium, it is 114 miles, Therma. Vpon the gulfe Thermaicus, be these townes, Dicæa, Pydna, Derrha, Scione: the promontory Canastæum. Townes, Pallene, Pherga. In which region these mountaines, Hypfizorus, Epirus, Alchione, Leuomne. Townes, Nissos, Brygion, Eleon, Mendæ, and in the Isthmos of Pallene, the Colonie sometime called Potidæa, and now Cassandria, Anthemus, Holophyxus the creeke, and Mecyberna. Townes, Phiscella, Ampelos, Torone, and Singos: the Frith (where *Xerxes* king of the Persians cut the hill Athos from the Continent) in length a mile and a halfe. The mountaine it selfe shooteth out from the plaine into the sea, 75 miles. The compass of the foot thereof takes 150 miles. A towne there was in the pitch of it, Acroton. Now there be Vranopolis, Palæotrium, Thyssus, Cleone, Apollonia, the inhabitants whereof be named Macrobij. The towne Cassera, and a second gullet or creeke of the Isthmus, Acanthus, Stagira, Sitone, Heraclea, and the region lying vnder Mygdonia, wherein are seated farre out from the sea, Apollonia and Arethusa, againe in the coast, Posidium, and a creeke with the towne Cermorus: Amphipolis a free state, and the people Bifaltæ. Then the riuer Strimon, which is the bound of Macedonia, which springeth in Hæmus: of which this is worthy to be remembred, that it runneth into seuen lakes before it keepeth a direct course. This is that Macedonie, which sometime conquered the dominion ouer all the earth: this ouer-ran Asia, Armenia, Iberia, Albania, Cappadocia, Syria and Ægypt; yea and passed ouer Taurus and Caucasus: this ruled ouer the Bastrians, Medians, and Persians, and possessed all the East: this hauing the conquest of India, raunged after the tracts of Father *Liber* and *Hercules*. This is the very same Macedonie, of which in one day *Paulus* *Emilius* our Generall, sacked and sold 72 cities. See the difference of fortune in two men.

CHAP. XI.

¶ Thracia.

Now followeth Thracia, among the most valiant nations of Europe, diuided into 52 regiments of souldiers. Of those States in it, the Denefletes and Medi, whom it grieues me not to name, doe inhabit neere to the riuer Strymon on the right side, as farre as to the Bifaltæ about named: on the left, the Digeri, and many townes of the Bessi, euen to the riuer Nestus, which inuironeth the bottome of the hill Pangæus, between the Eleti, Diobesi, and Carbilesi, and so forward to the Bryse and Capæi. Odomanta a towne of the Odrysians, fendeth

deth out the riuer Hebrus to the neighbour-borderers, the Carbiletes, Pyrogeris, Drugeris, Cæ-
 nicks, Hypsalts, Beni, Corpilli, Boræi, and Edons. In the same tract the Sellætæ, Priautæ, Di-
 lonæ, Thyni, Celctæ, the greater vnder Hæmus, the lesse vnder Rhodope: between whom, run-
 neth the riuer Hebrus. The towne scituat beneath Rhodope, was before-time named Ponero-
 polis; soone after by the founder, Philippopolis: but now of the site thereof Trimontium. The
 ascent of Hæmus vp to the top, taketh six miles: the backe-side and hanging thereof downe to
 Ister, the Mæfians, Getes, Aoti, Gaudæ, and Clariæ, and vnder them the Arræi, Sarmata whom
 they call Areatæ, and Scythians: and about the sea coast of Pontus, the Moriscenes and Sitho-
 nians, from whom the Poet *Orpheus* descended, doe inhadite. Thus Ister boundeth it on the
 North: in the East, Pontus and Propontus: Southward, the sea Ægæum, in the coast whereof
 from Strimon, stand Apollonia, Oestima, Neapolis, and Polis. Within-forth, the Colonie of
 Philip, and 325 miles from Dyrrachium, Scotusa, Topiris, and the mouth of the riuer Nestus.
 The hill Pangæus, Heraclea, Olynthos Abdera a free citie, the meere and nation of the Bisons.
 There, stood the town Tinda, terrible for the horses of *Diomedes* that stabled there. Now at this
 day, Diceæ, Ismaron, the place Parthenion, Phalesina, Maronea called Ortageura before-time.
 The mountaine Serrium and Zonæ: then, the plaine Doriscus able to receiue * 10000 men: for
 so *Xerxes* took a iust account of his armie and numbred it. The mouth of Hebrus: the haue of
 Stentor: the free towne Aenea, together with the tombe of *Polydorus*, the region sometime of
 the Cicones. From Doriscus, the coast bendeth crookedly to Macron-Tichos, for 122 miles.
 About which place the riuer Melas, whereof the creeke beareth name. Townes, Cypfella, Bi-
 fanthe, and that which is called Macron-Tichos, what way as stretching forth the walls along
 from Propontis to the Creeke Melanes betweene two seas, it excludes Chersonesus as it run-
 neth out. For, Thracia of one side beginning at the sea coast of Pontus, where the riuer Ister is
 discharged & swallowed vp, hath in that quarter passing faire and beautifull cities, to wit, Ithro-
 polis of the Milesians, Tomi, and Calatis which before was called Acernetis. It had sometime
 Heraclea and Bizon, which funke and was lost in a gaping chinke of the earth; but now in stead
 thereof Dionysopolis, called before Crunos. The riuer Ziras runneth hard by it. All that tract,
 the Scythians named besides Arotres, possessed. There townes were, Aphrodisius, Libistis,
 Zigerc, Borcobe, Eumenia, Parthenopolis, Gerania, where it is reported that the nation of the
 Pygmæans kept, whom the barbarous people call Catizi, and they are of beliefe that they were
 chased away and put to flight by cranes. In the edge thereof next to Dionysopolis, there is O-
 deffus of the Milesians, the riuer Pomiscus, the towne Tetranaulocos: is the mountaine Hæmus
 bearing forth with a huge top into Pontus had in the pitch thereof the towne Aristæum. Now
 in the coast is Mesembria and Anchialum, where Messa was. The region Astice. There was the
 towne Anthium, now there is Apollonia. The riuers Panissa, Rira, Tæarus, Orofines. Townes,
 Thynnias, Almedeffos, Deuelton with the poole which now is called Deultum, belonging to
 the old souldiers. Phinopolis, neere vnto which is Bosphorus. From the mouth of Ister to the
 entrance of Pontus, some haue made it 555 miles. *Agrippa* hath set to 40 miles more. And from
 thence to the wall about named 150: and so from it to Chersonesus 126. But neere to Bospho-
 rus is the arme of the sea Gathenes. The haue surnamed of old men, and another likewise of
 women. The promontory Chrysoceras, whereupon standeth the town Bizantium of free estate,
 called before-time Lygos. From Dyrrachium it is 711 miles. Thus much lies out the main in
 length between the Adriatick sea and Propontis. Riuers, Bathynias, Pydaras, or Atyras. Towns,
 Selymbria, Perinthus, annexed to the Continent 200 pases broad. Within-forth, Byzia, the
 castle of Thracian kings, hated of Swallows, vpon the horrible and cursed fact of *Tereus*. The
 region Camica: the colonie Flauopolis, where before-time the town was called Zela. And 50
 miles from Byria the Colony Apros, which is from Philippi 188 miles. But in the borders, the
 riuer Erginus, where was the town Gonos. And there you leaue the citie Lyfimachia, also now
 in Chersonesus. For another land passage or Isthmus there is of like streightnes, al one in name,
 and of equall breadth with that of Corinth. Likewise on both sides two cities do beautifie and
 set out the stronds, which they take vp not vnlike to the other, to wit, Padia from Propontis
 and Cardia from the gulfe Melane: as for this, it taketh the name of the forme and proportion
 of the place made like a heart: and both, afterwards, where inclosed within Lyfimachia 3 miles
 from the * long walls abovesaid. Chersonesus from Propontis side, had Tiristasis & Crithotes,
 also Cissa fast vpon the riuer Ægos: now it hath from the colony Apros 32 miles Resistos, ouer-
 against

* Or 100000.

* Macron-
Tichos.

- A against the colony Pariana. And Hellespontus, diuiding Europe from Asia, seuē stadia asui-
 der (as we haue said) hath foure cities there opposite one against another, to wit, in Europe,
 Calippolis and Sestos; in Asia, Lampficum and Abydos. Then, is the promontory of Cherso-
 nesus Mastia, iust contrary to Sigeum, in the crooked front whereof is Cynossema: for so is
Hecubaes tombe named, the very rode of the Athenians nauie. The towne and chappell of *Prote-
 flaus*: and in the very vmoost forefront of Cherronesus, which is called Æbolum, the towne
 Elæus. After it, as a man goeth to the gulfe Melane, the hauens Cælos, Panhormus, and the a-
 boue-named Cardia. The third sea of Europe, is in this manner bounded and limited. Moun-
 taines of Thracia ouer and about those afore rehearsed, Edonus, Gigemorus, Meritus, and Me-
 lamphyllon. Riuers falling into Hebrus, be Bargus, and Suemus. The length of Macedonie,
 Thracia and Hellespontus, is set downe before. Some make it seuē hundred and twenty miles.
 B The breadth is three hundred and eighty miles. The sea Ægium rooke that name of a rocke,
 betweene Tenedos and Chios, more truly than of an Island named Aex, resembling a goat, and
 therefore so called of the Greekes; which all at once appeareth to rise out of the mids of the
 sea. The sea-men that faile from out of Achaia to Andros, discover it on the right hand, and to
 them it presageth some dreadfull and mischieuous accident. Part of the Ægean sea is laid to
 the Myrtoum, and so called it is of a little Island, which sheweth it selfe to them that set saile
 from Gereffus to Macedonie, not farre from Charitlos in Eubœa. The Romanes comprehend
 all these seas in two names: namely, Macedonicum, all that which toucheth Macedonia and
 Thracia: and Græcienum where it beateth vpon Greece. As for the Greekes, they diuide euen
 the Ionian sea into Siculum and Creticum, of the Islands. Also Icarus they call that between
 Samos and Mycione. All the other names are giuen by gulfs and creekes, whereof we haue
 spoken. And thus much verily as touching the seas and nations contained in this manner with-
 in the third section or gulfe of Europe.

CHAP. XII.

¶ The Islands betweene those lands, among which, Creta, Eubœa, Cyclades,
 and Sporades: also of Hellespont, Pontus, Maotis, Da-
 cia, Sarmatia and Scythia.

- D Islands ouer against Threspotia, Corcyra: 12 miles from Buthrotus, and the same from the
 cliffes Acrocerania 50 miles, with a citie of the same name, Corcyra of free condition, also
 the towne Cassiope, and the temple of *Iupiter Cassiopeus*: it lieth out in length 97 miles. *Homer*
 called it Scheria and Phæacia: *Callimachus* also, Drepane. About it are some others: but ben-
 ding toward Italy, Thoronos: and toward Leucadia the two Paxæ, five miles diuided from
 Corcyra. And not farre from them before Corcyra, Ericusa, Marate, Elaphusa, Malthace, Tra-
 chia, Pytionia, Prychia, Tarachie. And from Pholachrum a promontory of Corcyra, the rocke
 into which their goeth a tale, that the ship of *Ulysses* was turned, for the resemblance it hath of
 such a thing. Before Leucadia, Sybota. But between it & Achaia there be very many: of which
 Teleboides the same that Taphia: but of the inhabitants before Leucadia, they be called Ta-
 phias, Oxie, and Prinoessa: and before Ætolia, the Echinades, Ægialia, Cotonis, Thyatira, Geo-
 aris, Dionysia, Cyrtus, Chalcis, Pinara & Myrtus. Before them in the deep sea, Cephalenia and
 Zacynthus, both free states: Ithaca, Dulichium, Same, Crocylea, and Paxos. Cephalenia some-
 time called Melæna, is 11 miles off, and 44 miles about. As for Same, it was destroyed by the
 Romanes: owbeit, still it hath three townes: between it and Achaia is Zacynthus with a town,
 a stately Island, & passing fertile. In times past it was called Hyrie, and is 22 miles distant from
 the South coast of Cephalenia. The famous hill Elarus is there. The Isle it self is in circuit 25
 miles. Twelue miles from it is Ithaca, wherein stands the mountain Neritus. And in the whole
 it takes vp the compasse of 25 miles. From it 12 miles off is Araxum a cape of Peloponnesus.
 Before this Island in the maine sea there appeare Asteris and Prote, before Zacynthus 35 miles
 full East, are the two Strophades, called by others Plotæ: and before Cephalenia, Leroia. Be-
 fore Pylos three Sphagie, and as many before Messene, called, Oenusse. In the gulfe Alineus
 three Thyrides: in the Laconian gulfe, Teganusa, Cothon, Cythera with the towne, named be-
 foretime Porphyris. This lies five miles from the promontorie Malea, dangerous for ships to
 come about it, by reason of the streights there, in the Argolick sea are Pityusa, Irine & Ephyre
 and

and against the territory Hermonium, Typareus, Epiropia, Colonis, Aristera: ouer against Troezenium Calauria, halfe a mile from Platea: also, Belbina, Lacia and Baucidias. Against Epidaurus, Cecryphalos, and Pytioneos, six miles from the Continent. Next to it is Ægina a free state, 17 miles off, and for 20 miles they saile by it. The same is distant from Pyraeum the port of the Athenians, 12 miles, and beforetime was vsually called Oenone. Against the promontory Spiræum, there lie onposite Eleusa, Dendros, two Craugia, two Cæcia, Selachusa, Cencreis and Aspis. Also in the Megarian gulfe, there be foure Methurides. As for Ægilia, it is 15 miles from Cythera, and the same is from Phalaferna a towne in Creet 25 miles. And Creet it selfe, lying of one side to the South, and the other to the North, stretcheth forth in length East and West; a famous and noble Island for a hundred cities in it. *Dosiades* saith it tooke that name of the nymph *Creta* daughter of *Hesperis*: but according to *Anaximander*, of a king of the Curetes. *Philistides*, *Mallotes*, *Cyates*, haue thought it was called first *Æria*, and afterwards *Curetis*: and some haue thought it was named *Macaros* for the blessed temperature of the aire. In bredth it exceedeth in no place 50 miles, and in the middle part broadest it is: but in length it is full 270 miles: in circuit 589 miles: and winding it selfe into the Creticke sea, so called of it, where it stretcheth out farthest Eastward, it puts forth of it the promontory Samonium iust against Rhodos, and Westward Criu-Metopon, toward Cyrenæ. The principall townes of marke, be Phalaferne, Elæa, Cyfamum, Pergamum, Cydon, Minoum, Apteron, Pantomatrium, Amphymalla, Rhythimna, Panhormum, Cyteum, Apollonia, Matium, Heraclea, Miletos, Ampelos, Hyera-pytina, Lebena, Hierapolis. And in the midland parts, Cortyna, Phæstum, Gnosus, Potyrrhenium, Myrina, Lycastus, Rhamnus, Lyctus, Diu, Asum, Pyloros, Rhytion, Clatos, Phæx. Holopyxos, Lasos, Eleutherna, Therapne, Marathusa, Mytinos. And other townes about the number of 60, stand yet vpon record. The hills be Cadiscus, Idæus, Dictæus, and Morycus. The Isle it selfe, from the promontory in it called Criu-Metopon, as *Agrippa* reports, is distant from Phycus, a promontory of the Cyrene 225 miles. Likewise from Capesum point, it is from Malca in Peloponnesus 80 miles. From the Island Carpathus, which lies Westward from the cape Sammonia, 60 miles. This Island aforesaid lyeth between it and Rhodos. The rest about it be these: before Peloponnesus two Coricæ, and as many Mylæ: and on the North side, when a man hath Creet on the right hand, there appeares Leuce iust against Cydonia, together with the two Budoræ, against Matium, Cia: against the promontory Itanum Onisa and Leuce: against Hierapytna, Chrysa, and Caudos. In the same coast are Ophiussa, Butoa, and Rhamnus: and when men haue fetched about and doubled the point Criu-Metopon, K appeare the Isles called Musagores. Before the promontory Sammonium, Phocæ, Platia, Sironides, Naulochos, Armedon and Zephire. But in Hellas, yet still in Ægium, Lichades, Scarphia, Marefa, Phocaria, and very many more ouer against Attica, but townelless, and therefore obscure and of no reckoning: but against Eleusin, the noble Salamis, and before it Psytalia: and from Sunium, Helene fise miles off: and Ceos from thence as many, which our countymen haue named Cæa: but the Greekes Hydrussa, cut off and dismembred from Eubœa. In times past it was 500 stadia long: but soone after, foure parts almost, namely those that butted vpon Bœotia, eaten vp by the same sea: so as now the towne remaining that it hath, be Iulis and Carthæa. For Coreffus and Pæcessa are perished & gone. From hence as *Varro* saith, came the fine linen cloath that women vse: yea, and Eubœa it selfe hath been plucked from Bœotia, and di- L uided with so little an arme running betwene, that a dridge ioineth the one to the other: euidēt it is to the eie, and well seen, by reason of two promontories in the South side, to wit, Genestum, bending toward Attica, and Capharens to Hellespontus: and one vpon the North-side, to wit, Cæneus. In no part thereof doth it extend broader than 40 miles: and no where doth it gather in narrower than 20. But in length from Attica as far as Thessalie, it lies along Bœotia 150 miles: and containeth in circuit 365. From Hellespont, on Caphareus side, it is 225 miles. In times past renowned it was for these cities, Pyrrha, Porthmos, Nefos, Cerinthus, Oreum, Diu, Ædepsum, Ocha, Oechalia, now Chalcis, ouer against which stands Aulis in the main: but now, for Gereftum, Eretria, Carystus, Oritanum, Artemisium, the fountain Arethusa, the riuer Lelantum, the hot waters called Hellopia, it is of great name: but yet in more request for the marble of Carystus. In former time it was called commonly Chalcodontis or Macris, as *Dio- M nyfius* and *Ephorus* doe say: but Macra, according to *Aristides*: and as *Callidemus* would haue it, Chalcis, for the brasse there first found: and as *Menæmus* saith, Abantia: and last of all Afo-
pis,

A pis, as the Poets commonly name it. Without in the Myrtoum sea be many Isles, but of grea-
test marke be Glauconensis and Ægilia: and neere to the promontory Gereftum about Delos
certain lying round together, whereupon they tooke their name Cyclades. The first and chiefe
of them, Andrus with a towne, is from Gereftum 10 miles, and from Ceum 39. *Myrsilus* saith it
was called Caros, and afterwards Antandros. *Callimachus* nameth it Lasia: others Nonagria,
Hydrussa and Epagris: it takes in compasse 93 miles. A mile from the same Andros, and 15
from Delos, lieth Tenos, with a town fifteen miles in length: which for the plenty of water *A-
ristotle* saith was called Hydrussa, but others name it Ophiussa. The rest be these, Myconos
with the hill Dimastus, 15 miles from Delos. Scyros Syphnus, before-time named Heropia
and Acis, in circuit 28 miles about: Seriphus 12 miles, Præpesinthus, Cyrrhus, and Delos it
selfe, of all others most excellent by far, as being the midst of all the Cyclades, much frequen-
B ted for the temple of *Apollo*, and for merchandise and trafique. Which hauing a long time flo-
ted vp and downe, as it is reported, was the only Island that neuer felt earthquake vnto the time
of *M. Varro*. *Mutianus* hath recorded that it was twice shaken. *Aristotle* giueth a reason of the
name in this sort, because it was discovered and appeared on a sudden. *Æglossenes* termeth it
Cynthia: others Otygia, Aferia, Lagia, Chlamydia, Cynethus, and Pyrpile, for that in it fire
was first found out. It is but 5 miles about, and riseth vp by the ascent of the hill Cinthus. Next
it is Rhene, which *Anticlidus* called Celadussa, and *Helladius* Artemite. Moreover, Syros, which
antient writers haue said to be in circuit 28 miles, and *Mutians* 160. Oliaros, Paros, with a
C towne, 38 miles from Delos, of great name for the white marble there, which at first men called
Pactia, but afterwards Minois. From it seuen miles and a halfe is Naxos (18 miles from De-
los) with a towne which they called Strongyle, afterwards Dia, within a while Dionysias, of
the plentifull vines, and others, Sicily the lesse, and Callipolis. It reacheth in circuit 75 miles,
and is halfe as long again as Paros. And thus far verily they obserue & note for the Cyclades;
the rest that follow for the Sporades. And these they be, Helenum, Phocussa, Phæcacia, Schi-
nussa, Phalegandros, and 17 miles from Naxos, Icaros: which gaue name to the sea, lying out as
far in length with two townes, for the third is lost: before-time it was called Dolichum, Macris,
and Ichtyoessa. It is scituate Northeast from Delos 50 miles: and from Samos it is distant
35 miles. Between Eubœa and Andros there is a firth 12 miles ouer. From it to Gereftum is
112 miles and a halfe: and then no order forward can be kept: the rest therefore shall be set
D downe huddle by heapes. Ios from Naxos 24 miles, venerable for the sepulchre of *Homer*: it
is in length 25 miles, and in former time called Phænice. Odia, Letandros, Gyaros with a town,
12 miles about. It is from Aneros 62 miles. From thence to Syrnus 80 miles. Cynethussa, Te-
los, famous for costly ointment. *Callimachus* calls it Agathussa. Donyfa, Pathmos, in circuit 30
miles. Corassia, Lebinthus, Leros, Cynara, Sycinus, which before-time was Oence, Heratia the
same that Onus, Casus otherwise Astræbe, Cimolus, alias Echinussa, Delos with a towne, which
Aristides nameth Byblis, *Aristotle* Zephyria, *Callimachus* Himallis, *Heracides* Syphnus and Acy-
tos, and this of all the Islands is the roundest. After it Machia, Hypere sometime Patage, or af-
ter some Platage, now Amorgos, Potyrgos. Phyle, Thera, when it first appeared it was called
E Calliste. From it afterwards was Therasia plucked: and between those twain soone after arose
Automate, the same that Hiera: and Thia, which in our daies appeared new out of the water
neere Hiera. Ios is from Thera 25 miles. Then follow Lea, Afcania, Anaphe, Hippuris, Hip-
purissusa. Astipalæa, of free estate, in compasse 88 miles: it is from Cadiscus a promontory of
Creta, 125 miles. From it is Plarca, distant 60 miles. And from thence Camina, 38 miles: then
Azibnitha, Lanise, Tragia, Pharmacusa, Techidia, Chalcia, Calynda, in which are the townes
Coos and Olymna. From which to Carpathus, which gaue the name to the Carpathian sea is
25 miles, and so to Rhodes with a Southerne winde. From Carpathus to Casos 7 miles: from
Casos to Samonium a promontorie of Crete, 30 miles. Moreover, in the Euboike Euripe, at
the first entrance wel-neere of it are the foure Islands Petalix, and at the end thereof, Atalante,
Cyclades, and Sporades: confined and enclosed on the East with the Icarian sea coasts of A-
F sia: on the West with the Myrtoum coasts of Attica. Northward with the Ægean sea: and
South with the Creticke and Carthaginian seas; and take vp in length two hundred myles.
The gulfe Pegaseus hath before it, Eutychia, Cicynethus, and Scyros about said: but the
vtmost of all the Cyclades and Sporades, Gerontia, Scadira, Thermeusis, Irrhesia, Solin-
nia, Eudemia, Nea, which is consecrate vnto *Minerva*. Athos before it hath foure, Pepare-
thus

thus with a town sometime called Euonos, 9 miles off, Scyathus 5 miles, and Iulios with a town 88 miles off. The same is from Mastusia in Corinthos 75 miles, & is it self in circuit 72 miles. Watered it is with the riuer Ilissus, from thence to Lemnos 22, and is from Athos 87. in compass it containeth 22 miles and a halfe. Townes it hath, Hephæstia and Marina, into the Market place wherof the mountain Athos casteth a shadow in the hottest season of sommer. Thafos a free State is from it five miles: in times past it was called Æria or Æthria. From thence Abdera in the continent is 20 miles: Athos 62: the Isle Samo-Thrace as much, being a free priuiledged state, and lying before Hebrus. From Imbrus 32 miles: from Lemnos 22 miles and a halfe: from the coast of Thracia 28 miles: in circuit it is 32 miles, and hath the rising of the hill Saoces for the space of ten miles, and of all the rest is fullest of hauens and harbors. *Callimachus* calleth it by the old name Dardania. Betwixt Cherrhonesus and Samo-Thrace is Halomesus, about 15 miles from either of them: beyond lieth Gethrone, Lamponia, Alopeconefus not farre from Cœlos, an haue of Cherrhonesus: and some other of no name or regard. In this sea let vs rehearse also the desert and vnpeopled Isles, such as we can finde names for, to wit, Desticos, Larnos, Cyssicos, Carbrusa, Celathusa, Scylla, Draconon, Arconesus, Dithusa, Scapos, Capheris, Mesate, Æantion, Phaterunefos, Pateria, Calete, Neriphus and Polendus.

The fourth of those great seas in Europe, beginning at Hellespont, endeth in the mouth of Mœotis. But briefly we are to describe the forme of the whole sea, to the end the parts may be sooner and more easily known. The vast and wide Ocean lying before Asia, and driuen out from Europe in that long coast of Cherfonesus, breaketh into the maine with a small and narrow issue, and by a Firth of 7 stadia, as hath been said, diuideth Europe from Asia. The first streights they call Hellespontus: this way *Xerxes* the King made a bridge vpon ships, and so led his armie ouer. From thence there is extended a small Euripus or arme of the sea for 86 miles space to Priapus a city of Asia, whereas *Alexander* the great passed ouer. From that place the sea grows wide and broad, and again gathereth into a streight: the largeness thereof is called Propontis, the streights Bosphorus, halfe a mile ouer; and that way *Darius* the father of *Xerxes* made a bridge ouer and transported his forces. The whole length of this from Hellespont is 239 miles. From thence the huge main sea called Pontus Euxinus, and in times past Axenus, takes vp the space between lands far distite and remote asunder, and with a great winding and turning of the shores bendeth back into certain horns, and lieth out-stretched from them on both sides, resembling evidently a Scythian bow. In the very mids of this bending it ioineth close to the mouth of the lake Mœotis, and that mouth is called Cimmerius Bosphorus, 2 miles and a halfe broad. But between the two Bosphori, Thracius and Cimmerius, there is a direct strait course between, as *Polybius* saith, of 500 miles. Now the whole circuit of all this sea, as *Varro* and all the old writers for the most part do witness, is 2150 miles. *Nepos Cornelius* addes thereto 350 miles more. *Artemidorus* maketh it 2919 miles. *Agrippa*, 2360 miles. *Mutianus*, 2865 miles. In like sort some haue determined and defined the measure on Europe side to be 4078 miles and a halfe: others, 1172 miles. *M. Varro* taketh his measure in this manner: from the mouth of Pontus to Apollonia 188 miles and a halfe: to Calatis as much. Then to the mouth of Ister 125: to Boristhenes 250: to Cherrhonesus a towne of the Heraclætes, 375 miles. To Panticapæus, which some call Bosphorus, the vtmost coast of Europe, 222 miles and a halfe, which in all makes 1336 miles and a halfe. *Agrippa* measureth thus: From Byzantium to the riuer Ister 560 miles: then to Panticapæum 630: from thence the very lake Mœotis taking into it the riuer Tanais, running out of the Rhiphæan hills, is supposed to beare the compass of 1306 miles, being the farthest bound betweene Europe and Asia. Others again make 11025 miles. But surely from his mouth to the mouth of Tanais, and take a streight course, it is 375 miles without question. The inhabitants of that coast haue bene named in the description and mention of Thrace, as farre as to Istropolis: now from thence the mouthes of Ister. This riuer arising among the hills of Abnoba a mountaine of Germanie, ouer against Rauricum a towne in Gaule, passing many a mile beyond the Alpes, and through innumerable Nations vnder the name of Danubius, with a mightie encrease of waters, and where hee first beginneth to wash Illyricum, taking the name of Ister after he hath receiued three score riuers, and the one halfe of them well neere nauigable, rolleth into Pontus with six huge streames. The first mouth of it is Peuces, soone after the Island it selfe Peuce, of which the next Channell

tooke

A tooke name, and is swallowed vp of a great miere of 19 miles. Out of the same channell and about Astropolis, a poole is bred of 63 miles compass, which they call Halmyris. The second mouth is called Naracustoma: the third Calostoma, neere the Island Sarmatica: the fourth Pseudostoma, and the Island Conopon Diabasis. After that, Boreostoma, and Spiroostoma. Each of these are so great, that by report the sea for 40 miles length within it is ouer-marched with the same, and the fresh water may so far be evidently tasted. From it, into the inland parts of the country, the people verily be all Scythians: but diuers other nations there be that inhabit the coasts next to the sea: in some places the Gete, called of the Romanes Daci: in others Sarmatæ, of the Greekes Sauromatæ; and among them, the Hamaxobij or Aorti. Elsewhere, the bastard and degenerate Scythians, who are come from base slaues, or else the Troglodites, and anon the Alani and Rhoxalani. But the higher parts betweene Danubius and the forest Hercynius, as farre as to the Pannonian wintering harbours of Carnuntum, and the confines there of the Germans, the fielden countrie also & plains of Iazegæ, the Sarmatians possesse. But the hills and Forrests, the Dakes who were expelled by them, do inhabit as farre as to the riuer Pythylus from Marus, or peradventure it is Duria, diuiding them from the Sueuians & kingdom of Vannians. The parts against these, the Bastarnæ doe keepe; and from thence, other Germans. *Agrippa* hath set downe that whole tract from Ister to the Ocean, to mount vnto 2000 miles, and 400 lesse in bredth, to wit, from the desarts of Sarmatia to the riuer Vistula. The name of Scythians euery where continually runs into Sarmatians and Germans. Neither hath that old denomination remained in any others but those, who (as I haue said) liue farthest off, and in the edge of these nations, vnkowne in manner to all men besides. But the townes next to Ister are Creniniscos, and Æpolium: the mountaines Macrorenij: the noble riuer Tyra, giuing name to the towne, whereas before-time it was called Ophiusa. Within the same there is a spacious Island, inhabited by the Tyragetæ. And it is from Pseudostomum, a mouth of Ister, 130 miles. Soone after be the Axiacæ, bearing the name after the riuer: beyond whom are the Crobzyti: the riuer Rhodæ: the creeke Sagaricus, and the haue Ordesus. And 120 miles from Tyra, is the great riuer Borysthenes; also a lake and people of that name: yea and a towne 15 miles within from the sea, called by ancient names Olbropolis, and Miletopolis. Again, in the sea side, the haue or harbour of the Achæans: the Island of *Achilles*, famous for the tombe of that worthy wight. And from it 135 miles, there is a demy Island lying out acrosse in fashion of a sword, called Dromos Achilleos, vpon occasion of his exercise there of running: the length whereof *Agrippa* hath declared to be 80 miles. All that tract throughout, the Taurisci, Scythians, and Sarmatians do inhabit. Then the wilde woodland countrie gaue the name vnto the sea Hylæum, which beates hard vpon it: the inhabitants are called Enaccloræ. Beyond, is the riuer Panticapes, which diuideth the Nomades and Georgians asunder: and soone after Accesus. Some writers doe shew, that Panticape together with Borysthenes, runne together in one confluent beneath Olbia, but they that write more exactly, doe name Hypanis. See how much they erred, who haue described it in a part of Asia. It entreth into the sea with a mighty great ebbe and returne of the water, vntill it be within five miles of Mœotis, compassing as it goeth a mighty deale of ground, and many nations. Then there is a gulfe or arme of the sea called Corcinites, and a riuer Pacyris. Towns, Naubarum and Carcine. Behind, is the lake Buges, let out into the sea by a great ditch. And Buges is self from Coretus (an arme or branch of the lake Mœotis) is disioyned, with a backe part full of crags and rocks. Riuers it receiue, Buges, Gerrhus, Hypanis, comming all from diuers quarters: for Gerrhus parteth the Basilides and Nomades. Hypanis, through the Nomades and the Hyleans, falleth into Buges by a channell made by mans hand, but in his owne naturall channell into Coretus. The region of Scythia is named Sendica. But in Carcinites, Taurica beginneth: which also in times past was enuironed all about with the sea, wherefoer now there lie plains and flat fields. But afterwards it mounteth vp with huge hills. Thirtie nations there be in it: and of them 24 be Inlanders. Six townes, Orgocyni, Caraseni, Assyriani, Traçari, Archilachitæ, and Caliodi. The very pitch and crest of the hill, the Scytotauri do hold. Bounded they are Westward, with Cherronesus; Eastward with the Scythian Satarchi. In the coast next to Carcinites are these townes, Taphra, in the very streights of the demy Island: then, Heraclea, Cherronesus, endowed with franchises by the Romans. A foretime it was called Megarice, and is the most ciuel & fairest of all the rest of that tract, as retaining still the names and fashions of the Greekes, and is besides compassed with a wall.

wall of five miles about. Then, the promontory Parthenium. A citie of the Tauri, Placia. The hauen Symbolon: the promontory Criu-metopon, ouer against Charambes a promontorie of Asia, running through the middle of Euxinus, for the space of 170 miles, which is the cause especially that maketh the forme abouesaid of a Scythian bow. Neere to it, are many hauens and lakes of the Tauri. The towne Theodosia, distant from Criu-metopon 122 miles, and from Chersonesus 165 miles. Beyond, there haue been towne, Cyte, Cephyrium, Acre, Nymphem, and Dia. And the strongest of them all by many degrees, standeth yet still in the very entry of Bosphorus, namely, Pantecapium of the Milesians, from Theodosia 1035 miles: but from Cimmerum a town scituate beyond the Firth, a mile and a halfe as we haue said. And this is al the bredth there that diuideth Asia from Europe: which sometime is passeable ouer most-what on foot, namely, when the Firth is frozen and all on yce. The breadth of Bosphorus Cimmerius is 12 miles and a halfe. It hath vpon it these townes, Hermisium, Myrmecium; and within it, an Island Alopecce. But along Mæotis, from the farthest narrow land passage, which place is called Taphræ, vnto the mouth of Bosphorus, it contains 260 miles. On Taphræ side, the Continent within-forth is inhabited by the Anchetæ, among whom Hypanis springeth: and Neuri, where Borysthenes hath his head. Moreover, the Geloni, Thussageræ, Budini, Basilidæ, and the Agathyrsi, with blew haire on their heads. Aboue them, the Momades, and the Anthropophagi. On Buges side aboue Mæotis, the Sauromates and Essedones dwell, but along the borders enen as far as Tanais, the Mæotæ, of whom the lake was so called, and the vtmost on their backs the Arimaspi. Within a little appeare the Rhiphæan hills, and a cuntry called Prephoros, for the resemblance of certain wings or feathers, occasioned by the continuall fall of snow. A part of the world thus is condemned by dame Nature, and drowned in deepe and thick darkenes, dwelling within no other houses but the workes of frozen cold, and the ycie harbors of the chilling Northerne wind. Behind those hills and beyond the North pole, there is a blessed and happy people (if we may beleuee it) whom they call Hyperborei, who liue exceeding long, and many fabulous and strange wonders are reported of them. In this tract are supposed to be the two points or poles about which the world turns about, and the very ends of the heauens reuolution. For 6 moneths together they haue one entire day; and night as long, when the Sunne is cleane turned from them: but their day beginneth not at the spring Equinoctiall (as the leaud and ignorant common people do imagine) and so continueth to the Autumne: for once in the yeere, and namely at our mid-sommer when the Sun entrench into Cancer, the Sun riseth with them: and once likewise it setteth, euen in the mid-winter with vs, when the Sun entrench Capricorne. The cuntry is open vpon the Sunne, of a blissefull and pleasant temperature, void of all noisome wind & hurtfull aire. Their habitations be in woods and groues, where they worship the gods both by themselves, and in companies and congregations: no discord know they; no sicknes are they acquainted with. They neuer die, but when they haue liued long enough: for when the aged men haue made good cheere, and annointed their bodies with sweet ointments, they leape from off a certain rocke into the sea. This kind of sepulture, of all others is most happy. Some Writers haue seated them in the first part of the sea coasts in Asia, and not in Europe, for that indeed some be there resembling the like manners and customes, and euen so scituate, named Atocori. Some haue set them iust in the mids between both Sunnes to wit, the setting of it with the Antipodes, and the rising of it with vs: which cannot possibly be, considering so vast and huge a sea comming betweene. As for those that haue placed them no where but in the six moneths day-light, haue written thus much of them, That they sow in the morning, reape at noone, at sun-setting gather the fruits from the trees, and in the nights lie close shut vp within caues. Neither may we make doubt of that nation, since that so many Authors doe testifie, That they were wont to send the first fruits of their corne, as far as Delos to Apollo, whom aboue all others they honour. And virgins they were that had the carriage of this present, who for certaine yeeres were venerable, and courteously entertained of all nations, vntill such time as vpon breach of faithfull hospitalitie, they took vp an order to bestow those sacred oblations in the next marches of their neighbour borderers: and they againe to conueigh the same to their neighbours that confined vpon them, and so forward as far as Delos. But soone after, this custome was for-let and cleane giuen ouer. The length of Sarmatia, Scythia, and Taurica, and of all that tract from the riuier Borysthenes, is 980 miles, the breadth 717, as M. Agrippa hath cast it. But I for my part suppose, that the measure of this part of the earth is vncertaine,

A vncertaine: but after the order which we haue begun, let vs go forward with the rest behind of all this diuision: as for the petty seas thereof we haue truly shewed them already.

CHAP. XIII.

¶ The Islands Pontus.

HELLESPONT hath no Islands to be spoken of, in Europe. In Pontus are two, a mile and halfe from Europ, and 14 miles from the mouth of the riuier, to wit, Cyaneæ, of others called Symplegades; and by report of fables they ran one into another: the reason was, because they being seuered by a small space betweene, to them that enter the sea full vpon them, they seemed twaine: but if they turned their eye a little aside from them, they made a shew as if they met together. On this side Ister there is one, pertaining to the Apolloniates, 80 miles from Bosphorus Thracius, out of which M. Lucullus brought Apollo Capitolinus. What are within the mouths of Ister we haue declared already. Before Borysthenes is the aboue named Achillea, called Leuce and Macaron. This, our moderne Cosmographers in these daies doe set 140 miles from Borysthenes, from Tyra 120: from the Island Peuce 50. It is in compasse about ten miles. The rest be in the gulfe Carcinites, namely Cephalonnefos, Rhosphodusa, and Macra. I cannot passe by the opinion of many writers, before we depart from Pontus, who suppose all the inland seas or Mediterranean arise from that head, and not from the streights of Gades: and they lay for their ground an argument not without some good probabilitie, because out of Pontus the sea alwaies floweth, and neuer ebbeth againe.

But now we are to depart from thence, that other parts of Europ may be spoken of: & when we are gone ouer the Rhiphæan hills, we must passe along close by the North Ocean, and keepe the left hand vntill we come to Gades. In which tract there are reported to be very many Isles without name: of which, as Tymæus reporteth, there is one before Scythia called Bannomanna, distant from Scythia one daies sailing: into which, in the temperate season of the spring, Amber is cast vp to the shore by the waues of the sea. All the other coasts are no otherwise marked and known but by vncertain heare-say. The North Ocean from the riuier Paropamisus, where as it dasheth vpon Scythia, Hecataeus nameth Amarchium, which word in the language of that nation signifieth, Frozen. Philemon writeth, that the Cymbrians call it Morimarusa, i. mortuum Mare, the dead sea, euen as far as to the promontorie of Rubæ: but all beyond forward, Cronium. Xenophon Lampfacenus saith, That three daies sailing from the Scythian coast there is the Island Baltia, of exceeding greatnesse. The same doth Pythias name Basylia. There be also named the Isles Oonæ, wherein the Inhabitants liue of birds egges and otes. Others also, wherein men are born with horse feet, called thereupon Hippopades. Others againe of the Panoti, who being otherwise naked, haue mighty great cares that couer their whole bodies. And now forward we begin at the nation of the Ingeuoni, the first of all the Germanes in those parts, to discover all vpon more sure and euident report. There is the exceeding great mountain Sevo, not inferior to the high hills Rhiphæi, which maketh a mighty huge gulfe, euen as far as the Cimbrians promontory, called Codanus: it is full of Islands, of which the goodliest of all is Scandinavia, the bignesse whereof is not yet discovered. A part only thereof, as much as is knowne, the nation of Heleuones doth inhabit in 500 villages, who call it a second world. And as it is thought, Enigia is no whit lesse. Some say that these parts, as far as to the riuier Vistula, is inhabited by the Sarmatians, Venetians, Soyrians, and Hirrians: also that the gulfe of the sea is called Clylipenus: and that in the mouth or entrance of it is the Island Latris. Also that not far from it there is another arme of the sea bounding vpon the Cimbrians. The promontory of the Cimbrians shooting far into the seas, maketh a demy Island, which is called Cartris: from which coast 23 Islands haue been discovered and known by the Roman armies; the noblest of them are Burchana, called of our cuntry men Fabaria, of the plenty of a pulse called Beans, growne there of it selfe vnsworne. Likewise Glesaria, so called by the soldiers, of Amber: but of the barbarous people Austrania; and besides them Adania. Along this sea coast, vntill you come to the riuier Scaldis, the German nations do inhabit, but the measure of that tract cannot easily be declared, such vnmeasurable discord and difference there is amongst Writers. The Greeks and some of our owne cuntry haue deliuered the coast of Germanie to be 2500 miles about. Agrippa again ioyning with it Rhetia and Noricum, saith that it is in length 886 miles,

and in bredth 268. And verily of Rhœtia alone, the bredth well-neere is greater, at leastwise at the time that it was subdued, and the people departed out of Germanie: for Germany many yeares after was discovered, and yet not all of it known throughly. But if it be lawful to gesse, there will not be much wanting in the coasts & compasse, according the opinion of the Greeks; nor in the length set down by Agrippa.

CHAP. XIV.

¶ Germanie.

OF Germanes there be five kindes: the Vindili, part of whom be the Burgundians, Varini, Carini, and Gurtones. A second sort, the Ingaevones, part of whom be the Cimbri, Teutoni, and people of the Cauchi. The next to them be the Istævones, and part of them be the Cimbri. Then the midlanders, the Hermiones, among whom are the Suevi, Hermunduri, Chatti, and Cherusci. The fifth are the Peucini, the Basternæ, bordering vpon the aboue-named Dacæ. Faire rivers that run into the Ocean, to wit, Guttalus, Vistillus, or Vistula, Albis, Visurgis, Amisus, Rhenus, Mosa. And within-forth the Hircynium hill, inferiour to none in estimation, standeth to gard and inclose them.

CHAP. XV.

¶ Islands in the Gaules Ocean.

Vpon the very Rhene it selfe, for 100 miles almost in length, lieth the most noble Island of the Batavi and Cannenufates: as also others of the Frisians, Cauchians, Frisiabones, Sturij, and Marsalij, spread within Helius and Flevus, for so be the mouthes into which Rhenus gushing, diuideth it selfe; and is discharged from the North into certain lakes: from the West into the riuer Mosa. But in the middle mouth between, hee beareth a small current and channell, and keepeth his owne name.

CHAP. XVI.

¶ England and Ireland.

OVER against this tract lieth Britannia, betweene the North and West, being an Island renowned both in Greeke and Roman records: opposite it is vnto Germanie, Gaule, and Spaine, the greatest parts by far of all Europe, and no small sea betweene. It was sometime named Albion, when all the Isles were called Britannia, of which anon we wil speak. This Island is from Gessoriacum, a coast towne of Morini, fifty miles, taking the next and shortest cut. In circuit, as *M. Pitheas* and *Isidor* report, it containeth 3825 miles. And now for these thirtie yeares well-neere, the Romane Capitaines grow into farther knowledge thereof, and yet not beyond the Forrest of Caledonia, as neere as it is. *Agrippa* supposeth that it is in length 800 miles, and in bredth 300. Also that Ireland is as broad, but not so long by 200 miles. This Isle is seated aboue it, and but a very short cut or passage distant from it, to wit, 30 miles from the people Silures. Of other Islands in this Ocean there is none by report in circuit more than 125 miles. Now there be Orcades 40, diuided asunder by small spaces betweene: *Acmodæ* 7, and 30 *Hæbudes*. Also betweene Britaine and Hibernia, *Mona*, *Monapia*, *Ricnea*, *Veëtis*, *Silimnus*, and *Andros*: but beneath them, *Siambis* and *Axantos*: and on the contrary side towards the Germane Sea there lie scattering the *Glessaria*, which the later Greeke Writers have named *Electrides*, for that Amber was there ingendred or bred. The farthest of all knowne or spoken of, is *Thule*, in which there be no nights at all, as we haue declared, about Midsummer, namely when the Sun passeth through Cancer: and contrariwise no daies in mid-winter: and each of these times they suppose do last six moneths, all day or all night. *Timæus* the Historiographer saith, that farther within-forth, and six daies sailing from Britain, there lieth the Island *Mëtis*, in which white lead grows; and that the Britans do saile thither in winter vessels, covered with leather round about, and well fowed. There be that make mention of others beside, to wit, *Scandia*, *Dumna*, *Bergos*, and *Nerigos* the biggest of all the rest, from the which men saile to *Thule*. Within one daies sailing from *Thule* is the frozen sea, named of some *Cronium*.

CHAP.

CHAP. XVII.

¶ Gallia.

ALL Gallia, by one name called *Comata*, is diuided into three kindes of people, and those seuered one from the other by riuers especially: to wit, Belgica, from *Scaldis* to *Sequana*: Celtica, from it to *Garumna*; and this part of Gallia is named *Lugdunensis*. From thence to the lying out of the mountaine *Pyrenæus*, *Aquitania*, formerly called *Aremorica*, *Agrippa* hath made this reckoning and computation of all Gaul generally, to wit, lying between *Rhene*, *Pyrenæus*, the Ocean, and the hills *Gebenna* and *Iura*; whereby hee excludeth *Narbonensis Gallia*, that is in length 420 miles, and in bredth 313. Next to *Scaldis* there inhabited the vtmost borderers, the *Toxandri*, vnder many names: then the *Menapij*, *Morini*, and *Oromanfici*, ioyning vpon the tract or territorie called *Gessoriacus*: the *Brinnani*, *Ambiani*, *Bellonici*, and *Hassi*. But farther within-forth, the *Castologi*, *Atrebatii*, and *Neruij*, free states: the *Veromandui*, *Sueroni*, and *Suessiones*, likewise free: the *Treviri* free before-time: the *Lingones* confederates, the *Remi* confederats also: the *Mediomotricæ*, the *Sequani*, the *Raurici*, & *Helverij*. Colonies two, *Equestris* and *Rauriaca*. Moreouer, of Germane nations in the same Province that dwell neere *Rhene*, the *Nemetes*, *Trivochi*, and *Vangiones*: then the *Vbij*, *Colonia*, *Agrippensis*, *Gugerni*, *Batavi*, and those whom we spake of in the Islands of *Rhene*.

CHAP. XVIII.

¶ Lugdunensis Gallia.

Lugdunensis Gallia containeth the *Luxovij*, *Velocasses*, *Galleti*, *Veneti*, *Abricatui*, *Osismij*, and the noble riuer *Ligeris*: but a more faire and goodly demy Island, running forth into the Ocean, from the very marches of the *Osismij*, hauing in circuit 625 miles, with the necke thereof 125 miles broad. Beyond it dwell the *Nannites*. Within-forth, the *Hædni* confederats, the *Carnuti* likewise confederats, the *Boij*, the *Senones*, the *Aulerici*, surnamed *Eburovices*, and the *Cenomannes* and *Meldi*, free States. *Parrhisij*, *Trecasses*, *Andegani*, *Viducasses*, *Vadicasses*, *Vnelli*, *Cariovelites*, *Drabhudi*, *Rhedones*, *Turones*, *Itefui*, and *Secusiani*, free States, in whose countrey standeth the Colonie *Lugdunum*.

CHAP. XIX.

¶ Aquitania.

That province of Gaule which is called *Aquitania*, belong the *Ambilatri*, *Anagnutes*, *Pictones*, the *Santones*, *Bituriges*, named also *Vibisci Aquitani*, whereof the Province tooke name, and the *Sediboniatæ*. Then such as were enrolled into townships from diuers parts, to wit, *Begerri*, *Tarbeli*, who came vnder foure ensignes, *Cocossati* vnder 6 ensignes, *Venami*, *Onobriates*, *Belendi*, and the forest *Pyrenæus*. Beneath them, *Monesi*, *Osquidiales*, *Mountainers*, *Sibillates*, *Camponi*, *Bercorates*, *Bipedimui*, *Sassumini*, *Vellates*, *Vornates*, *Conforanni*, *Aufci*, *Elufates*, *Sotriates*, *Osquidates* in the champion and plaine country, *Succasses*, *Iatufates*, *Bafabocates*, *Vassei*, *Sennates*, *Cambolestri*, *Agefinales*, ioyning to the *Pictones*. Then the *Bituriges* free, called also *Cubi*. Next to them, *Lemovires*, *Arverni* free, and *Gabales*. Again, those that confine and border vpon the province *Narbonensis*, the *Ruthenes*, *Cadumii*, *Autobroges*, & the *Petrogori*, diuided from the *Tolosanes* by the riuer *Tarme*. Seas about the coasts, vpon *Rhene* the North Ocean: between it and *Sequana* the Britan ocean: between it and *Pyrenæus*, the Gaule Ocean. Islands many, to wit of the *Veneti*, called also *Venetici*; and in the gulfes of *Aquitane*, *Vliarus*.

CHAP. XX.

¶ The hither Province of Spaine.

AT the Promontorie of *Pyrenæus* beginneth *Spain*, narrower not only than *Gaule*, but also so than it selfe (naturally) so huge a quantitie is wrought into it, while the Ocean of one coast, the *Iberian* sea on the other, do cling and presse the sides together. The very hills

of Pyrenæus, which from the East spread all the way to the Southwest, make Spaine shorter on the North side than the South. The next marches of this higher prouince is the same that the tract of Tarracon, namely from Pyrenæus along the Ocean, the Forrest and mountains of Vafcones. And first in this part you finde these townes: namely in the country of the Varduli, O-larso, Morofgi, Menofca, Velperies, the port towne Amanum, where now is Flaviobriga, and a colony of nine cities. The region of the Cantabri, the tiuer Sada, the port town of Viftoria, inhabited by the Iuliobrigenses. From that place the fountaines of Iberus, 40 miles. The haue Biendum, the Origeni entermingled with the Cantabri. Their hauens Vefci and Veca: the country of the Astures, the rowne Noega, in the demy Island Peficus. And then the countie Lucensis, and so from the riuer Navilubio, the Cibarci, Ego varri fynamed Namarini, Iadoni, Arrotiebræ, the promontorie Celticum. Riuer, Florius and Nelo. Celtici fynamed Nerix: and aboute them the Tamarici, in whose demy Island are 3 Altars called Sestianæ, dedicated to *Augustus*, Cœpori, and the towne Nœla. The Celtici, fynamed Præfamarci, and Cileni. Of Isles worth the naming, Corticata and Aunios. From the Cileni, the county town of the Bracæ, Heleni, Graviij, the castle Tyde, all disceded from the Greekes: the Islands Cicæ, the faire town Abobrica, the riuer Minius, with a broad mouth 4 miles ouer, the Leuni, Seurbi, *Augusta* a town of the Bracæ: and aboute them also, Gallæcia, the riuer Limia. Also the riuer Durius, one of the greatest in Spaine, springing in the Pelendones country, & running hard by Numan-tia, and so on, through the Arevaci and Vaccaï, diuiding the Vetones from Asturia, and the Gallæcians from Lusitania: and there also it keepeth off the Turduli from the Bracari. All this region aboute said from Pyrenæus, is full of mettall mines, to wit, gold, siluer, iron, lead, as well blacke as white, *i. tinne*.

CHAP. XXI.

¶ *Lusitania.*

AT the riuer Durius begins Lusitania, wherein are Turduli the old, Pefuri, the riuer Vacca, the towne Talabrica, the towne and riuer Minium. Townes, Conimbrica, Olisippo, Ebu-ro, Britium: from whence there runs out into the sea with a mighty cape, the promontorie which some haue called Artabrum; others, the Great; and many, Olisipponense, of the towne, making a diuision of land, sea, and aire aboute. In it is the side of Spaine determined and bounded, and from the compass of it beginneth the forefront thereof.

CHAP. XXII.

¶ *Islands in the Ocean.*

ON the one hand is the North and the Gauls Ocean: on the other, the West and the Atlantic Ocean. The shooting forth of the promontorie afore said some haue reported to be 60 miles, others 90. From thence to Pyrenæus there be writers not a few, who say it is 1250 miles, and that there is a nation of the Atabri, which neuer was, with a manifest error. For they haue set in this place by exchanging some letters, the Artotrebæ, whome wee named before the promontorie Celticum. They haue erred also and missed in certain famous riuers. From Minius aboute named, as *Varro* saith, Æminius is 200 miles distant (which some men take to be elfewhere, and call it Limæa) named of men in old time Oblivionis, and wherof goeth many a tale. From Durius to Tagus is 200 miles, and comes between. This Tagus is a riuer much renowned for the sand that yeelds gold. 160 miles from it the promontory Sacrum runs out from the middle front in manner of Spain: and 14 miles *Varro* saith it is from it to the mids of Pyrenæus. But from Ana, by which we haue separated Lusitania from Bætica, 126 miles, adding therto from Gades 102 miles. Nations, Celtici, Varduli, and about Tagus, the Vettones. From Ana to Sacrum the Lusitanes. Memorable townes, from Tagus in the coast side, Olisippo, of good note for the Mares that conceiue there by the West wind. Salatia, with addition of Vrbs Imperatoria, and Merobrica: the promontory Sacrum, & another called Cæneus: towns, Ossonoba, Balsa, and Myrtius. The whole prouince is diuided into three counties or iudiciall courts of Affises, Emeritenfis, Pacensis, and Scalabitanus. It containeth in all fine and forty States, wherein be fide Colonies, one Borough Towne of Romane Citifens, three enfranchised

A chified with the liberties of old Latium. Stipendiaries or Tributaries 36. Moreover, the Colonies be thus named, *Augusta Emerita*: and vpon the riuer Ana, *Metallinensis*, *Pacensis*, *Norbertis*, named also *Cæfariana*. To it are layed and inrolled *Castra Iulia* and *Castra Cæcilia*. The fift is *Scalabis*, called *Præsidium Iulium*. The free borough of Roman citifens, *Olyssippo*, named also *Felicitas Iulia*. Townes of the old Latium liberty, *Ebora*, which likewise was called *Liberalitas Iulia*: *Myrtis* also and *Salatia*, which we haue spoken. Of Tributaries, such as I am not loth to name, beside the aboute said in the additions of *Bætica*, *Augustobrigenses*, *Ammienfes*, *Aranditani*, *Axatricenses*, *Balsenses*, *Cæfarobrigenses*, *Caperenses*, *Caurenfes*, *Colarni*, *Cibilitani*, *Concordienfes*, the same that *Bonori*, *Interaufenfes*, *Lancienfes*. *Mirobrigenses*, fynamed *Celtici*, *Medubricenses*, the same that *Plumbarij*, *Ocelenses*, who also are *Lancienfes*, *Turtuli*, named *Barduli* and *Tapori*. *M. Agrippa* hath written, that *Lusitania*, together with *Asturia* and *Gallæcia*, is in length 540 miles, and in bredth 526. But all Spain from the two promontories of Pyrenæus, along the seas, takes vp in circuit of the whole coast, 2900 miles, and by others 2700. Ouer against Celtiberia be very many Isles, called of the Greekes *Cassiterides*, for the plenty of lead which they yeeld: and iust against the promontorie of the *Arrotrebæ*, fix named *Deorum* [of the gods] which some haue called *Fortunatæ*. But in the very point or cape of *Bætica*, from the mouth of the firth 75 miles, lieth the Island *Gades*, 12 miles long, as *Polybius* writeth, and three miles broad. It is from the maine, where it is neereft, lesse than * 700 paces, in other places aboute seven miles. The whole Isle it selfe contains the space of 15 miles in circuit. It hath within it a towne of Roman citifens named *Augusta*, Vrbs *Iulia Gaditania*. On that side that regards Spain, within 100 paces lieth another Island three miles long and one broad, wherein formerly was the towne *Gades*. The name of this Island, after *Ephorus* and *Thilifides*, is *Erythia*: but according to *Tymæus* and *Silenus*, *Aprodisias*: the naturall home-bred inhabitants call it *Iunonis*. The bigger of these two *Gades*, as saith *Tymæus*, was by them called *Cotinus*, our countrymen name it *Tartessos*, the Carthaginians * *Gadir*, which in the Punicke language signifieth the * number of seven. *Erythia* the other was called, because the *Tirians*, who were the first inhabitants, were reported to haue had their first beginning out of the red sea *Erythræum*. Some thinke that *Geryon* here dwelt, he whose droues of cattell *Hercules* had away. Some againe thinke it is another, ouer against *Lusitania*, and there sometime so called.

* I effethan 3 quarters of a miles.

* Or *Gadir*.
* *Septem*, or ad
some: ad, *Septem*, i. a park
or enclosure.

CHAP. XXIII.

¶ *The measure of all Europe.*

HAuing finished our circuit about Europ, we must now yeeld the totall summe and complete measure of it in the whole, that such as are desirous of knowledge be not to seek in any one thing. *Artemidorus* and *Isidore* haue set downe the length thereof from *Tanais* to *Gades*, 840 14 miles, *Polybius* hath put down the bredth thereof, from Italy to the Ocean 1150 miles, for as then the largeness thereof was not knowne. Now the very bredth of Italy alone by it selfe (as we haue shewed) is 1220 miles to the Alps: from whence by Lyons to the Britaine part of the Morini (which way *Polybius* seemeth to take his measure) is 1168 miles. But the more certaine measure and the longer is directed from the said Alps to the West, and the mouth of the Rhine, through the place called *Castra Legionum Germaniæ*, 1243 miles. Now from henceforward we will describe *Africke* and *Asia*.

THE FIFTH BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS
SECVNDVS.

The description of Africke.

Africke the Greekes haue called *Lybia*, euen all that tract from whence the *Lybian* sea before it beginneth, and endeth in the *Egyptian*. No part of the earth receiueth fewer gulfes and armes of the sea, in that long compasse of crooked coasts from the West. The names as well of the Nations as towns there be of all others most hard to be pronounced, vnlesse it be in their owne tongues, and againe they be castles and forts for the most part that they dwell in.

CHAP. I.

¶ Mauritania.

At the beginning, the lands of Mauritania vntill the time of *C. Caesar*, [*i. Caligula*] sonne of *Germanicus*, were called kingdomes: but by his cruelty diuided it was into two prouinces. The vtmost promontorie of the Ocean is named of the Greeks *Ampelusia*: the townes therein were *Lissa* and *Cotes*, beyond *Hercules* pillars. Now in it is *Tingi*, sometime built by *Antaus*: and afterward by *Claudius Caesar* when he made a Colonie of it, it was called *Traduſta Iulia*. It is from *Batice* a towne in *Batica* by the next and neereſt paſſage ouer ſea thirty miles. Fiue and twenty miles from it in the Ocean coaſt ſtandeth a Colonie erected by *Augustus*, now *Iulia Conſtantia*, exempt from the dominion and iuriſdiction of the Kings of *Zilis*, and commanded to go for law and iuſtice as far as *Batica*. And two and thirty miles from it, *Lixos*, made a Colony by *Claudius Caesar*; whereof in old time there went many fabulous and loud lying tales. For there ſtood, they ſay, the royall pallace of *Antaus*: there was the combat betwene him and *Hercules*: there alſo were the gardens and hort-yards of the *Heſperides*. Now there floweth thereinto out of the ſea a certain creek or arme thereof, and that by a winding channell, wherein men now take it that there were Dragons ſeruing in good ſtead to keepe and gard the ſame. It incloſeth an Iſland within it ſelfe, which, notwithstanding the Tract thereby be ſomewhat higher, is onely not ouerflowed by the ſea tides. In it there ſtandeth erected an altar of *Hercules*: and ſetting aſide certaine wilde Oliues, nothing elſe is to be ſeen of that goodly groue, reported to beare golden Apples. And in good faith leſſe may they wonder at the ſtrange lies of Greece, giuen out of theſe and the riuer *Lixus*, who would but thinke how of late our countrey men haue deliuered ſome fables of the ſame things as monſtrous well-neere: to wit, That this a moſt ſtrong and mighty city, and bigger than great Carthage: moreover, that it is ſituate right againſt it, and an infinite way well-neere from *Tingi*: and other ſuch like, which *Cornelius Nepos* hath been moſt eager to beleue. From *Lixus* forty miles in the midland part of the main ſtands *Babba*, another Colony of *Augustus*, called by him *Iulia* in the field or champion: alſo a third 75 miles off, called *Banafa*, but now it hath the addition of *Valentia*. 35 miles from it is the towne *Volubile*, iuſt in the mid way between both ſeas. But in the coaſt and borders thereof, fifty miles from *Lixus*, runneth *Subur* a goodly plenteous riuer, and nauigable neere to the Colony *Banafa*. As many miles from it is the towne *Sala*, ſtanding vpon a riuer

A a riuer of the ſame name, neere now vnto the wildeſneſſe, much infeſted and annoied with whole heards of Elephants, but much more with the nation of the *Autololes*, through which lies the way to *Atlas* the moſt fabulous mountaine of all *Africke*. For writers haue giuen out, that this hill ariſing out of the very miſt of the ſea ſands, mounteth vp to the ſkie, all rough, ill fauored, and ouergrowne on that ſide that lieth to the ſhore of the Ocean, vnto which it gaue the name; and yet the ſame is ſhadowie, full of woods, and watered with veines of ſpouting Springs that way which looketh to *Africke*, with fruitfull trees of all ſorts, ſpringing of the own accord, and bearing one vnder another, in ſuch ſort, that at no time a man can want his pleaſure and delight to his full contentment. Moreouer, that none of the inhabitants there are ſcene all day long: all is ſtill and ſilent, like the fearful horror in deſert wildeſneſſe: and as men come neerer and neerer vnto it, a ſecret deuotion ariſeth in their hearts, and beſides this feare and horreur, they are liſted vp about the clouds, and euen cloſe to the circle of the Moone.ouer and beſides, that the ſame hill ſhineth oftentimes with many ſaſhes of fires, and is haunted with the wanton laſciuius *Egipanes* and *Satyres*, whereof it is full, that it reſoundeth with noiſe of Haut-boies, pipes, and fifes, and ringeth againe with the ſound of tabers, timbrels, and cymbals. Theſe be the reports of great & famous writers, to ſay nothing of the labors and works both of *Hercules* and *Perses* there; and to conclude, that the way vnto it is exceeding great, and not certainly knowne. Bookes there were beſides of *Hanno*, a great captain and commander among the *Carthaginians*, who in the time of the moſt flouriſhing ſtate of Carthage, had a charge and commiſſion to diſcouer and ſuruey the whole compaſſe of *Africke*. Him, moſt of the Greeks as well as our countrey men following, among ſome other fabulous ſtories, haue written that hee alſo built many cities there, but neither memoriall vpon record, nor any token of them at all is left extant. Whiles *Scipio Amylianus* warred in *Africke*, *Polybius* the writer of the *Annales*, receiued of him a fleet: who hauing ſailed about of purpoſe to ſearch into that part of the world, hath put thus much downe in writing, that from the ſaid mountaine *West*, toward the foreſt full of wild beaſts which *Africke* breedeth, vnto the riuer *Anatis*, are 485 miles. And from thence to *Lixus* 205. *Agrippa* ſaith, that *Lixus* is diſtant from the ſtreights of *Gades* 112 miles. Then, that there is an arme of the ſea called *Saguti*. Alſo a towne vpon the promontory, *Mutelacha*. Riuers, *Subur* and *Sala*. Moreouer, that the hauen *Rutubis* is from *Lixus* 313 miles. And ſo forward to the Promontorie of the Sun. The port or hauen *Rifardir*; the *Gætulians*, *Autololes*, the riuer *Cofenus*, the nation of the *Scelartites* and *Maſſalians*. The riuers *Maſatal* and *Darat*, wherein *Crocodiles* are ingendred. Then forward, that there is a gulfe of 516 miles, incloſed within the promontory or cape of the mountain *Barce*, running along into the *West*, which is called *Surentium*: after it, the riuer *Palfus*, beyond which are the *Æthiopians* *Perorſi*, & at their back are the *Pharufi*. Vpon whom ioine the midlanders, to wit, the *Gætulianders*. But vpon the coaſt are the *Æthiopian* *Daratites*, the riuer *Bambotus* full of *Crocodiles* & *Hippopotames* [*i. Water-horſes*]. From which, he ſaith, That there is nothing but mountains all the way as far as to that which we call *Theon-Ochema* (The gods chariot.) Then, in ſailing nine daies and nights to the promontorie *Heſperium*, he hath placed the mountain *Atlas* in mid-way thereof, which by all other writers is ſet downe to be in the vtmoſt marches of Mauritania. The firſt time that the Romans warred in Mauritania, was in the time of prince *Claudius* Emperor: at what time as *Ademon* the freed ſeruant of king *Protolomeus*, by *C. Caesar* ſlaine, went about to reuenge his death; for as the barbarous people retired and fled back, certaine it is that the Romans came as far as to the hill *Atlas*. And not only ſuch Generals as had bin Conſuls, and were of the Senators degree and calling, who at that time managed and conducted the wars, but knights alſo and gentlemen of Rome, who from that time had gouernment and command there, tooke it for an honor and glory, that they had pierced and entred into *Atlas*. [* Fiue Romane Colonies, as wee haue ſaid, be in that prouince;] and by that common fame and report, there may ſeeme to lie a thorow faire thither. But that is found for the moſt part by daily experience, moſt deceiueable of all things elſe, becauſe perſons of high place and great worth, when they are loath to ſearch out narrowly into the truth of matters, ſticke not for ſhame of ignorance, to giue out vntruths: and neuer are men more credulous and apt to beleue and be deceiued, than when ſome graue perſonage fathereth a lie. And verily I leſſe maruell, that they of gentlemenſ degree, yea, and thoſe now of Senators calling, haue not come to the certaine knowledge of ſome things there: ſeeing they ſet their whole affection and mind vpon nothing but exceſſe and riot; which how powerfull

* It ſeemeth that this claue is to be ſet in the beginning of the next chapter.

powerfull it is and forcible, is seen by this most of all, when forests are sought out far and neere for Iuory and Citron trees; when all the rocks in Getulia are searched for Murices and Purpura [shell fishes that yeeld the purple crimfon colour.] Howbeit, the natural inhabitants of that country do write, That in the sea coast 150 miles from Sala, there is the riuier Afana, that receiueth salt water into it, but hath in it a goodly faire hauen; and not far from it another fresh riuier, which they call Fur: from which to Dyris (for that is the name in their language of Atlas, by a generall consent) are 100 miles, with a riuier comming betweene, named Vior. And there, the speech so goeth, are to be seene the certain tokens of a ground sometimes inhabited; to wit, the reliques of vine yards and date tree groues. *Suetonius Paulinus* (a Confull in our time) who was the first Roman leader, that for certaine miles space went ouer Atlas, also hath reported verily as touching the height thereof, that with the rest: and moreouer, that the foot thereof toward the bottom, stand thick and full of tall woods, with trees therein of an vnknown kinde, but the height of them is delectable to see to, smooth and euen without knots, the leaues & branches like Cypresse, and besides the strong smell they yeeld, are couered all ouer with a thinne downe, of which (with some help of Art) fine cloath may be made, such as the silk-worm doth yeeld. That the top and crest thereof is couered ouer with deepe snow euen in Sommer time. Moreouer, that he reached vp to the pitch of it at the tenth daies end, & went beyond it, as far as a riuier called Niger, through wildernesses full of blacke dust; where otherwhiles there stood out certaine clifffes, and craggie rocks, as they were scorched and burnt; and that those places by reason of partching heat were not habitable, albeit a man made triall thereof in the winter season: furthermore, that the pesants who dwelt in the next forests, were pestered with Elephants, wilde beafts, and serpents of all sorts; and those people were called Canarij, for that they and dogs feed together one with another, and part among them the bowels of wild beafts. For certaine it is knowne, that a nation of the Aethyopians whom they call Peroeci, ioineth vpon them. *Tuba* the father of *Ptolomeus*, who before time ruled ouer both Mauritanes, a man more memorable and renowned for his study and loue of good letters, than for his kingdome and royall port, hath written the like concerning Atlas: and he saith moreouer, that there is an herb growing there called Euphorbia, of his Physitions name that first found it: the milkie iuice whereof he praiseth wondrous much, for to cleare the eies, and to be a preseruatiue against all serpents and poisons whatsoeuer; and thereof hath he written a treatise, and made a book by it selfe: thus much may suffice, if it be not too much, as touching Atlas.

CHAP. II.

¶ The prouince Tingitania.

The length of the Prouince Tingitania taketh 170 miles. The nations therein be these: the Mauri, which in times past was the principall, and of whom the prouince took name: and those most writers haue called Marusij. Being by war weakened and diminished, they came in the end to a few families only. Next to them were the Massasuli, but in like manner were they consumed. Now is the prouince inhabited by the Getulians, Bannurri, and the Autololes, the most valiant and puissant of all the rest. A member of these were sometime the Vesuni, but being diuided from them, they became a nation by themselves, and bounded vpon the Aethyopians. The prouince naturally full of mountains Eastward, breedeth Elephants. In the hill also Abila, and in those which for their euen and equal height they call, The 7 brethren: and these butt vpon Abila, which looketh ouer into the sea. From these beginneth the coast of the Inward sea. The riuier Timuda nauigable, and a town sometime (of that name.) The riuier Laud, which also receiueth vessels. The town Rufardie, and the hauen. The riuier Malvana nauigable. The towne Siga iust against Malacha scituate in Spaine: the Royall seat of *Syphax*, and now the other Mauritania. For a long time they kept the names of KK. so as the vtmost was called Bogadiana: and likewise Bocchi, which now is Caesarienses. Next vnto it is the hauen, for the largenesse thereof called Magnus, with a towne of Roman citizens. The Riuier Muluca, which is the limit of Bocchi and the Massasuli. Quiza Xenitana, a towne of strangers: Arfennaria, a towne of Latines three miles from the Sea: Carcenna, a Colonie of *Augustus*, erected for the second Legion: likewise another Colonie of his planted with the Pretorian band, Gunugi, and the promontorie of *Apollo*. And a most famous towne there Caesarea, vsually before time called Iol, the Royall Seat of King *Tuba*: endowed by *Claudius* the Empe-

-tour

- A rour of happie memorie, with the franchises and right of a Colonie, at whose appointment the old souldiers were there bestowed. A new towne, Tipasa, with the grant of the liberties of Latrium. Likewise Icosium, endowed by *Vespasian* the Emperour, with the same donations. The colonie of *Augustus* Rusconia, and Ruscurium, by *Claudius* honoured with the free burgeoisie of the citie. Rusoezus, a colonie of *Augustus*. Saldea, Colonie of the same man. Igelgili also, and Turca, a towne seated vpon the sea and the riuier Amfaga. Within the land, the Colonie Augusta, the same that Succubar, and likewise Tubrisuptus. Cities, Timici, Tigaur. Riuers, Sardabala and Nabar. The people Macurebi; the riuier Vfar, and the nation of the Nabades. The riuier
- B Ampfaga is from Caesarea 233 miles. The length of Mauritania both the one and the other together, is 839 miles; the breadth 467.

CHAP. III.

¶ Numidia.

- NEXT to Ampfaga is Numidia, renowned for the name of *Masaniſſa*, called of the Greekes the land Metagonitis. The Numidian Nomades, so named of changing their pasture, who carry their cottages or theds (and those are all their dwelling houses) about with them vpon waines. Their townes be Cullu and Ruscade, from which 48 miles off within the Midland parts, is the colonie Cirta, surnamed of the Cirtanes: another also within and a free borough town, named Bulla Regia. But in the vtmost coast, Tacatua, Hippo Regius, and the riuier Armua. The towne Trabacha, of Roman citizens: the riuier Tusca, which boundeth Numidia, and besides the Numidian marble, and great breed of wilde beafts, nothing is there else worth the noting.

CHAP. IV.

¶ Africa.

- FROM Tusca forward, you haue the region Zeugitana, and the countrey properly called Africa. Three promontories, first the White; then anon that of *Apollo* ouer-against Sardinia: and a third of *Mercurie* opposite to Sicilie, which running into the sea make two creekes: the one Hipponensis, next to the towne which they call Hippo rased; the Greekes name it Diarrhyton, for the little brooks and rills that water the grounds: vpon this, there bordereth Theudalis, an exempt towne from tribute, but somewhat farther from the sea side; then the promontory of *Apollo*. And in the other creek, Vtica, a towne of Roman citizens, ennobled for the death of *Caio*, and the riuier Bagrada. A place called Castra Cornelia: and the colony Carthago, among the reliques and ruines of great Carthage, and the colony Maxulla: towns, Carpi, Misina, and the free borough Clupea vpon the promontorie of *Mercurie*. Item, free townes, Curubis, and Neapolis. Soone after ye shall meet with another distinction of Africke indeed. Libyphoenices are they called, who inhabit Byzacium; for so is that region named; containing in circuit 250 miles, exceeding fertile and plenteous, where the ground sowne yeeldeth again to the husband-man 100 fold increase. In it are free townes, Leptis, Adrumetum, Ruspina and Thapfus: then Thenna, Macomades, Tacape, Sabrata, reaching to the lesse Syrtis: to which, the length of Numidia and Africa from Ampfaga, is 580 miles: the breadth, each thereof as is knowne, 200. Now this part which wee haue called Africke, is diuided into prouinces twaine, the old and the new; separated one from the other by a fosse or ditch brought as farre as to Thenna, within the Africane gulfes, which towne is 217 miles from Carthage: and that trench *Scipio Africanus* the second, caused to be made, & bare halfe the charges together with the KK. The third gulfes is parted into twaine, curfed and horrible places both, for the cbbing and flowing of the sea, and the shelles betweene the two Syrtis. From Carthage to the nearer of them, which is the lesse, is 300 miles by the account of *Polybius*: who saith also, that the said Syrtis is for 100 miles forward dangerous, and 300 about. By land also thither, the way is passeable by obseruation of the Stars, at one time of the yeare onely. and that lyeth through desert sands and places full of serpents. And then you meet with Forrests replenished with numbers of wilde beafts. And within-forth Wildernesses of Elephants: and soone after, waste deserts euen beyond the Garamantes, who from the Augila are distant twelue daies iourney. Above

Above them was the nation of the Psylli, and above them the lake of *Diomedes* enuironed with desarts. Those *Auglæ* themselves are seated well neere in the middle way from *Æthiopia*, which bendeth Westward, and the countrey lying between the two Syrtis, with equall distance between of both sides: but the shore betweene the two Syrtis, of 250 miles. There standeth the citie *Ocenus*, the riuer *Cinyph* and the countrey. Townes, *Neapolis*, *Taphra*, *Abrotonum*, the other *Leptis*, called also the great. Then the greater *Syrtis*, incompasse 625 miles, and in direct passage 313. Next to it, there inhabit the people *Cisipades*. In the inmost gulfes was the coast of the *Lotophagi*, whom some haue called *Alachroas*, as far as to the alters of *Phylæna*, and of sand are they. Next to them, not farre from the Continent, the vast and wide Meere admitteth into it the riuer *Triton*, and taketh the name of him: but *Callimachus* calleth it *Pallantias*, and saith it is on this side the lesser Syrtis; but many place it between both *Cyrtes*. The promontory that encloseth the bigger, is named *Boryon*. Beyond it is the prouince *Cyrenaica*. From the riuer *Amphaga* to this bound, *Africke* contains 26 States, who are subiect to the *Romane* Empire: among which are six colonies besides the aboue-named, *Vthina* and *Tuburbis*. Townes endowed with Franchises of *Roman* citizens 15. Of which those in the midland parts, worthy to be named, are *Azuritanum*, *Abutucence*, *Aborienfe*, *Canopicum*, *Chilmanense*, *Simittuense*, *Thunusidense*, *Tuburnicense*, *Tynidrumense*, *Tribigense*, *Vicitana* twain, the greater and the lesse, and *Vagienfe*. One towne enioying the liberties of *Latium*, *Vsalitanum*. One tributary or pensionary towne neere *Castra Cornelia*, paieth custome and duties to *Rome*. Free townes 30, of which there are to be named within forth, *Arolitanum*, *Acharitanum*, *Auinenfe*, *Abziritanum*, *Canopitanum*, *Melzitanum*, *Madaurenfe*, *Salaphitanum*, *Tusdritanum*, *Tiricenfe*, *Tiphicenfe*, *Tunicense*, *Theudenfe*, *Tagestenfe*, *Tigenfe*, *Vlusibritanum*, another *Vagenfe*, *Vigenfe* and *Zamenfe*. The rest may well be called not only cities, but also for the most part, Nations, namely the *Naratontes*, *Capitani*, *Misulani*, *Sabarbares*, *Masili*, *Misues*, *Vamacures*, *Ethini*, *Masini*, *Marcubij*, and *Gatulia* all and whole, euen to the riuer *Nigris*, which parteth *Affricke* and *Æthiopia*.

CHAP. V.

¶ *Cyrene*.

The region *Cyrenaica*, called also *Pentapolitana*, is famous and renowned for the Oracle of *Hammon*, which is from *Cyrenæ* 400 miles, for the fountaine of the Sunne, and principally for 5 cities, *Berenice*, *Arfinoe*, *Ptolemais*, *Apollonia*, and *Cyrene* it selfe. *Berenice* standeth vpon the vtmost winding and nouke of *Syrtis*, called sometim the city of the aboue-named *Hesperides*, according to the wandering tales of *Greece*. And before the towne, not far off, is the riuer *Lethon*, the sacred groue where the hort-yards of these *Hesperides* are reported to be. From *Leptis* it is 385 miles. From it stands *Arfinoe*, usually named *Teuchira*, 43 miles: and from thence 22 miles, *Ptolemais*, called in old time *Barce*. And then 250 miles off the promontory *Phycus* runs out along the *Creticke* sea, distant from *Tanarus* a cape of *Laconia*, 350 miles: but from *Creet* it selfe 125 miles. And after it *Cyrene*, 11 miles from the sea. From *Phycus* to *Apollonia* is 24 miles; to *Cherronesus* 88; and so forth to *Catabathmus* 216 miles. The inhabitants there bordering, be the *Marmaridæ*, stretching out in length almost from *Paratonium* to the greater *Syrtis*. After them the *Araruceles*: and so in the very coast and side of *Syrtis*, The *Nasamones*, whom before-time the *Greekes* called *Mesammones* by reason of the place, for that they were seated in the middest betweene the two quicke sands. The *Cyrenaick* countrey, for the space of 15 miles from the sea side, is fruitfull for trees: and for the same compasse within the land, but for come onely: but then for 30 miles in bredth, and 250 in length, for the gum *Lafer* and nothing else. After the *Masamones*, the *Hasbitæ* and *Masæ* do liue. Beyond them the *Hammanientes*, eleuen daies iournie from the greater *Syrtis* to the West, and euen they also euery way are compassed about with sands: howbeit they find without much ado pits almost in cubits deepe, for that the waters there of *Mauritania* doe ouerflow. Houses they make themselves of salt, hewed out of their owne hills in manner of stone. From these to the *Troglodites*, in the South-west coast is foure daies iournie, with whom they chaffer and traffick onely for a certaine precious stone or gem, which we call a *Carbuncle*, brought out of *Æthiopia*. There comes betweene, the countrey *Phazania*, lying toward the wilde nesse abouesaid of *Africke*, about the lesse *Syrtis*: where we subdued the nation of the *Phazaniij*, together with the cities

ties *Alele* and *Cillaba*. In like manner *Dydammus* ouer-against *Sabrata*. Next to whom there is a mountain, reaching a great way from the East into the West, called by our men *Ater*, naturally as it were burnt, & like as if it were scorched, and set on fire with the reflection of the Sun. Beyond that mountain are the desarts: also *Matelga* a town of the *Garamants*, & likewise *Debris*, which casteth forth a spring of waters seething vp from noon to midnight exceeding hot: and for as many houres again into midday most chilling cold; also the most goodly towne *Garama*, the chiefe head of the *Garamantes*. All which places the *Romanes* haue conquered by force of armes, and ouer them *Cornelius Balbus* triumphed, the onely man of forceners that was honoured with the triumphant chariot, and endowed besides with the freedome of *Romane* citizens. For why, being borne at *Gades*, he and his vncle both, *Balbus* the elder, were made free denizens of *Rome*. And this is maruell that our writers haue recorded, that besides the towns abouenamed by him conquered, himselfe in his triumph caried the titles and pourtraites not of *Cydamus* and *Garama* only, but also of all other nations and cities, which were ranged in a Roll, and went in this order, The towne *Tabidium*, the nation *Niteris*, the towne *Negligina*, a Roll, and went in this order, The towne *Tabidium*, the nation *Niteris*, the towne *Negligina*, the nation *Bubeium*, the town *Vel*, the nation *Enipi*, the town *Thuben*, the hill named *Niger*. The towns *Nitibrum* and *Rapla*, the nation *Discera*, the town *Debris*, the riuer *Nathabari*. And again forward, these townes lying one to another together, *Baracum*, *Buluba*, *Alasibari*. And again forward, these townes lying one to another together, *Baracum*, *Buluba*, *Alasibari*. And again forward, these townes lying one to another together, *Baracum*, *Buluba*, *Alasibari*. The hill *Gyri*, wherein *Titus* hath reported that precious stones were engendred. Hitherto the way to the *Garamants*, was intricate and vnpassable, by reason of the robbers and theeves of that countrey, who vsed to dig certain pits in the way (which to them that know the quarters of the countrey, is no hard matter to doe) and then couer them vnder the conduct and fortunate auspices of *Vespasian* the Emperor, there was found a short and neere way of foure daies iourney; & this way is called *Præter caput Saxi* (besides the rocks head) The frontier towne of *Cyrenaica* is called *Catabathmos*, which is a towne and a vaile all on a sudden falling with a steepe descent. To this bound, from the lesse *Syrtis*, *Cyrenaica* *Africa* lieth in length 1060 miles, and in bredth, for so much as is knowne, 800.

CHAP. VI.

¶ *Lybia* *Mareotis*.

The countrey following is named *Mareotis* *Libya*, and boundeth vpon *Ægypt*, inhabited by the *Marmaridæ*, *Adymachidæ*, and so forward with the *Mareotæ*. The measure of it from *Catabathmos* to *Paratonium*, is 86 miles. In that tract there lyeth in the way betweene the village *Apis*, a place renowned for the religious rites of *Ægypt*. From it to *Paratonium* are 12 miles. From thence to *Alexandria* 200 miles: the bredth thereof is 169 miles. *Eratostrhenes* hath deliuered in writing, that from *Cyrenæ* to *Alexandria* by land is 525 miles. *Agrippa* saith, that the length of all *Africke* from the *Atlanticke* sea, together with the inferiour part of *Ægypt* containeth 3040 miles. *Polybius* and *Eratostrhenes*, reputed to haue bin most exact and curious in this kinde, set downe, from the Ocean to great *Carthage* 1600 miles. From thence to *Canopicum* the neere mouth of *Nilus*, they make 1630 miles. *Isidore* reckoneth from *Tingi* to *Canopus* 3599 miles. And *Artemidorus* forty lesse than *Isidorus*.

CHAP. VII.

¶ *Islands about Africke, and ouer-against Africke*.

These seas haue not very many Islands within them. The fairest of them all is *Meninx*, 35 miles long, and 25 broad, called by *Eratostrhenes* *Lotophagitis*. Two towns it hath, *Meninx* on *Africke* side, and *Thoar* on the other: it selfe is seicuate from the right hand promontorie of the lesse *Syrtis* 200 paces. A hundred miles from it against the left hand is *Cercina*, with a free towne of the same name, in length it is 25 miles, and halfe as much in bredth where it is most; but toward the end not above five miles ouer. To it there lieth a pretty little one toward *Carthage* called *Cerciniris*, & ioineth by a bridge vnto it: from these almost 60 miles, lies *Lopadusa* six miles long. Then, *Gaulos* and *Galata*: the earth whereof killeth the *Scorpion*, a fell

* Or 1500 paces, a mile and a half.

crea-

creature, and noisome to Africke. Men say also that they wil die in Clupea, ouer against which lieth Corfyra, with a towne. But against the gulfes of Carthage be the two Æginori, rocks more like than Islands, lying most between Sicily and Sardinia. There be that write how these sometime were inhabited, but afterwards sunke downe and were couered.

CHAP. VIII.

¶ The Æthyopians.

BVt within the inner compasse and hollow of Africke toward the South, & about the Gæbulians, where the deserts come between, the first people that inhabit those parts, be the Libij Ægyptij, and then the Leucæthiopes. About them are the Æthyopian nations, to wit, the Nigritæ, of whom the riuer tooke name: the Gymetes, Pharusi, and those which now reach to the Ocean, whom we spake of in the marches of Mauritania, namely, the Perorsi. From all these, it is nothing but a wilderness Eastward, till you come to the Garamantes, Augylæ, and Troglodites, according to the most true opinion of them, who place 2 Æthiopiae about the deserts of Africk; and especially of *Homer*, who saith, that the Æthyopians are divided 2 waies, namely, East and West. The riuer Nyger is of the same nature that Nilus. It bringeth forth Reed and Papyr, breedeth the same living creatures, and riseth or swellth at the same seasons. It springeth betweene the Tareleia Æthyopians, and the Oecalicæ. The towne Mavin belonging to this people, some haue set vpon the wilderness; as also, neere vnto them, the Atlantes, the Ægipanes, halfe wilde beasts, the Blemmyi, the Gamphasants, Saryres, & Himantopodes. Those Atlantes if we will beleue it, degenerate from the rites and manners of all other men. For neither call they one another by any name, and they look wistly vpon the Sun, rising, & setting, with most dreadful curses, as being pernicious to them & their fields; neither dream they in their sleep as other men. The Troglodites dig hollow caues, and these serue them for dwelling houses; they feed vpon the flesh of serpents. They make a gnashing noise, rather than utter any voice, so little vse haue they of speech one to another. The Garamants liue out of wedlock and conuerse with their women in common. The Augylæ do noworship to any but to the diuels beneath. The Gamphasantes bee all naked, and know no Wars, and fort themselves with no forrainer. The Blemmyi, by report haue no heads, but mouth and eies both in their breast: the Saryres besides their shape only, haue no properties nor fashions of men. The Ægipanes are shaped, as you see them commonly painted. The Himantopodes be some of them limber legged and tender, who naturally go creeping on the ground. The Pharusi, sometime Perseæ, are said to haue bin the companions of *Hercules*, as he went to the Hesperides. More of Africke worth the noting, I haue not to say.

CHAP. IX.

¶ Of Asia.

VNto it ioineeth Asia, which from the mouth of Canopus vnto the mouth of Pontus, after *Timosthenes* 2639 miles. From the coast of Pontus to that of Maxotis, *Eratosthenes* saith, is 1545 miles. The whole, together with Egypt vnto Tanais, by *Artemidorus* and *Isidorus*, taketh 8800 miles. Many seas there be in it, taking their names of the borderers; and therefore they shall be declared together with them. The next country to Africk inhabited, is Egypt, lying far within forth to the South, so far as the Æthyopians, who border vpon their backs. The nether part thereof the riuer Nilus, diuided on the right hand and the left, by his clasping doth bound and limit, with the mouth of Canopus from Africke, with the Pelusiack from Asia, and carrieth a space between of 170 miles. Whereupon, considering that Nilus doth so part it self, some haue reckoned Egypt among the Islands, so as it maketh a triangular figure of the land. And here it is that many haue called Egypt by the name of the Greeke letter Delta, Δ. The measure of it from the channell where it is but one, and from whence it beginneth first to part into skirts and sides, vnto the mouth of Canopus, is 146 miles; and to the Pelusiack 256: the vpmost part thereof bounding on Æthiopia, is called Thebais. Diuided it is into townships with seuerall iurisdicktions, which they call Nomos; to wit, Ombites, Phatuites, Apolopolites, Hermonhites, Thinites, Phanturites, Caprites, Tentyrites, Diospalites, Antæopolites, Aphroditopolites,

Alites, and Lycopolites. The country about Pelusium, these townships with their seuerall iurisdicktions, Pharboetites, Bubastites, Sethroites, & Tanites. The rest haue these following, the Arabick, the Hammoniack which extendeth to the Oracle of *Iupiter Hammon*, Oxyrynchites, Leontopolites, Atarrabites, Cynopolites, Hermopolites: Xoiters, Mendefins, Sebennites, Capastites, Latapolites, Heliopolites, Prosopites, Panopolites, Busirites, Onuphites, Sorites, Prenethu, Pthemphu, Naucratis, Nitrites, Gynæopolites, Menelaïtes, in the country of Alexandria. In like manner of Libya Marcotis. Heracleopolites is in the Island of Nilus, fiftie miles long, wherein also is that which they call *Hercules* his town. Two Arsinoites there be they, and Memphites reach as farre as two the head of Delta. Vpon it there do bound out of Africa the two Onasitæ. There be that change some names of these, and set down for them other iurisdicktions, to wit, Heroopolites, and Crocodilopolites. Between Arsinoites and Memphites there was a lake 250 miles about, or as *Mutianus* saith, 450, fifty paces deep, [i. 150 foot,] & the same made by mans hand, called the Lake Meridis, of a king who made it 72 miles from thence is Memphis, the castle in old time of the Ægyptian kings. From which to the Oracle of *Hammon* is twelue daies iournie, & so to the diuision of Nilus, which is called Delta, fifteen miles. The riuer Nilus rising from vnkowne springs, passeth thorow deserts and hot burning countries: and going thus a mighty way in length, is known by same onely, without armes, without wars, which haue discovered and found out all other lands. It hath his beginning, so far forth as *Tabæ* was able to search and find out, in a hill of the lower Mauritania, nor far from the Ocean, where a lake presently is seen to stand with water, which they call Nilides. In it are found these fishes called Alabeta, Coracini, Siluri, and the Crocodile. Vpon this argument & presumption Nilus is thought to spring from hence, for that the pourtraict of this source is consecrated by the said prince at Casaria, in Iseum, and is there at this day seene. Moreouer, obserued it is, that as the Snow or rain do satisfie the countie in Mauritania, so Nilus doth encrease. When it is run out of this lake, it scorneth to run through the sandy and ouergrown places, and hides himself for certaine daies iourny. And then soone after out of a greater lake, it breaketh forth in the country of the Massæyli, with Mauritania Casarienses, and lookes about viewing mens company, carrying the same arguments still of liuing creatures bred within it. Then once again being receiued within the sands, it is hidden a second time for twenty daies iourny, in the deserts as farre as to the next Æthiopes: and so soone as hee hath once againe espied a man, forth hee startes (as it should seem) out of that spring, which they called Nigris. And then diuiding Africk from Æthiopia, being acquainted, if not presently with people, yet with the frequent company of wild and sauage beasts, and making shade of woods as he goes he cuts through the midst of the Æthiopians: there surnamed Astapus, which in the language of those nations signifieth a water flowing out of darkenesse. Thus dasheth he vpon such an infinite number of Islands, and some of them so mighty great, that albeit he bare a swift streame, yet is he not able to passe beyond them in lesse space than 5 daies. About the goodliest and fairest of them Meroc, the channell going on the left hand is called Astabores, that is, the branch of a water coming forth of darkenesse: but that on the right hand Astufapes, which is as much as, lying hid, to the former signification. And neuer taketh the name of Nilus, before his waters meet againe & accord all whole together. And euen so was he aforetime named Siris, for many miles space: and of *Homer* altogether Ægyptis: and of others, Triton: here and there, and euer and anon hitting vpon Islands, and stirred as it were with so many prouocations: and at the last enclosed and shut within mountaines, and in no place he carries a rougher and swifter stream, whiles the water that he beareth, hastens to a place of the Æthiopians called Catadupi, where in the last fall among the rocks that stand in his way, he is supposed not to runne, but to rush downe with a mighty noise. But afterwards he becomes more milde and gentle, as the course of his streame is broken, and his violence tamed and abated, yea, and partly wearied with his long way: and so though with many mouths of his, he dischargeth himselfe into the Ægyptian sea. Howbeit at certaine set daies he swellth to a great height: and when he hath trauelled all ouer Egypt, hee overfloweth the land, to the great fertility and plenty thereof. Many and diuers causes of this rising and increase of his, men haue giuen: but those which carry the most probabilitie, are either the rebounding of the water, driuen back by the winds Etesia, at that time blowing against it, and driuing the sea withall vpon the mouths of Nilus: or else the Summer rain in Æthiopia by reason that the same Etesia bring clouds thither from other parts of the world. *Timæus* the

Mathematician, alledged an hidden reason therof, to wit, that the head and source of Nilus is named Phyalā, and the riuer it selfe is hidden, as it were drowned within certain secret trenches within the ground, breathing forth vapors out of reeking rockes, where it thus lieth in secret. But so soone as the sunne during those daies, commeth neere, drawne vp it is by force of heate, and so all the while he hangeth aloft, ouerfloweth: and then againe for feare he should be wholly deuoured and consumed, putteth in his head againe and lieth hid. And this happeneth from the rising of the dog starre Sicinus, in the Sunnes entrance into Leo, while the planet standeth plumbe ouer the fountaine afore said: for as much as in that climate there are no shadows to be seene. Many againe were of a different opinion, that a riuer floweth more abundantly, when the Sunne is departed toward the North pole, which happeneth in Cancer and Leo: and therefore at that time is not so easily dried: but when he is returned once againe back toward Capricorn and the South pole, it is drunke vp, and therefore floweth more sparely. But if according to *Timmā* a man would thinke it possible that the water should be drawne vp, the want of shadowes during those daies, and in those quarters, continueth still without end. For the riuer begins to rise and swell at the next change of the Moone after the Sun-steed, by little and little gently, so long as he passeth through the signe Cancer, but most abundantly when he is in Leo. And when he is entred Virgo, he falleth and setteth low againe, in the same measure as he rose before. And is cleane brought within his bankes in Libia, which is, as *Herodotus* thinketh, by the hundredth day. All the whiles it riseth, it hath been thought vnlawfull for kings or gouernours to faile or passe in any vessell vpon it, and they make conference so to do. How high it riseth, is known by markes and measures taken of certaine pits. The ordinary height of it is sixteen cubits. Vnder that gage the waters ouerflow not all. Aboue that stint there are a let and hinderance, by reason that the later it is ere they be fallen, and downe againe. By these, the feed time is much of it spent, for that the earth is too wet. By the other there is none at all, by reason that the ground is dry and thirsty. The prouince taketh good keepe and reckoning of both, the one as well as the other: For when it is no higher than 12 cubits, it findeth extreame famine: yea, and at 13 it feelleth hunger still, 14 cubits comforts their hearts, 15 bids them take no care, but 16 affoordeth them plenty and delicious dainties. The greatest flood that euer was knowne vntill this daies was 18 cubits, in the time of Prince *Claudius* Emperour: and the least, in the Pharsalian warre, against the death of *Pompey*: as if the very riuer by that prodigious token lothed to see the same. When at any time the waters seeme to stand and couer the ground still, they are let out at certaine sluices, or flood-gates drawne vp and set open. And so soon as any part of the land is freed from the water, straight waies it is sowed. This is the only riuer of all others that breatheth out nowind from it. The Seignory & dominion of *Egypt* beginneth at Syene, the frontier rowne of *Ethiopia*. For that is the name of a demy Island 100 miles in compasse, wherein are the Cerafæ vpon the side of Arabia: and ouer against it the 4 Islands Philæ, 600 miles from the partition of Nilus, where it began to be called Delta, as wee haue said. This space of ground hath *Artemidorus* deliuered, and withall, that within it were 250 townes. *Iuba* seteth down 400 miles. *Aristocreon* saith, that from Elephantis to the sea is 750 miles. This Elephantis being an Island, is inhabited beneath the lowest cataract or fall of water 3 miles, and aboue Syene 16: and it is the vtmost point that the *Egyptians* saile vnto, & is from Alexandria 586 miles. See how far the Authors aboue written, haue erred and gone out of the way: there meet the *Ethiopian* ships, for they are made to fold vp together, and carry them vpon their shoulders, so often as they come to those cataracts or downefalls afore said. *Egypt* ouer and aboue all other their boast and glory of antiquitie, brags that in the raigne of king *Amasis*, there were inhabited in it and peopled twenty thousand cities. And euen at this day full it is of them, such as they be, and of base account. Howbeit, that of *Apollo* is much renowned, as also neere vnto it another of *Leucatheia*, and **Diospolis* the great, the very fame that *Thebes*, famous for the 100 gates in it. Also, *Captos*, a great mart towne next to Nilus, much frequented for merchandise and commodities out of India and Arabia. Moreouer the towne of *Venus*, and another of *Iupiter*, & *Tentyris*, beneath which standeth *Abydus*, the royall seate of *Memnon*, and *Osiris* renowned for the temple there, seuen miles and an halfe distant from the riuer, toward *Lybia*. Then *Ptolemais*, *Panopolis*, and another yet of *Venus*. Also in the *Lybian* coast, *Lycon*, where the hills doe bound *Thebais*. Soone after, these townes of *Mercurie*, *Alabastron*, *Canum*, and that of *Hercules* spoken of before. After these, *Arfinoe*, and the aboue said *Memphis*, betweene which and

The cities
of *Egypt*.

A and the dioceffe *Arfinoetis*, in the *Lybian* coast, the towers called *Pyramides*, the *Labyrinth* built vp in the lake of *Mæris* without any iot of timber to it, and the towne *Crialon*. One more besides, standing within-forth and bounding vpon Arabia, called the towne of the Sunne, of great account and importance.

CHAP. X.

¶ Alexandria.

B Vt right worthy of praise is Alexandria, standing vpon the coast of the *Egyptian* sea, built by *Alexander* the Great on *Africke* side, 12 miles from the mouth of *Canopus*, neere to the lake *Mareotis*; which was before-time called * *Arapotes*. *Danochares* the Architekt (a * *Rachobes*) man renowned for his singular wit many waies) aid the modell and platforme therof by a subtil and witty deuise, for hauing taken vp a circuit of 15 miles for the city, he made it round like to a *Macedonian* cloke, full in the skirts, bearing out into angles and corners, as wel on the right hand as the left, so as it seemed to lie in folds and plaits; and yet euen then he set out one fift part of all this plot for the kings palace. The lake *Mareotis* from the South side, meeteth with an arme of the riuer *Nilus*, brought from out of the mouth of the said riuer called *Canopicus*: for the more commodious trafficke and commerce out of the firme ground and inland Continent. This lake containeth within it sundry Islands, and (according to *Claudius Cesar*) it is thirty miles ouer. Others say, that it lieth in length 40 *Schoeni*, and so, whereas euery *Schoene* is 30 stadia, it commeth by that account to be 150 miles long, and as many broad.ouer and besides, there be many goodly faire townes of great importance, standing vpon the riuer *Nilus* where he runneth, and those especially which haue giuen name to the mouthes of the riuer, and yet not to all those neither (for there be 11 of them in all, ouer and besides foure more, which they themselves call bastard mouthes) but to 7 of the principall: to wit, vpon that of *Canopus*, next vnto Alexandria; then *Bolbitinum*, and so forth to *Sebenniticum*, *Phatuiticum*, *Mendeficum*, *Taniticum*, and last of all *Pelusiacum*. Other cities there be besides, to wit, *Buros*, *Pharboetos*, *Leontopolis*, *Achribris*, *Isis* towne, *Bufiris*, *Cynophis*, *Aphrodites*, *Sais*, *Naucratis*, of which some thinke the mouth *Naucraticum* tooke the name, which they be that call *Heracleoticum*, preferring it before *Canopicum*, next vnto which it standeth.

D

CHAP. XI.

¶ Arabia [the Desert or Petraa.]

B Eeing once past that arme of the riuer *Nilus*, which entereth into the sea at *Pelusium*, you come into Arabia, confining vpon the red sea; and that other Arabia, so rich & odoriferous, and therefore renowned with the surname of *Happie*. As for this desert Arabia, possessed it is by the *Catabanes*, *Esbonites*, and *Srenite* Arabians: all barren and fruitlesse, saue whereas it meeteth with the confines of *Syria*, and setting aside the mountaine *Casius*, nothing memorable. This region confronteth the Arabians *Canchlei* on the East-side, and the *Cedraei* Southward, and they both confine together afterwards vpon the *Nabathæes*. Moreouer, 2 Baies there bee, the one called the gulfe of *Heroopolis*, and the other of *Elani*; both in the red sea on the coast of *Egypt*, 150 miles distant, betweene two townes, *Elana*, and *Gaza*, which is in our (*Mediterranean*) sea. *Agrippa* counterth from *Pelusium* to *Arfinoe*, a towne situate vpon the red sea, an hundred and fife and twenty miles. See how small a way lyeth betweene two Climates so different in Nature.

CHAP. XII.

¶ Syria, Palestine, Phœnice.

F Vpon the coast of the said Arabia, confineth *Syria*, a Region in times past, the chiefe and most renowned vpon earth, and the same distinguished by sundry names. For where it confineth vpon the Arabians, called it was *Palestina*, *Iurie*, *Coele-Syria*, and afterward, *Phœnice*. But go farther within the firme land, *Damascene*. Turne more still Southwards, it is named *Babylonia*. And the same, between the riuers *Euphrates* and *Tygris*, carrieth the name

K 2

of

The fifth Booke of

of Mesopotamia. Beyond the mountaine Taurus, it is Sophene; but on this side the hill, they call Comagene. The country beyond Armenia, is Adiabene, named before-time Assyria: but the marches of Syria, which confront Cilicia, is knowne by the name of Antiochia. The whole length of Syria, from the frontiers of Cilicia to Arabia, containeth 470 miles: the breadth between Seleucia Pieria, to Zeugina, a towne seated vpon Euphrates, taketh 175 miles. They that make a more subtil and particular diuision, would haue Phoenice to be enuironed with Syria. And first, as you come from Arabia, is the sea-coast of Syria, which compriseth in it Idumæa & Iudæa; then you enter into Phœnicia, and so into Syria again, when you are past Phœnicia. And within-forth farther into the country, Phœnicie is inclosed with Syria Damascena. All that sea yet, which beateth vpon that coast, beareth the name of the Phœnician sea. As for the nation it selfe of the Phœnicians, haue been highly reputed for their Science and learning, and namely, for the first inuention of letters, for their knowledge in Astrologie, nauigation, and martial skill. Being past Pelusium, you come to a city called Chabrizæ Castra to the mountain Casius, and the temple of *Iupiter Casius*: also the tombe of *Pompeius Magnus*; and last of all to the city Otracium. To conclude, from Pelusium to the frontiers of Arabia the Desert, [alongst the coast of Syria] are 65 miles.

CHAP. XIII.

¶ *Idumæa, Syria, Palestina, Samaria.*

Soon after beginneth Idumæa & Palestina, euen from the rising vp of the lake Sirbon, which some haue reported to carry a circuit of 150 miles. *Herodotus* saith, it is hard vnder the foot of the hill Casius: but at this day it is but a small lake. As for the towns there, they be Rhinocolura, and more within the land, Raphæa: also Gaza a port towne, and farther within, Anthedon, and the mountain Angoris. From thence you descend to the coast of Samaria, the free citie Ascalon, and Azotus; the two Iamnes, whereof the one is well within the land; and so forward to Ioppe, a towne in Phœnicia, which by report, is more antient than the deluge. Scituate it is vpon a hill, with a rocke before it, wherein are to be seen the tokens and reliques of *Lady Andromedæ*s prison where she was bound. Within a chappell there, the *Siren Decreto*, whereof the Poets tell such tales, is worshipped. Being past Ioppe, you meet with Apollonia: the towne of Strato, called also Cæsarea, founded by *K. Herod*: it beareth now the name of Prima Flauia, a colony there planted and endowed with priuiledges by *Vespassian* the Emperour. The bounds of Palestina be 180 miles from the confines of Arabia: and there entreth Phœnicie. Within-forth in the country, are the townes of Samaria, and Neapolis, which before-time was named Mamortha (or Maxbota.) Also Sabaste vpon the mountain, and Gamala, which yet standeth higher than it.

CHAP. XIII.

¶ *Iurie and Galilæa.*

A Boue Idumæa and Samaria, Iudæa spreadeth out far in length and breadth. That part of it which ioineth to Syria, is called Galilæa: but that which is next to Syria and Egypt, is named Peræa, [i. beyond Iordan.] Full of rough mountaines dispersed here and there: and seuered it is from other parts of Iury, by the riuer Iordan. As for the rest of Iudæa, it is diuided into ten gouernments or territories, called Toparchies, in this order following: to wit, that of Hiericho, a vaile richly planted with Date trees: Emmaus, well watered with fountaines: Lydda, Ioppica, Accrabadena, Gophnitica, Thamnitica, Betholene, Tephene, and Orine, wherein stood Ierusalem, the goodliest citie of all the East parts, and not of Iury onely. In it also is the principalitie Herodum, with a famous towne of that name.

CHAP. XV.

¶ *Iordane the Riuer.*

The riuer Iordan springeth from the fountaine Paneades, which gaue the Symame to the citie Cæsarea, whereof we will speake more. A pleasant riuer it is, and as the site of the country will permit and giue leaue, winding and turning in and out, seeking as it were for loue

Plinies Naturall History.

A loue and fauour, and applying it selfe to please the neighbor inhabitants. Full against his will, as it were, he passeth to the lake of Sodom, Asphaltites, that ill-fauored and cursed lake: and in the end falleth into it, and is swallowed vp of it, where amongst those pestilent and deadly waters, he loseth his owne that are so good and wholesome. And therefore to keep himselfe out of it as long as he possibly could, vpon the first opportunity of any vallies, he maketh a lake, which many call Genesara, which is 16 miles long, and 6 broad. The same lake is enuironed with diuers faire and beautifull townes; to wit, on the East side, with Iulias and Hippo; on the South, with Tarichea, of which name, the lake by some is called Tarichion; and on the West, with Tiberias, an healthfull place for the baines there of hot waters.

CHAP. XVI.

¶ *Asphaltites.*

A Asphaltites, or the lake of Sodom, breedeth and bringeth forth nothing but Bitumen; and thereupon it tooke the name. No liuing body of any creature doth it receiue into it: buls and camels swim and stoe aloft vpon it. And hereupon ariseth that opinion which goeth of it, That nothing there wil go downe and sink to the bottome. This lake in length exceedeth 100 miles, 25 miles ouer it is at the broadest place, and six at the narrowest. On the East, the Arabian Nomades confront it; and on the South side, Macharus regardeth it: in time past, the second fortresse of Iudæa, and principall next to Ierusalem. On the same coast, there is a fountain of hot waters, wholesome and medicinable, named Callirhoe, and good against many diseases.

CHAP. XVII.

¶ *The people Esseni.*

A Long the West coast inhabit the Esseni. A nation this is, liuing alone and solitarie, and of all others throughout the world most admirable and wonderfull. Women they see none: carnal lust they know not; they handle no money, they lead their life by themselves, and keepe company onely with Date trees. Yet neuerthelesse, the country is euermore well peopled, for that daily numbers of strangers resort thither in great frequencie from other parts: and namely, such as be weary of this miserable life, are by the surging waues of frowning fortune driuen hither, to fort with them in their manner of liuing. Thus for many thousand yeares [a thing incredible, and yet most true] a people hath continued without any supply of new breed and generation. So mightily increase they euermore, by the wearisome estate & repentance of other men. Beneath them stood sometime Engadda, for fertilitie of soile and plenty of Date-tree groues, accounted the next city in all Iudæa, to Ierusalem. Now, they say, it serueth for a place only to inter their dead: beyond it, there is a castle or fortresse scituate on a rock, and the same not far from the lake of Sodom Asphaltites. And thus much as touching Iudæa.

CHAP. XVIII.

¶ *Decapolis. [i. Cæle-Syria.]*

E Here ioyne to it on Syria side, the region Decapolis, so called of the number of towns and cities in it. Wherein, all men obserue not the same, nor make like account: howbeit most men speake of Damascus and Oporos, watered with the riuer Chrysorrhœa. Also, Philadelphia, renowned for the fruitfull territory about it. Moreouer, of Scythopolis, taking name of the Scythians there planted: and before-time Myfa, so named of Prince or Father *Bacchus*, by reason that his nource there was buried. Also Gadara, scituate on the riuer Hieromias, running euen before it. Besides, the aboue-named Hippos Dios. Likewise Pella, enriched with the good fountaines: and last of all, Galaza and Canatha. There lie betwene and about these cities, certaine Royalties called Triarchies, containing euery one of them as much as an whole country: and reduced they be as it were into seuerall countries; namely, Trachonitis Panias, wherein standeth Cæsarea, with the fountain aboue-said, Abila, Arca, Ampeloessa, and Gaber.

Returne now we must to the sea-coast of Phœnice. A riuer runneth there called Crocodilon, whereupon stood a towne in times past bearing the name. Also there remain in those parts the bare reliques still of cities, to wit, Dorum, Sycaminum, the cape or promontory Carmelum; and a towne vpon the hill so named; but in old time called Ecbatana. Neere therto Getta and Iebba; the riuer Pagida or Pelus, carrying chrystall glasse with his sands vpon the shore. This riuer commeth out of the meere Ceudeuia, from the foot of mount Carmel. Neere vnto it is the city Ptolemais, erected in forme of a colony, by *Claudius Cesar*; in ancient time called Are. The towne Ecdippa, and the cape Album. Then followes the noble citie Tyrus, in old time an Island, lying almost 3 quarters of a mile within the deepe sea; but now, by the great trauell and deuises wrought by *Alexander the Great* at the siege thereof, ioyned to the firme ground: renowned, for that out of it haue bene three other cities of ancient name, to wit, Lep-tis, Vtica, and that great Carthage, which so long stroue with the Empire of Rome for the monarchy and dominion of al the whole world: yea, and Gades, diuided as it were from the rest of the earth, were peopled from hence. But now at this day all the reputation and glory thereof, stands vpon the die of purple & crimson colors. The compasse of it is 19 miles, so ye comprise Palætyrus within it. The very towne it selfe alone, taketh vp 22 stadia. Neere vnto it are these townes, Luhadra, Sarepta, and Ornython: also Sydon, where the faire and cleer glasse be made, and which is the mother of the great citie Thebes in Boeotia.

Behind it, beginneth the mount Libanus, and for 1500 stadia reacheth as farre as to Smyrna, whereas Coele-Syria takes the name. Another promontory there is as big ouer-against it, called Antilibanus, with a vallie lying betweene, which in old time ioyned to the other Libanus with a wall. Being past this hill, the region Decapolis sheweth it selfe to you within-forth, called Decapolis; and the aboue-named Tetrachies or Realmes with it, and the whole largeness that Palestine hath. But in that coast and tract still along the foot of the mount Libanus, there is the riuer Magoras: also the colonie Berytus, called Fœlix Iulia. The towne Leontos, the riuer Lycos: also Palæbyblos, [i. Byblos the old.] Then ye come vpon the riuer Adonis, and so to these townes, Byblos [the new,] Botrys, Gigarta, Trieris, Calamos, and Tripolis, vnder the Tyrians, Sydonians, and Aradians. Then meet you with Orthosia, and the riuer Eleutheros. Also these townes, Simyra, Marathos; and ouer-against, Aradus, a towne of seuen stadia: and an Island lesse than a quarter of a mile from the Continent. When you are once past the countrie, where the said mountaines doe end, and the plaines lying betweene, then beginneth the mount Bargylis: and there, as Phœnice endeth, so begins Syria againe. In which countrie are Carne, Balanea, Paltos, and Gabale: also the Promontorie, whereupon standeth the free city Laodicea, together with Diospolis, Heraclea, Charadrus, and Posidium.

Go forward in this tract, and you shall come to the cape of Syria Atiochena: within-forth is seated the noble and free citie it selfe Antiochena, surnamed Epidaphne: through the midswhereof runneth the riuer Orontes. But vpon the very cape, is the free citie Seleucia, named also Pieria.

Aboue the citie Seleucia, there is another mountaine named Casius, as well as that other, which confronteth Arabia. This hill is of that heighth, that if a man be vpon the top of it in the darke night season, at the reliefe of the fourth watch, he may behold the Sunne arising

A sing. So that with a little turning of his face and body, hee may at one time see both day and night. To get vp by the ordinary high-way to the very pitch of it, a man might fetch a compas of 19 miles; but climbe directly vpright it is but 4 miles. In the borders of this country runs the riuer Orontes, which ariseth between Libanus and Antilibanus, neere to Heliopolis. Then the towne Rhosfos appeares: and behind it, the streight passages and gullers betwixt the mountaines Rhotij and Taurus, which are called Portæ Syriae. In this tract or coast stands the town Myriandros, the hill Avanus (where is the towne Bomilæ, which separateth Cilicia from the Syrians).

It remaineth now to speake of the townes and cities in the midland parts within the firme land: and to begin with Coele Syria, it hath in it Apamia, separated from the Nazerines tetrarchy by the riuer Marfia: likewise Bambyce, otherwise called Hierapolis; but of the Syrians, Magog. There is honored the monstrous idoll of the Meermaid, Atargatis, called of the Greeks Decreto. Also Chalcis, with this addition, Vpon Belus: from which the region Chalcidene, most fertile of all Syria, taketh name. Then haue you the quarter Cyrhistica, with Cirrus, Gazatæ, Gindarenes, and Gabenes. Moreouer, two Tetrarchies, called Granucomatae. Moreouer, the Hemifenes, Hylates, the Ituræans country (and principally those of them who are named Betarrani) and the Mariammitanes. The Tetrarchie or Principalitie named Mam-milca, the city Paradisus, Pagra, Pinarites, and two Seleucia, besides the aboue named, one called, Vpon Euphrates; and the other, Vpon Belus: and last of all, the Carditenses. The rest of Syria hath these States (besides those which shall be spoken of with the riuer Euphrates) the Arethusians, Beræenses, and Epiphanenses: and Eastward, the Laodicenes, namely those who are entituled, Vpon Libanus: the Leucadians and Larissæans: besides 17 Tetrarchies reduced into the forme of realmes, but their names are barbarous.

And here me-thinks is the fittest and meetest place to speake of Euphrates. The source of it, by report of them that saw it last and neereest, is in Caranitis, a state vnder the government of Armenia the greater: and those are *Domitius* and *Corbulo*, who say, that it springeth in the mountaine Aba. But *Licinius Mutianus* affirmeth, that it issueth from vnder the foot of the mountaine which they call Capotes, 12 miles higher into the countrey than is Simyra: and that in the beginning it was called Pyxirates. It runs first directly to Derxene, and so forth, to Ana also, excluding the regions Armeniæ, the greater as well as the lesse, from Cappadocia. The Dastufæ from Simyra are 75 miles: from thence it is nauigable to Pæstona, 50 miles: from it to Melitene in Cappadocia, 74 miles. So forward to Elegia in Armenia, ten miles; where he receiueth these riuers, Lycus, Arsanias, and Arsanus. Neere to Elegia he meeteth afront with the hill Taurus: yet stayeth he not there, but preuaileth a pierceth thorow it, although it beare a bredth there of 12 miles. At this entry where he breaketh thorow the hill they call him Omiras, and so soon as he hath made way and cut thorow it he is named Euphrates. Being past this mountaine, he is full of rocks and very violent: howbeit he passeth through the country of the Moeri, where he carrieth a stream of 3 Schoenes bredth, where he parts Arabia on the left hand, from Comagene on the right. And neuer the lesse, euen therewheras he conquereth and getteth the vpper hand of Taurus, he can abide a bridge to be made ouer him. At Claudiopolis in Cappadocia he courseth Westward: and now the mountain Taurus, though resisted and overcome at first, impeacheth and hindereth him of his way, and notwithstanding (I say) he was ouermatched and dismembred one piece from another, he gets the better of him another way, breaking his course now, and driuing him perforce into the South. Thus Nature seems to match the forces of these two champions equally in this manner, That as Euphrates goes on stil without stay as far as he will, so Taurus will not suffer him yet to run what way he wil. Now when these Cata-racts and downfalls of the riuer are once past, it is nauigable againe, and forty miles from that place

place standeth Samosata the head city of Comagena. Now hath Arabia beside the townes afore said, Edeffa, sometime called Antiochea, Callirrhoe, taking name of the fountain: and Carra, so famous and renowned for the defeature there of *Craffus* and his army. Hereunto ioine the gouernment and territorie of Mesopotamia, which also taketh the first beginning from the Assyrians, in which stand the townes Anthemusa and Nicephorium. Hauing passed this country, ye straitway enter vpon the Arabians called Rhetavi, whose capitall city is Singara. Now to returne to Samosata, from it in the coast of Syria, the riuer Marfyas runneth into Euphrates. As Gingla limiteth Comagene, so the land of the Meri beginneth there. The townes Epiphania and Antiochia haue the riuer running close to them, and hereupon they haue this addition in their names, Standing vpon Euphrates. Zenyma likewise, 72 miles from the Samosata, is innobled for the passage ouer Euphrates: for ioined it is to Apamia, right against, by a bridge, which *Seleucus* the founder of both caused to be made. The people that ioine hard to Mesopotamia be called Rhoali. As for the townes of Syria which be vpon this riuer, are Europum, Thapsicum in times past, at this present Amphipolis; and last of all the Arabian Scenitere. Thus passeth Euphrates, as far as to the land Vra, where turning his course to the East, hee leaueth behinde him the Desarts of Palmyra in Syria, which reach to the city Petra, and to the country of Arabia Foelix.

CHAP. XXV.

¶ *Palmyra.*

THe noble city Palmyra is passing well seated, as well for the riches of the soile, as for abundance of waters, which imbelish and set out the country on euery side. As rich and long as it is, the territory all about is inuironed and inclosed with bars of sand. And as if Nature had a desire to exempt it from all other lands to liue apart in peace, shee hath set it iust in the middest and confines, between two puissant and mighty empires, to wit, the Romans and Parthians: for there is not so soone any war proclaimed between those two States and Monarchies, but at first they haue on both sides a regard of it as a neutre. It is from Seleucia of the Parthians, namely that vpon Tigris, 537 miles: and from the next port or coast of Syria, 252: and from Damasco 27 neerer.

CHAP. XXVI.

¶ *Hierapolis.*

Beneath the desarts and wildernesse of Palmyra lieth the country Stelendena, wherein are the cities named at this day Hierapolis, Berœa, and Chalcis. Beyond Palmyra also, Hemesa taketh vp some part of thole said desarts: and likewise Elutium, neerer to Petra by one halfe than is Damascus. And next to Asura standeth Philiscum, a towne of the Parthians vpon Euphrates: from which by water it is a iourney of ten daies to Seleucia, and from thence as many likewise to Babylon: for Euphrates, 83 miles from Zeugma, about the village Massice, diuideth it selfe into two armes. On the left side he passeth into Mesopotamia, euen thorow Seleucia, and about it enteth into the riuer Tygris, which runneth hard by: but on the right hand he carieth a current in his chanell toward Babylon, the chiefe city sometime of Chaldaea, and passing through the midst thereof, as also of another called Otris, he parts asunder into sundry lakes and meeres. And there an end of Euphrates. He riseth and falleth at certain times after the order of Nilus: yet some little difference there is betweene them in the manner, for he ouerfloweth Mesopotamia when the Sun is in the 20 degree of Cancer, and begins againe to diminish and flake when the Sun is past Leo, and newly entred into Virgo: so as in the 29 degree of Virgo he is downe againe, and come to his ordinary course.

CHAP. XXVII.

¶ *Cilicia, and the nations adioyning, to wit, Isaurica, Homonades, Pisidia, Lycaonia, Pamphylia, the mountaine Taurus, and Lycia.*

BVt time it is to returne now to the coasts of Syria, and to Cilicia that confronts it. Where in the first place we meet with the riuer Diaphanes, the mountain Crocodilus, the streights and

A and passages of the mount Amanus: more riuers also, to wit, Andricon, Pinarus, and Lycus, as also the gulfe Issicus. The towne Issa standeth vpon it, then come we to Alexandria to the Riuer Chlorus, the free towne Æge, the riuer Pyramus, and the streights in the entrance to Cilicia. Beyond them we encounter the townes Mallos & Magarfos: as for Tarfos it is more within the country. From this towne we enter vpon the plaines of Aleij, and so forward to these townes, Cassipolis, and Mopsum, which is free, and standeth vpon the riuer Pyramus; Thynos, Zephyrium, and Anchialæ. On forward you shall haue the riuers Saros and Sydnus, which runs through: Tarfus a free city far from the sea: then are ye in the country Celcuderitis, together with the capitall towne thereof. And anon ye shall set foot in a place called Nymphæum, and Solce Cilicij now Pompeiopolis, Adana, Cibira, Pinara, Pedalie, Halix, Arfinoe, Tabæ, & Doron: and neere the sea side you shall finde a towne, an harbour, and a caue, named all Corycos. Soon after, the riuer Calycadnus. The cape Sarpedon, the townes Olme and Mylæ, the Cape and towne both of *Venus*, the very next harbor from whence men passe into the Isle Cypres. But in the maine land you shall finde these townes, Myanda, Anemurium, Coracesium: and the riuer Melas, the antient bound that limiteth Cilicia. Farther within-forth are to be spoken of, the Anazarbenes, at this day Cæsar Augustani; Castabla, Epiphania, before-time Eniandos, Eleusa, and Iconium: Seleucia vpon the riuer Calicadmus, firnamed also Trachiotis, a city remoued backward from the sea, where it was called Hormia. Furthermore, within the country, the riuers Liparis, Bombos, and Paradisus. Last of all, the mountaine Iubarus. All Cosmographers haue ioyned Pamphylia to Cilicia, and neuer regarded the Nation of Isaurica, being a country by it selfe, hauing within it these towns, Isaura, Clibanus, Lalassis. And it thouts down to the sea side, full vpon the frontiers of the country Anemurium aboue said. In like sort, as many as haue set forth maps and descriptions of the world, had no knowledge at all of the Nation Homonades confining vpon it, notwithstanding they haue a good towne within it, called Homona. Indeed the other fortresses, viz. 44, lie hidden close among the hollow vallies & hills of that country. There inhabit the mountainers ouer their heads, the Pisidians, sometime called Sobymi, whose chiefe colony is Cæsaria, the same that Antiochia. Their townes be Oroanda and Sagaleffos. This nation is inclosed as it were within Lycaonia, lying within the iurisdiction of the lesse Asia, and euen so together with it, the Philomelians, Timbrians, Leucolithi, Pelti, and Hyrienses resort thither for law and iustice. There is a gouernment or Tetrarchy also, out of the quarter of Lycaonia, on that side that bordereth vpon Galatia, vnto which belong 14 States or cities, the chiefe whereof is called Iconium. As for the nations of Lycaonia, those of any note be, Tembasa vpon Taurus, Sinda in the confines of Galatia, and Cappadocia: But on the side thereof aboue Pamphylia, ye meet with Mylæ, descended in old time from Thrace, who haue for their head city Aricanda. As for Pamphylia, it was in antient time called Mopsopia. The Pamphylian sea ioine to the Cilician. The townes scituare vpon that coast, be Side, Aspendus on the hill, Plantanius, and Perga. Also the cape Leucolla, the mount Sardemisus, the riuer Eurymedon, running hard by Aspendum. Moreouer, Cataraetes the riuer, neere vnto which stand Lyrnessus and Olbia; and the vtmost towne of all that coast Phaselis. Fast vpon it lieth the Lycian sea, and the nation of the Lycians, where the sea makes a huge great gulfe.

EThe mountaine Taurus likewise, confining vpon the Levant sea, doth limit Lycia and Cilicia, with the promontorie Chelidonium. This Taurus is a mighty mountain, and determineth as a iudge an infinite number of nations. So soone as he is risen from the coast of the East Indian sea hee parteth in twaine, and taking the right hand passeth Northward, and on the left hand Southward, somewhat bending into the West: yea, and diuiding Asia through the middest, and (but that he meeteth with the seas) ready to stop and dam vp the whole earth besides. He retireth back therefore, as being curbed, toward the North, fetching a great circuit, and so making his way, as if Nature of purpose opposed the seas east soones against him to bar him of his passage, of one side the Phœnician sea, of another the great sea of Pontus, the Caspian & Hyrcanian seas likewise; and full against him the lake Mœotis. And notwithstanding all these bars, within which he is pent, twined, and wrested, yet maketh he means to haue the mastery, and get from them all: and so winding byas he passeth on, vntill he encounter the Rhipæan hills, which are of his owne kinde: and euer as he goeth is entituled with a number of new names. For he is called Imaus where he first beginneth: a little forward, Emodus, Paropamisus, Circius, Canibades, Parphariades, Choatras, Oreges, Oroandes, Niphates, and then Taurus. Neuertheless where

where he is highest, and as it were ouer-reacheth himselfe, there they name him Caucasus : G where he stretcheth forth his armes like as if he would now and then be doing with the seas, he changeth is name to Sarpedon, Coraceus, and Cragus : and then once again he takes his former name Taurus, euen where he opens and makes passage as it were to let in the world. And yet for all these waies and ouertures he claimeth his owne stile, and these passages are called by the names of gates, in one place Armenia, in another Caspia, and sometimes Cilicia. Ouer and besides, when he is broken into parcels, and escaped far from the sea, he taketh many names from diuers and sundry nations on euery side: for on the right hand he is termed Hyrcanus, and Caspius: on the left, Pariedrus, Moschicus, Amazonicus, Coraxicus, and Scythicus: and generally throughout all Greece, Ceraunius.

To returne then to Lycia, being past the foresaid cape there, Chelidonium, ye come to the towne Simena, the hill Chimæra, which casteth flames of fire euery night, the city Hephæstium, where the mountains about it likewise oftentimes are known to burne. Sometimes the city Olympus stood there, but now nothing to be scene but mountaines, and amongst them these townes, Gage, Corydalla, and Rhodiopolis. On the sea coast, the city Lymira vpon a riuer, to which Aricandus runneth: also the mountaine Massyrites, the cities Andriara and Myra. Also these townes, Apyre, and Antiphellos, which sometime was called Habessus; and more within-forth in a corner, Phellus. Then come ye to Pyrrha, and so to Xanthus, 15 miles from the sea, and to a riuer likewise of that name. Soon after ye meet with Patara, before-time named Sataros, and Sydinia seated vpon an hill, and so to the promontorie Ciagus. Beyond which ye shall enter vpon a gulfe as big as the former, vpon which standeth Pinara and Telmessus, the utmost bound in the marches of Lycia. In antient time Lycia had in it 60 townes, but now not aboue 36. Of which the principall and of greatest note, besides the aboue named, be Canæ, Candiba, where is the famous wood Oenium, Podalia, Choma, vpon the riuer Adefa, Cyane, Ascandalis, Amelas, Noscopium, Tlos, and Telanorus. As for the midland parts of the maine, you shall finde Chabalia, with three townes thereto belonging, Oenonda, Balbura, and Bubon.

When you are beyond Telmessus you meet with the Asiaticke sea, otherwise called Carpathium, and this coast is properly called Asia. Agrippa hath diuided it in two parts, whereof the one by his description confronteth vpon Phrygia and Lycaonia Eastward: but on the West side it is limited with the Ægean sea. Southward it bounds vpon Egypt, and in the North vpon Paphlagonia: the length thereof by his computation is 470 miles, the bredth 300. As for the other he saith, That Eastward it confineth vpon Armenia the lesse: Westward vpon Phrygia, Lycaonia, and Pamphylia: on the North it butteth vpon the prouince or realm of Pontus, and on the South side is inclosed with the Pamphylian sea. He addeth moreouer, that it containeth 575 miles in length, and 325 in bredth. The next coast bordering thereupon is Caria: and when you are past it, Ionia, and beyond that, Æolis. As for Caria it incloseth Doris in the mids, enuironing it round on euery side, as far as to the sea. In it is the Cape Pedalium, also the riuer Glaucus, charged with the riuer of Telmessus. The townes of any respect be Dædala and Crya, peopled only with banished persons. Therein you finde the riuer Axoum, and the towne Calydua.

CHAP. XXVIII.

¶ The riuer Indus.

THE riuer Indus, arising from the mountaines of the Cybirates, receiueth into it 60 other running riuers, maintained with springs, of other small riuers and brookes fed with land floods, aboue 100. Vpon it standeth the free towne Caunos, and a little off, Pynos. Soon after ye meet with the port Cressa, ouer against which is discovered the Island Rhodus, within the kenning of twenty miles. Being past that haven, you shall enter vpon the plaine Loryma, vpon which are seated the townes Tyfanusa, Tarydion, Larymna. Then meet you with the gulfe Thymnias, and the cape Aphrodisias: and on the other side of it the towne Hyda, and another gulf Schœnus. Then followes the country Bubassus, wherein stood in antient time, the towne Acanthus, otherwise called Dulopolis. Also vpon the cape there, the free city Gnidos, Triopia, then Pegusa, called likewise Stadia. Beyond which you enter into the Countrey of Doris,

A Doris. But before we passe farther, meet it were to speake of those cities and States which are in the midland countrie, and which lie behind, and namely of one, named Cibiratica. The towne it selfe is in Phrygia, and to it resort for law and iustice 25 cities.

CHAP. XXIX.

¶ Laodicia, Apamia, Ionia, Ephesus.

THE principall citie in those quarters (of the Cibirites) is Laodicia. Seated it is vpon the riuer Lycus: and yet there run hard to the sides thereof two other riuers, Asopus, and Caper. This citie in times past was called Diospolis, & afterwards Rhoas. The other nations belonging to that iurisdiction of the Cibirates, worth the naming, by the Hydrelites, Themifones, and Hierapolites. Another countie court or towne of resort there is, which taketh the name of Synnada: and to it repaire for iustice, the Licaonians, Appians, Encarpenes, Dorylaei, Midæi, Iulienfes, and other states of no great reckoning, sitreene. A third Seigneurie or Shire there is that goes to Apamia, which in old time was called Celæna, and afterwards Ciboron: scituate it is at the foot of the hill Signia, enuironed with three riuers, Marfias, Obrima, and Orga, falling all into the great riuer Meander. As for the riuer Marfias (which a little from his spring was hid vnder the ground, whereas *Marsyas* the musitian stroue with *Apollo* in playing vpon the flute) sheweth himselfe again in Aulocrenæ, for so is the vallie called, ten miles from Apamia, as men trauell the high way to Phrygia. Vnder this iurisdiction, we should dowell to name the Metropolitans, Dionysopolites, Euphorbenes, Acmoneses, Peltenes, and Silbians. There are besides to the number of 60 small towns of no account. But within the gulfe of Doris there stand Leucopolis, Amaxites, Eleus, and Euthenæ. Moreouer, other townes of Caria, Pitium, Eutania, and Halicarnassus. And to this citie were annexed, as subiect and homages by *Alexander* the great, six other townes, namely, Theangela, Sibde, Medmossa, Euranium, Pedasium, and Telnessum: which townes are inhabited betwene the two gulfs, Ceramicus, and Iasius. From thence yee come to Myndus, and where sometime stood Palæmindus, Neapolis, Nariandus, Carianda, the free citie Termera, Bergyla, and the town Iasius which gaue the name to the gulfe Iasius. But Caria is most renowned & glorious for the places of name within it in the firme land: for therein are these cities, to wit, Mylasa free, and Antiochia, now standing where sometime were the townes, Seminethos, and Cranaos: and enuironed now it is about with the riuers Meander, and Mossinus. In the same tract stood sometime Mæandropolis also. There is besides, the citie Eumenia, vpon the riuer Cludrus: the riuer Glaucus: the towne Lycias and Orthasia. The tract or marches of Berecinthus, Nyfa, Trallais, which also is named Euanthia, Seleucia, and Antiochia, which is scituate vpon the riuer Eudone that runneth hard by it, and Thebanis which passeth quite through it. Some there bewho report, that the dwarfes called Pigmaei, sometime there dwelt. In which region besides, were these townes, Thydonos, Pyrrha, Eurome, Heraclea, Amyzon, and the free citie Alabanda, whereof that shierewicke or iurisdiction tooke name. Also the free towne Stratonicea, Hynidos, Ceramius, Troæzene, and Phorontis. Yea there be nations farther remote, that resort thither to pleade and haue iustice in that court: namely, the Othroniens, Halydiens, or Hyppines, Xystianes, Hydissenfes, Apolloniates, Tapezopolites, and of free condition the Aphrodisians. Ouer and besides these, there are Cosinus, & Harpasa, scituate vpon the riuer Harpafus, which also ran vnder Trallicon, when such a towne there was. As for the countrey of Lydia, watered it is in many places with the recourse of Mæanders streame, winding and turning in and out, as his manner is: and it reacheth aboue Ionia: confining vpon Phrygia in the East, vpon Misa in the North, and in the South side enclosing all the countrey of Caria. This Lydia was sometimes named Mœnia. The capitall citie of this region, is Sardis, seated vpon the side of the mountaine Tmolus, called before-time Timolus, a hill well planted with vineyards. Moreouer, renowned is this countrey for the riuer Pactolus issuing forth of this mountaine, which riuer is called likewise Chrysothoas: as also for the fountain Tarnes. The city abouesaid, was commonly by the Mœonians called Hyde, famous for the meer or lake of Gyges. Al that iurisdiction is at this day called Sardinia. Thither resort besides the abouenanied, the Caduēnes, descended from the Macedonians; the Lorenens, Philadelphenes, yea and the very Mœonians, such as inhabite vpon the riuer Cogamus at the foot of Tmolus; and the Tripolitans who together with the Antonopolites, dwell vpon the

the riuér Mæander. Furthermore, the Apollonos-Hieritæ, Myformolites, and others of small reputation.

Ionia beginneth at the gulfe Iasius, and all the coast thereof is very full of creekes and reaches. The first gulfe or creeke therein is Basilicus; and ouer it the cape Posideum, and the town called somtime, the Oracle of Branchidæ, but at this day, of Apollo Didymæus, 20 stadia from the sea side. Beyond which 180 stadia, standeth Milletus, the head citie of Ionia, named in time past Lelegeis, Pityusa, and Anaſtoria. From which, as from a mother citie, are descended more than eighty others, all built along the sea coast by the Milleſians. Neither is this city to be defrauded of her due honour, for bringing forth that noble citizen *Cadmus*, who deuised and taught first to write in Prose. Concerning the riuér Mæander, it issueth out of a lake at the foot of the mountain Aulocrene; and passing vnder many townes, and filled still with as many riuers running into it, it fetcheth such windings to and fro, that oftentimes it is taken for to run back againe from whence it came. The first countrie that it passeth through, is *Apamia*: and from thence it proceedeth to *Eumenitica*, and so forward through the plaines *Beryllitici*. Last of all, hee commeth gently into *Caria*, and when hee hath watered and ouerflowed all that land with a most fat and fruitful mud that he leaueth behind him, about ten stadia from *Miletus*, he dischargeth himselfe into the sea. Neer to that riuér, is the hill *Latmus*: the citie *Heraclea*, surnamed *Caryca*, of a hill of that name: also *Myus*, which as the report goeth, was the first citie founded by the Ionians after their arriual from *Athens*, *Naurochum*, and *Pyrene*. Also vpon the sea coast, the towne called *Trogilia*, and the riuér *Gessus*. Moreouer, this quarter all the Ionians resort vnto in their deuotion, and therefore named it is *Panionia*. Neere vnto it was built a priueledged place for all fugitiues, as appeareth by the name *Phygela*: as also the town *Maraſium* stood there sometime: and aboue it, the renowned citie *Magnesia*, surnamed, Vpon Mæander; of the foundation of that other *Magnesia* in *Theſſalie*. From *Ephesus* it is 15 miles; and from *Trallais* thither, it is three miles farther. Beforetime, called it was *Theſſaloce*, & *Androlitia*: and being otherwise situate vpon the strond, it tooke away with it other Islands called *Deraſides*, and ioine them to the firme land from out of the sea. More within the maine standeth *Thyatira* (in old time called *Pelopia* and *Euhippa*) vpon the riuér *Lycus*. But vpon the sea coast, yee haue *Manteium*, and *Ephesus*, founded in times past by the *Amazones*. But many names it had gone through before, for in time of the *Troiane* war, *Alopes* it was called: soone after, *Ortygia*, and *Morges*; yea, and it took name *Smyrne*, with addition of *Trachæa*, [i. rough] *Samornium*, and *Ptelea*. Mounted it is vpon the hill *Pione*, and hath the riuér *Cayſtrus* vnder it, which commeth out of the *Cilbian* hills, and bringeth downe with it many other riuers, and principally is maintained and enriched with the lake *Pegaseum*, which dischargeth it selfe by reason of the riuér *Phyrites* that runneth into it. With these riuers he bringeth downe a good quantitie of mud, whereby he increaseth the land: for now already a good way within the land, is the Island *Syrie*, ioined to the continent. A fountain there is within the citie, called *Callipia*; and two riuers (height both *Selinus*) comming from diuers parts, enuiron the temple of *Diana*. After you haue been at *Ephesus*, you come to another *Manteium*, inhabited by the *Colophonians*: and within, the country *Colophon* it selfe, with the riuér *Halesus* vnder it. Then meet you with the noble temple of *Apollo Clarius*, and *Lebedos*. And in this quarter sometime was to be seen the towne *Notium*. The promontory also *Coryceon* is in this coast: and the mountaine *Mimas*, which reaches out 250 miles, and endeth at length in the plaines within the continent that ioine vnto it. This is the place, wherein *Alexander* the Great commanded a trench seven miles long and an halfe to be cut through the plain, for to ioine two gulfes in one, and to bring *Erythree* and *Mimas* together for to be enuironed round therewith. Neere this city *Erythree* were sometimes the townes, *Pteleon*, *Helos*, and *Dorion*: now, there is the riuér *Aleon*, and the cape *Corineum*: vpon the mount *Mimas*, *Clazomene*, *Parthenia*, and *Hippi* called *Chytophria*, hauing bene sometime Islands: the same, *Alexander* caused to be vnted to the firme land for the space of two stadia. There haue perished within-forth and bene drowned, *Daphnus*, *Hermesia*, and *Sipylum*, called before-time *Tantalus*, notwithstanding it had bene the chiefe citie of *Mæonia*, situate in that place, where now is the meere or lake *Sale*. And for that cause *Archæopolis* succeeded in that preeminence, and after it *Colpe*, and in stead thereof *Lebade*. As you returne from thence toward the sea side, about twelue miles off, you come vpon the citie *Smyrna*, built by an *Amazonite*, but repaired and fortified by *Alexander* the Great. Situate

A tuar it is pleasantly vpon the riuér *Melis*, which hath his head and source not far off. The most renowned hills in *Asia* for the most part, spread themselves at large in this tract, to wit, *Maſtusia*, on the back side of *Smyrna*; and *Termetis*, that meets close to the foot of *Olympus*. This hill *Olympus* endeth at the mountain *Tmolus*; *Tmolus* at *Cadmus*; and *Cadmus* at *Taurus*. When you are past *Smyrna*, you come into certain plains, occasioned by the riuér *Hermus*, and therefore adopted in his name. This riuér hath his beginning neer to *Doryleus* a city of *Phrygia*, and takes into it many other cities; & principally *Phryge*, which giues name to the whole nation, and diuides *Phrygia* and *Caria* asunder. Moreouer *Lyllus* & *Crios*, which also are big and great by reason of other riuers of *Phrygia*, *Myſia*, and *Lydia*, which enter into them. In the very mouth of this riuér stood sometime the towne *Temnos*; but now in the very vtmost nouke of the gulfe certain stony rocks called *Myrmeces*. Also the towne *Leuce* vpon the cape so called: sometime an Island it was: and last of all *Phocæa*, which limiteth and boundeth *Ionia*. But to returne to *Smyrna*; the most part of *Æolia*, whereof we will speake anon, repaires commonly thither to their Parliament and Assises. Likewise the *Macedonians*, surnamed *Hircani*, as also the *Magnetes* from *Sipylum*. But vnto *Ephesus*, which is another principal and famous city of *Asia*, resort those that dwell farther off, to wit, the *Cæsarians*, *Metropolites*, *Cylbianes*, the *Myſo-Macedonians*, as well the higher as the lower, the *Maſtaurians*, *Bullites*, *Hyppepeonians*, and *Dios-Hieritæ*.

CHAP. XXX.

Æolis, Troas, and Pergamus.

A *Æolis*, in old time *Myſia*, confronts vpon *Ionia*: so doth *Troas*, which bounds on the coast of *Helleſpontus*. Being then past *Phocæa*, you meet with the port *Ascanius*, & the place where sometime *Lariſſa* stood: and now *Cyme*, and *Myrina* which loueth to be called *Sebastopolis*. Within the firme land, *Ægæa*, *Attalia*, *Posidea*, *Neon-tichos*, and *Temnos*. But vpon the coast, the riuér *Titanus*, and a city taking name thereof. The time was when a man might haue seen there the city *Grynia*: but now there is but an haue and the bare ground, by reason that the Island is taken into it, and ioined thereto. The towne *Elæa* is not farre from thence, and the riuér *Caicus* comming out of *Myſia*. Moreouer, the towne *Pytane*, and the *Riuér Canaius*. Other townes there were in old time, but they are lost and perished, namely, *Canæ*, *Lyſimachia*, *Atarnæa*, *Carenæ*, *Cisthene*, *Cilla*, *Cocillum*, *Thebæ*, *Aſtyre*, *Chryſa*, *Palæſteſis*, *Gergithos*, and *Neandros*. Yet at this day are to be seen the city *Perperene*, & beyond it the tract and territory *Heracleotes*, the towne *Coryphas*, the riuér *Gryliſolius*, the quarter called *Aphrodisias*, before-time *Polirice*. *Orgas* the country, and *Scepsis* the new. The riuér *Evenus*, vpon the banke whereof stood once *Lymneſſos*, and *Mileros*, but now they are gon. In this tract is the mountain *Ida*. Moreouer, in the sea coast, *Adramytteos*, sometime called *Pedafus*, where the Parliament and Terme is holden, and whereof the gulfe is named *Adramytteos*. Other riuers be there besides, to wit, *Aſtron*, *Cormalos*, *Eryannos*, *Alabaſtros*, and *Hieros* out of *Ida*. Within-forth be *Gargara*, a towne and hill both. And then again toward the sea side, *Antandros*, before-time called *Edonis*: then, *Cymeris*, and *Aſſos*, which also is *Apollonia*. Long since also there was a towne called *Palamedium*. After all these, you come vpon the cape *Leolon*, the middle frontier between *Æolis* and *Troas*. And there had bin in ancient time the city *Polymedia*, and *Cryſſa*, with another *Lariſſa* also. As for the Temple *Smintheum* it remaineth still. But farther within, the towne *Colone* that was, is now decayed and gon, and the traffique and negotiation in all affaires turned from thence to *Adramytteum*. Now as touching the territorie of the *Apollonians*, after you be past the riuér *Rhyndicus*, you finde these States; the *Ereſians*, *Miletopolites*, *Pœmanenes*, *Macedonians*, *Aſchilacæ*, *Polychneæ*, *Pionites*, *Cilices*, and *Mandagandenes*. In *Myſia*, the *Abrettines*, and those called *Helleſpontij*; besides those of base account and estimation. The first city you encounter in *Troas*, is *Amaxintus*: then *Cebrenia* and *Troas* it selfe, named also *Antigonia*, now *Alexandria*, and is entituled a Roman Colony. Beyond *Troas* standeth the towne *Nec*: there runneth also *Scamander*, a riuér nauigable; and *Sigæum*, a Towne sometime, vpon the cape so called. At length you come to the haue of the *Greeks*, into which *Xanthus* and *Somœis* runne ioyntly together, as also

also Palæ-Scamander, but first it maketh a lake. The rest that *Homer* so much speaks of, namely *Rhæsius*, *Heptaporus*, *Carefus*, and *Rhodus*, there is no mention or token remaining of them: as for the river *Granicus*, it runneth from diuers parts into the chanel of *Propontis*. Yet there is at this day a little city called *Scamandria*: and one mile and a halfe from the port or sea, the free city *Ilium*, that enjoyeth many immunities and liberties; of which towne goeth all that great name. Without this gulfe lieth the coast *Rhœtea*, inhabited with these townes vpon it, namely, *Rhœteum*, *Dardanium*, and *Arisbe*. There stood sometimes also *Acheleum*, a towne nere vnto the tombe of *Achilles*; founded first by the *Mityleneans*, and afterwards re-edified by the *Athenians*, vpon the Bay *Sigæum*, vnder which his fleet rode at anchor. There also was *Acantium*, built by the *Rhodians*, in another coine or canton of that coast, where *Ajax* was interred, a place thirty stadia distant from *Sigæum*, and the very Bay wherein his fleet also lay at harbour. About *Æolis* and one part of *Troas*, within the Continent and firme land there is the towne called *Teuthrania*, which the *Mysians* in old time held. And there springeth *Caicus* the river aboue said. A large countrey this is of it selfe, and especially when it was vnto *Mysia*, and all so called: containing in it *Pionia*, *Andera*, *Cale*, *Stabulum*, *Conisium*, *Tegium*, *Balcea*, *Tiare*, *Teuthrae*, *Sarnaca*, *Haliferne*, *Lycide*, *Parthenium*, *Thymbrum*, *Oxiopum*, *Lygdanum*, *Apollonia*, and *Pergamus* the goodliest city of them all by many degrees: through it passeth the river *Selinus*, and *Cælius* runneth hard vnder it, issuing out of the mountain *Pindarus*. And not far from thence is *Elea*, which as we said standeth vpon the strond. And verily all that tract and iurisdiction is of that city named *Perganena*. To the Parliament and iudiciall Assises there resort the *Thyatyrenes*, *Mygdones*, *Mosines*, *Bregmenteni*, *Hieracomitæ*, *Perpereni*, *Tyareni*, *Hierapolenses*, *Harmatapolites*, *Atrallenses*, *Pantaenses*, *Apollonidenses*, and other petty cities of no name and account. As for *Dardanium*, a pretty towne it is, threecore and ten stadia from *Rhœteum*. Eightene miles from thence is the cape *Trapeza*, where the sea beginneth to rush roughly into the streight *Hellespont*. *Eratosthenes* mine Authour saith, That the cities of the *Solyimi*, *Leleges*, *Bebrices*, *Colycantij* and *Trepseiores* sometime flourished, but now are vtterly perished. *Isidorus* reporteth as much of the *Arymeos* and *Capretæ*, the very place where *Apamia* was built by *Seleucus*, betweene *Cilicia*, *Cappadocia*, *Catoonia*, and *Armenia*: and for that he had vanquished most fierce and cruell nations, at the first he named it *Damea*.

CHAP. XXXI.

¶ The Islands lying before little Asia, and in the Pamphylian sea. Also *Rhodus*, *Samus*, and *Chios*.

THE first Island of Asia is iust against the mouth or channell of *Nilus*, called *Canopicus* of *Canopus*, (as men say) the Pilot of *K. Menelaus*. The second is *Pharus*, which is ioined to *Alexandria* by a bridge: in old time it was a daies sailing from *Ægypt* to it: and now by fires from a watch-tower sailers are directed in the night along the coast of *Egypt*. *Cæsar Dictator* erected therein a colory. And in truth it serueth in right good stead as a *Lanthe*: for the hauens about *Alexandria* be very dangerous and deceitfull, by reason of the barres and shelues in the sea: and there are but three chanelles and no more, by which a man may passe safely to *Alexandria*, to wit, *Tegamum*, *Posideum*, and *Taurus*. Next to that Isle, in the *Phœnician* sea before *Ioppa*, lies *Paria*, an Isle of no great compass, for it is all one town. This is the place, folke say, where lady *Andromeda* was exposed and cast out to a monster. Moreouer, *Aredos*, the Isle before named, between which and the Continent there is a fountaine, as *Mutianus* writeth, in the sea where it is fifty cubits deep, out of which fresh water is drawne and conueighed from the very bottome of the sea, through pipes made of leather. As for the *Pamphylian* sea, it hath some smal Islands of little or no reckoning. In the *Cilician* sea there is *Cyprus*, one of the five greatest in those parts, and it lieth East and West full against *Cilicia* and *Syria*. The Seate it was in times past, whereunto nine Kingdomes did homage, and of which they held. *Timosthenes* saith, That it contained in circuit foure hundred and nineteene miles and an halfe: but *Isidorus* is of opinion, that it is but three hundred seuentie five miles about. The full length thereof

A thereof betweene the two capes, *Dinaretas* and *Acamas*, which is Southward, *Artemidorus* reporteth to be a hundred and sixtie miles and a halfe: and *Timosthenes* two hundred; who saith besides, that sometime it was called *Acamantis*: according to *Philonides*, *Cerastris*: after *Xenagoras*, *Aspelia*, *Amathusia*, and *Macatia*: *Astynomus* calleth it *Cryptos* and *Colinia*. Townes there be in it fiftene, *Paphos*, and *Palepaphos* (that is, *Paphos* the new, and *Paphos* the old,) *Curias*, *Citium*, *Corineum*, *Salamis*, *Amathus*, *Lepathos*, *Solœ*, *Tamaseus*, *Epidarum*, *Chytiri*, *Arfinoc*, *Carpasium*, and *Golgi*. There were in it besides, *Cinirya*, *Marium*, and *Idalium*: but now are they come to nothing. And from the cape *Anemurium* in *Cilicia*, it is fifty miles distant. All that sea which lieth betweene it and *Cilicia*, they call *Aulon Cilicium*, that is to say, The plaine of *Cilicia*. In this tract is the Island *Elæusa*: and foure others besides, euen before the cape, named *Clides*, ouer-against *Syria*. Likewise one more, named *Stiria*, at the other cape or point of *Cilicia*. Moreouer, against *Neampaphos*, [i. new *Paphos*] the Isle *Hierocopia*. Against *Salamis*, *Salaminx*. Moreouer in the *Lycian* sea there be *Illyris*, *Telendos*, *Artelebussa*, and three *Cypriæ*, all barren and fruitlesse: besides *Dionysia*, before-time called *Carætha*. Moreouer, against the promontory of *Taurus*, and the *Chelidonia*, hurtfull and dangerous to saylers: and besides them as many more, together with the towne *Leucola*, called *Paðia*, namely, *Lafia*, *Nymphous*, *Macris*, *Megista*, in which the citie that flood is gone. Besides these, many others therewere, but of no importance. But ouer-against the cape *Chimera*, *Dolichiste*, *Chirogilium*, *Crambussa*, *Rhoge*, *Enagora* of eight miles. Against *Dædalion*, two: against *Cryeon*, three: *Stongyle*, moreouer, against *Sidynia*, which king *Antiochus* founded: and toward the river *Glaucus*, *Lagusa*, *Macris*, *Didyma*, *Helbo*, *Scope*, *Aspis*, and *Telandria*: howbeit, the towne in it is sunke and gone: last of all the Isle *Rhodusa*, next to the harborough or haue *Caunus*. But the fairest of all is the Isle *Rhodes*, a free state, and subiect to none: It containeth in compass an hundred and thirtie miles, or if we rather giue credit to *Isidorus*, an hundred and three. Three great townes there be in it well peopled, *Lindus*, *Camirus*, and *Ialyfus*, now called *Rhodes*. By the account of *Isidorus* it is from *Alexandria* in *Ægypt*, five hundred seuentie and eight miles: but according to *Eratosthenes* five hundred sixty and nine: after *Mutianus* five hundred, and from *Cyprus* foure hundred and sixteene. Many names hath it been knowne by in times past, to wit, *Ophysa*, *Asteria*, *Æthraea*, *Trinacria*, *Corymbia*, *Pœessa*, *Atabyria* of king *Arabyris*: and finally, *Macaria*, and *Oloessa*. Many other Islands be subiect vnto it, and namely *Carpathus* (which gaue name to the sea *Carpathium*) *Casos*, *Achme* in times past: and *Niseros*, distant from *Gnidus* twelue miles and an halfe, which heretofore had bene called *Porphyris*. And in the same ranche, *Syme*, betweene *Rhodes* and *Gnidus*, and is in circuit six and thirtie miles and a halfe. Enriched this Island is with eight commodious hauens. Ouer and besides these, there lie about *Rhodes*, *Cyclopis*, *Teganon*, *Cordylusa*, foure vnder the name of *Diabete*: *Hymos*, *Chalcis*, wherein standeth a good towne: *Seutusa*, *Narthecusa*, *Dimaltos*, and *Progne*. Being past *Gnidus*, yee shall discouer *Ciferussa*, *Therionarce*, *Calydne* beautified with three townes, to wit, *Nortium*, *Nisyrus*, *Mendeterus*: with *Arconesus* the Isle, wherein standeth the towne *Ceramus*. Vpon the coast of *Caria*, the Islands, twenty in number, called *Argia*: besides, *Hytussa*, *Lepsia*, and *Leros*. But the goodliest & most principall of all others in that coast is *Cos*, which lieth from *Halicarnassus* fiftene miles; and in compass about, it beareth an hundred miles: as men thinke, *Merope* it was called: as *Staphylus* saith, *Cos*: but according to *Dionysius*, *Meropis*: and afterwards *Nymphæa*. This Isle is fortified with the mount *Prion*: and as some thinke, *Nisyrus* the Island, named before-time *Porphyris*, was of old vnto this; and afterwards dismembred from it. Beyond this Island yee may discouer *Carianda*, with a towne in it: and not farre from *Halicarnassus*, *Pidosus*. Moreouer, in the gulfe *Ceramicus*, *Priaponeus*, *Hipponeus*, *Psyræ*, *Mya*, *Lampfemandus*, *Passala*, *Crusa*, *Pyrre*, *Sepiussa*, *Melano*. And within a litle of the maine, another called *Cinedopolis*, by occasion of certain *Catamites* and shamefull baggages that king *Alexander* the Great left there. The coast of *Ionis* hath in the sea the Islands *Ægæa* and *Corseæ*, besides *Icaros*, spoken of before. Also *Lade*, before-time called *Lata*: and among some other little ones of no worth, the two *Camelides* nere to *Milerus*. Moreouer, *Mycalum*, *Trogylia*, *Trepilion*, *Argennon*, *Sardalion*: & the free Island *Samos*, which in circuit hath fourescore and seuen miles, or as *Isidorus* thinkes, a hundred. *Aristotle* writeth, how at the first it was called *Parrhania*, afterwards *Dryusa*, and then *Anthemusa*.

Aristocritus giueth it moreouer other names, to wit, Melamphyllus, yea, and Cyparissia: others terme it Partheno-arusa, and Stephane. Riuer in it be Imbrasus, Chesium, and Ibetres: fountaines of fresh water, Gigarto, and Leucothea: but no other hills, laue only Cercetius. There lie adioyning to it other Islands besides, namely, Rhypara, Nymphæa, and Achillea. Fourescore and thirteene miles from it, you may discouer Chios, a free state, with a town in it, which is an Island as renowned euery way as Samos: *Ephorus* by the ancient name calleth it Æthalia: *Metrodorus* and *Cheubulus*, Chia, of a certaine lady Nymph, whose name was *Chio*: others supposed it was so called of Chion, i. Snow: and some would haue it to be Macris and Pityusa. An hill there is in it called Pellenæas, where the good marble is digged, called Chium. The ancient Geographers haue written, That it is a hundred twenty and fise miles about; and *Isidorus* addeth nine more. Scituate it is betweene Samos and Lesbos, full opposite vnto the cape Erythra. Neere vnto it lie Thallusa (which some write Dapnusa,) Oenussa, Elaphites, Euryanassa, Arginussa with a towne. Now are all these about Ephesus, as also the Isles of *Pisistratus*, so called: and those which are named Anthina, to wit, Myonessus, and Diareusa. In both these the townes that were, be lost through water. Furthermore, the Island Poroselenæ with a towne in it, Cercia, Halone, Commone, Illetia, Lepria, and Rhospheria, Procusa, Bolbulæ, Phana, Priapos, Syce, Melane, Ænare, Sidusa, Pela, Drymusa, Anydros, Scopelos, Sycussa, Marathussa, Psile, Perirheusa, and many others of no reckoning. But among the Isles of name, is that of Teos, lying farther in the deepe sea, which hath a towne in it: and lieth from Chios fourescore and one miles, and as much from the Bay Erythra. Neere vnto Smyrna are the Islands Peristerides, Catieria, Alopecce, Elæussa, Bachina, Pyrtira, Crommyonessus, and Megale. And iust before Troas, the Isles Ascania, and three Plateæ. Then the Lamiæ, and two Plitaniæ. Moreouer, the Islands Plate, Scopelos, Getone, Artheidon, Celæ, Lagussa, and Didymæ. But the most stately of all others in this sea, is Lesbos, which lies from Chios threescore and fise miles. Named it was in times past, Hemerte, Lafia, Pelalgia, Ægira, Æthiope and Macaria: within it were eight townes of name; whereof one, namely Pyrrha, is swallowed vp of the sea: and another, to wit, Arisbe, ouerthrowen by an earthquake. As for the Isle Methymna was peopled from Antissa, which was vnited to it, and wherein were eight townes, and is about seuen and thirtie miles from * Asia the lesse. As for the townes Agamede and Hiera which were in it, gone they be now and vtterly perished. Yet there remaine Eresos, Pyrrha, and Mitylenæ, which hath continued for fise hundred yeeres, mighty and puissant. *Isidorus* saith, That this Island is in circuit about a hundred seueny and three miles: but the old Geographers, a hundred ninety and fise. In it are these mountaines, Lepethymus, Ordymnus, Maristus, Creon, and Olympus. Eight miles and a halfe it is from the Continent, where it lieth neereft. About this Island Lesbos, there lie neere at hand other little ones, namely, Saudalion, and the fise Leuca. Of which Cydonea is one, wherein is a fountaine of hot water. As for Argenussa, from thence to Ægæ is reckoned foure miles. There are besides in this coast Phellusa, & Pedua. Now without Hellepont, ouer-against the bay and cape Sigæum, lieth the Isle Tenedus, called sometimes Leucophrys, Phænice, and Lynceffos. From Lesbos it is six and fifty miles, and from Sigæum twelue miles and a halfe.

CHAP. XXXII.

¶ *Hellepontus, Mysia, Phrygia, Gallatia, Bithynia, Bosphorus.*

Archipelago.

Let vs now leaue the Isles in the sea Ægeum, and come to Hellepont, now called the streights of Callipolis: whereinto the maine sea gushes with a mighty force and violence, with his gulfes and whirlpooles, digging before him a way, vntil he haue limited and diuided Asia from Europe. The promontory first appearing there, we named Trapeza. From which tenne miles off, standeth the towne Abidum, where the streights are but seuen stadia ouer. Beyond it is Percote the towne: and Lampfacum, called before-time Pityusa. Moreouer, the Colonie Parium, which *Homer* named Adrastia. Moreouer, the towne Priapos, the riuer Æscopus and the cape Zelia. Then come ye to Propontus, for so is the place called where the sea begins to enlarge it selfe. Into this channell runneth the riuer Granicum, which maketh the hauen Artace, where once stood a towne. Beyond it there is an Island, which *Alexander* the Great ioined to the Continent [by two bridges, according to *Strabo*] in which standeth the towne Cyzicum,

A zicum, founded by the Milesians, called heretofore Arconnefos, Dolionis, & Dindymis, neere the top whereof is the mountaine Dindymus. When ye are beyond Cizycum, you meet with these townes besides, Placia, Ariacos, Scylacum, & behind them, the hill Olympus, called sometime Mæsius. Also the city Olympena. The riuers Horiæus and Rhyndacus, named heretofore Lycus. This riuer taketh his beginning in the marish or meere Artynia, neere to Miletopolis. It receiueth into it Marestos, and many others, and parteth Asia from Bithynia. This region in ancient time was called Cronia: after, Theffalis: then Malianda, and Strymonis. All this nation of these quarters, *Homer* named Halizones, for that they be enuiroined with the sea. Therein stood in old time a mighty great city named Attusa. At this day it hath 15 cities, amongst which is Gordiu, come, now called Iuliopolis: and in the very coast vpon the sea, Dascylos. Go further on and ye meet with the riuer Gebes: and within the main, the towne Helgas, the same that Germanicopolis, knowne also by another name, Booscoere, as also Apamea, now called Myrtea of the Colophonians. Being past it, you come to the riuer Etheleum, the ancient limit of Troas, where Mysia beginneth. Afterwards you enter into the gulfes of Bryllion, whereinto runneth the riuer Ascanium, vpon which standeth the towne Bryllion, and beyond it you shall see the riuers Helas and Cios, together with a towne of that name. A mart towne this was, whereto resorted the Phrygians that border neere to it, for to traffique and furnish themselves with merchandise: built verily it was by the Milesians: but the place whereon it stood was called Ascania of Phrygia. And therefore me-thinks we cannot do better than euen here to speake of that country. Phrygia then spreadeth out about Troas and the nations before-named, from the cape Lectus vnto the riuer Etheleus. It confronteth on the North side vpon part of Galatia, Southward it boundeth hard to Lycæonia, Pisidia, and Mygdonia. And on the East part it reacheth to Cappadocia. The townes of greatest name, besides those before rehearsed, be Ancyra, Andria, Celæna, Colosse, Carina, Cotiaion, Ceranæ, Iconium, and Midaion. Certain Authors I haue, who write, that out of Europe there come to inhabit these parts, the Mysi, Bryges, and Thyni, of whom are descended and likewise named, the Mysians, Phrygians, and Bithynians.

And euen here I think it good to write also of Galatia, which lying higher than Phrygia, yet possesseth a greater part of the plaine country thereof, yea and the capitall place of it, sometime called Gordium. They that inhabited and held that quarter of Phrygia were Gaules, called Tolistobogi, Voturi, and Ambitui: but they that occupied the countreys of Mæonia and Paphlagonia were named Trochmi. This region confronteth Cappadocia on the North and East side, and the most fruitfull part thereof the Tectofages and Teutobodiaei kept in their possession. And so much for the principall nations of this country. As for the States, Terrarchies, and regiments, there be in all 195. The townes are these: of the Tectofages, Ancvra: of the Trochmi, Tavium: of the Tolistobogians, Pefinus. Besides these, there be States of good account, Attalenses, Arasenses, Comenses, Dios hieronitæ, Lystreni, Neapolitani, Oeandenses, Seleucenses, Sebasteni, Timmoniacenses, and Tebaseni. This Galatia extendeth euen as far as to Gabalia and Milyæ in Pamphylia, which are scituate about Baris: also Cyllaticum and Oroadicum, the marches of Pisidia, likewise Obigene, part of Lycæonia. Riuers there be in it, beside those before named, Sangarium and Gallus, of which riuer, the gelded priests of dame *Cybele*, mother of the gods, were named Galli. Now it resteth to speake of the towns vpon the sea coast. Yet I cannot ouerpasse Prusa neere to Cios, which lieth farre within the country of Bithynia, which *Annibal* founded at the foot of the hill Olympus: from Prusa to Nicæa are counted 25 miles: in which way lieth the lake Ascanium betweene. Then come you to Nicæa in the very vtmost part of the gulf Ascanium, which before was called Olbia: also to another Prusa, built vnder the mountaine Hippius. Once there were in this coast Pythopolis, Parthenopolis, and Coryphanta. And now there be vpon the sea side these riuers, Æsius, Bryazon, Plataneus, Arcus, Siros, Gendos, named also Chrysothoas. The promontory also, vpon which stood the towne Megaricum. Then the gulfes or arme of the sea which was called Craspedites, for that that towne before named stood as it were in a fold, plait, or nouke thereof. Sometimes also there was the towne Astacum, whereupon the Creeke tooke the name of Astacenus. Moreouer, in ancient time, the Towne Libyssa, by report, was planted there: But now there remaineth nothing else to be seen but the tombe of *Annibal*. But in the inmost part of the Gulfe, where it endeth, there standeth the goodly faire City of Bithynia called Nicomedia.

media. The cape Leucatas, which incloseth the gulfe Astareus, is from Nicomedia 42 miles and halfe. Being past this gulfe, the sea begins to streighten again, and the land to meet neer together; and these streights reach as far as Bosphorus in Thracia. Vpon these streights stands the free city Chalcedon, 72 miles and a halfe from Nicomedia. Before time it was called Procrastis: then Compusa: afterwards, the city of the Blind, for that they who founded it, being in a place but 7 stadia from Bizantium, where was a seat in all respects more commodious and fit for a city, were so blind as not to chuse it for the plot of Chalcedon. But within the firme land of Bithynia is the colony Apamena: and there inhabit also the Agrippenses, Iuliopolites, and they of Bithynium. Moreouer, for riuers ye haue Syrium, Lapias, Pharmicas, Alces, Crynis, Lylæus, Scopius, Hieras, which parteth Bithynia from Galatia. Beyond Chalcedon stood Chrysopolis: then Nicopolis, of which the gulfe still retaines the name, wherein is the haven of Amycus: the cape Naulocum, Estia, wherein is the temple of Neptune: and the Bosphorus, a streight halfe a mile ouer, which now once again parteth Asia and Europe. From Chalcedon it is 12 miles and an halfe. There beginneth the sea to open wider, where it is 8 miles & a quarter ouer, in that place where stood once the towne Philopolis. All the maritime coasts are inhabited by the Thyni, but the inland parts by the Bithynians. Lo here an end of Asia, and of 282 nations, which are reckoned from the limits and gulf of Lycia, vnto the streights of Constantinople. The space of the streights of Hellespont and Propontis together, vntill you come to Bosphorus in Thracia containeth in length 188 miles, as we haue before said. From Chalcedon to Sigeum, by the computation of *Isidor*, are 372 miles and a halfe. Islands lying in Propontis before Cyzicum, are these, Elaphonnesus, from whence commeth the Cyzicen marble; and the same Isle was called Neuris, and Proconnesus. Then follow Ophyusa, Acanthus, Phœbe, Scopelos, Porphyrione, and Halone with a towne. Moreouer, Delphacia and Polydora, also Artacæon, with the towne. Furthermore, ouer against Nicomedia is Demonnesos: likewise beyond Heraclea, iust against Bithynia, is Thynias, which the Barbarians call Bithynia. Ouer and besides, Antiochia: and against the fosse or riuer Rhyndacus, Besbicos, 18 miles about. Last of all, Elæa, two Rhodustæ, Erebinthus, Magale, Chalcitis, and Pityodes.

THE SIXTH BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

CHAP. I.

¶ Pontus Euxinus.

He sea called Pontus Euxinus, and named by the Greeks in old time, Axenos, for the hard vsage that passengers found at the hands of those sauage Nations vpon the coasts thereof, is spred also betwixt Europ and Asia, vpon a very spite and speciall enuy of Nature, as it seems, to the earth, and a wilfull desire to maintaine the sea still in his greatnesse, and to fulfill his greedy and endlesse appetite. For theee was not contented to haue inuironed the whole earth, with the main Ocean, yea and taken from it a great part thereof, with exceeding rage overflowing the same, and laying all empty and naked: it sufficed not, I say, to haue broken through the mountaines, and so to rush in, and after the sea had dismembred * Caspe from Affricke, to haue

A haue swallowed vp much more by far than is left behind to be seen: no nor to haue let Propontis gush through Hellespont, and so to encroach again vpon the earth and gaine more ground: vnlesse from the streights of Bosphorus also he enlarge himselfe into another huge and vast sea, and yet is neuer content, vntill the lake Mœotis also with his streight, meet with him as he thus spreadeth abroad and floweth at liberty, and so ioine together and part as it were, their stolne good betweene them. And verily that all this is happened maugre the earth, and that it made all resistance that it could, appeareth evidently by so many streights and narrow passages lying between these two elements of so contrary nature (considering that in Hellespont, the space is not about 875 paces from land to land; and at the two Bosphori the sea is so passeable, that oxen or kine may swim at ease from the one side to the other: and hereupon they both tooke their name:) the which vicinitie serueth very wel to entertaine and nourish amity among nations, separated by nature one from another, and in this disunion as it were, appeareth yet a brothely fellowship and vnitie. For the cocks may be heard to crow, and the dogs to bark, from the one side to the other, yea and men out of these two worlds may parly one to another with audible voice, and haue commerce of speech together, if the weather be calme, and that the windes doe not carry away the sound thereof.

Well, the measure some haue taken of the sea, from Bosphorus Thracius to the lake of Mœotis, and haue accounted it to be 1438 miles and a halfe. But *Eratoſthenes* reckoneth it lesse by one hundred. *Agrippa* saith, that from Chalcedon to Phacis, is a thousand miles, and so to Bosphorus Cimmerius 360 miles. As for vs we will set downe summarily and in generall, the distances of places, according to the moderne knowledge of our nation in these daies, forasmuch as our armies haue warred in the very streight and mouth of this Cimmerian streight.

Being passed then from the streight of Bosphorus Thracius, we meet with the riuer Rhebas, which some haue called Rhœsus; and beyond it Pissilis another riuer, then come we to the port of Calpas, and Sangarius one of the principall riuers of Asia; it ariseth in Phrygia, it receiueh other huge riuers into it, and among the rest Tembrogius and Gallus. The same Sangarius was called also Coralius. After this riuer, begin the gulfes Mariandini, vpon which is to be seen the towne Heraclea, scituate vpon the riuer Lycus. It is from the mouth of Pontus 200 miles. Beyond it is the port Acone, cursed for the venomous herbe and poisonous Aconitum, which taketh name thereof. Also the hole or caue Acherusia. Riuers also there be, Pedopiles, Callichorum and Sonantes. One towne, Tium, eight and thirty miles from Heraclea: and last of all, the riuer Bilis.

CHAP. II.

¶ The nation of the Paphlagonians and Cappadocians.

Beyond this riuer Bilis, is the countrey Paphlagonia, which some haue named Pylemerina; and it is inclosed with Galatia behinde it. The first towne ye meet in it, is Mastya, built by the Milesians: and next to it, is Cromna. In this quarter the Heneti inhabit, as *Cornelius Nepos* saith. Moreouer, from thence the Venetians in Italy, who beare their name, are descended as he would haue vs beleue. Neere to the said towne Cromna, is another called Sefamum in times past, and now Amastris. Also the mountaine Cytorus, 64 miles from Tium. When you are gone past this mountain, you shall come to Cimolus and Stephane, two townes, and likewise to the riuer Parthenius; and so forward to the cape and promontory Corambis, which reacheth forth a mighty way into the sea: and it is from the mouth of the sea Pontus 315 miles, or as others rather thinke, 350. As far also it is from the streight Cimmerius, or as some would rather haue it, 312 miles and a halfe. A towne there was also in times past of that name; and another likewise beyond it called Arminum: but now, there is to be seen the colony Sinope, 164 miles from Citorum. Being past it, you fall vpon the riuer Varetum, the people of Cappadocia, the townes Gazima and Gazelum, and the riuer Halyto, which issuing out of the foot of the hill Taurus, passeth through Cataonia and Cappadocia. Then meet you with these townes following, Gangre, Carissa, and the free city Amisum, which is from Sinope 130 miles. As you trauell farther, you shall see a gulfe carrying the name of the said towne, where the sea runneth so far within the land, that it seems to make Asia well-neare an Island: for from thence vnto the gulf Issicus in Cilicia is not about 200 miles through the continent. In al which tract, there be

no more than three nations which iustly and by good right, may be called Greekes, to wit, the Dorians, Ionians, and Æolians; for all the rest are reputed barbarous. Vnto Amisum, there ioined the towne Eupatoria, founded by *K. Mithridates*; and after that he was vanquished, both together tooke the name of Pompeiopolis.

CHAP. III.

¶ *Cappadocia.*

IN Cappadocia, there is a city well within the land, called Archelais, situate vpon the riuer Halys: which *Claudius Cesar* the Emperor erected as a colony, and peopled it with Romane souldiers. There is besides a towne which the riuer Sarus runneth vnder: also Neo-cæsarea, which Lycus passeth by: and Amasia with the riuer Iris running vnder it, within the countrey Gazacena. Moreouer, in the quarter called Colopena, there stand Sebastia & Sebastopolis, little towns indeed, howbeit comparable with those abovesaid. In the other part of Cappadocia there is the city Melita, built by queene *Scmiramis*, not far from Euphrates: also, Dio-cæsarea, Tyana, Castabala, Magnopolis, Zela, and vnder the mountaine Argæus, Mazaca, which now is named Cæsarea. That part of Cappadocia which lieth before Armenia the greater, is called Melitene: that which bordereth vpon Comagene, Cataonia: vpon Phrygia, Garfaurit: vpon Sargaurasana, Cammanum; and finally vpon Galatia, Morimene. And there the riuer Cappadox separateth the one from the other. Of this riuer the Cappadocians took name, whereas beforetime they were called Leucosyras for the lesse Armenia, the riuer Lycus diuideth it from Neo-cæsarea before said. Within the country there runneth also the great riuer Ceraunus. But on the coast side, when you are past the city Amysum, you meet with the town Lycastum, and the riuer Chadisa; and once past them, you enter into the countrey Themiscyrea. In this quarter also you may see the riuer Iris, bringing down with it another riuer Lycus that runneth into it. And in the midland parts there is the city Zicia, ennobled for the ouerthrow of *Triarius*, whom *C. Cesar* defeated with his whole army. But in the coast againe you shall encounter the riuer Thermodon, which issueth from before a castle named Phanarœa, and passeth beside the foot of the mountaine Amazonius. In which place there stood sometime a towne of that name, and other fiue, namely, Phamizonium, Themiscyrea, Sotira, Amasia, Comana, at this present called Mantium.

CHAP. IV.

¶ *The people of the region Themiscyrene.*

MOREouer, in Pontus ye haue the nations of the Genetæ & the Chalybes, together with a town of Coryi. People besides called Tibareni, and Mossyni, who brand and marke their body with hot searing yrons. Also the nation of the Macrocephali, with the towne Cerasus, and the port Cordula. Beyond which you come to a people named Bechires, and Buzeri, and to the riuer Melas. And so forward to the quarter of the Macrones, Sideni, & so to the riuer Sydenum, vpon which is situate the town Polemonium, distant from Amisum 220 miles: where ye shall finde the riuers Iasonius and Melanthius; and a towne 80 miles from Amisum, called Pharnacea; the castle and riuer of Tripolis. Item, Philocalia, and Liniopolis without a riuer: and lastly the imperiall & free city Trapezus, enuironed with a high mountain, 100 miles from Pharnacea. And being past Trapezus, you enter into the country of the Armenochalybes, and Armenia the greater; which are 30 miles asunder. But vpon the coast you shall see the riuer Pyxites that runneth euen before Trapezus; and beyond it the country of the Sanni Heniochi. Moreouer, the riuer Abfarus, in the mouth whereof there is a castle likewise so named, from Trapezus 150 miles. Behind the mountains of that quarter, you meet with the region Iberia; but in the coast thereof the Heniochi, Ampreutæ and Lazi. The riuers Campeonyfis, Nogrus, Bathys. When ye are once past them, you come into the countrey of the Colchians, where stands the town Marium, with the riuer Heracleum passing vnder it, & a Promontorie of that name, & last of all, the most renowned riuer of all Pontus, called Phasis: this riuer riseth from out of the Moschian mountains, & for 38 miles and an halfe, is nauigable, & beareth any great vessels whatfouer. And then for a great way it carrieth smaller bottoms, & hath ouer it

A 120 bridges. Beautified it was sometimes with many faire townes vpon the bankes thereof on both sides, and the principall of them all, were Tyritæum, Cygnus, and the city Phasis situate in the very mouth thereof, as it falleth into the sea. But the goodliest city planted vpon this riuer, and most famous of all the rest was Æa, fifteene miles distant from the sea: where Hippos and Cyanos, two mighty great riuers, comming from diuers parts, enter both into the riuer Phasis. But now there is no count made of any but of Surium onely, which taketh name of the riuer Surium which runneth to it. And thus far we said that Phasis was capable of great ships. Among other riuers which it receiues, for number and greatnesse admirable, is the riuer Glaucaus. In the fosse and mouth of this tiuer Phasis, where hee is discharged into the sea, there be some little Islands of no reckoning. And there, from Bfarus it is 75 miles. Being past Phasis you meet with another riuer called Charien: vpon which bordereth the nation of the Salæ, named in old time Phthiophagi and Suani, where you shall meet with the riuer Cobus, which issueth out of Caucasus, and runneth through the country of the Suani aboue said. Then you come to another riuer Rhoas, and so forward to the region Eerectice: to the riuers Sigania, Tersos, Atelpos, Chryforrhoas, and the people Abfilæ: the castle Sebastopolis, an hundred miles from Phasis, the nation of the Sanigores, the towne Cygnus, the riuer and towne both called Pityus. And last of all ye arriue vpon the country of the Heniocha, where be nations entituled with many and fundry names.

CHAP. V.

¶ *The region of Colchis, the Achæi, and other nations in that tract.*

NEXT followeth the region of Colchis, which is likewise in Pontus: wherein the mountain Caucasus windes and turnes toward the Rhiphæan hills, as hath been said before, and that mountaine of the one side bendeth downe toward Euxinus, Pontus, and Mæotis; and of the other, enclineth to the Caspian and Hircane seas. When ye are descended to the maritime coasts, ye shall find many barbarous and sauage nations there inhabiting, to wit, the Melanchlæni, and the Choruxi, where sometimes stood Dioscurias a city of the Cholchians, neere vnto the riuer Anthemus, which now lieth wast and dispeopled, notwithstanding it was so renowned in times past, that by the report of *Timosthenes*, there repaired thither and inhabited therein 300 nations of diuers languages. And euen afterwards our Romanes were forced to prouide themselves of 130 interpreters, when they would negotiate and traffick with the people in and about Dioscurias. Some there be that think how it was first founded by *Amphitus* and *Telchium*, who had the charge of the chariots of *Cæstor* and *Pollux*: for certain it is, that the fierce and wild nation of the Heniochi, are from them descended. Being past Dioscurias, you come vpon the towne Heraclium, which from Sebastopolis is 80 miles distant: and so forward to the Achæi, Mardi and Cercetæ: and after them to the Serri, and Cephaloromi. For within that tract stood the most rich and wealthy town Pitius, which by the Heniochians was rancked and spoiled. On the backe part thereof inhabit the Epagerites [a nation of the Sarmatians] euen vpon the mountaine Caucasus: and on the other side of that hill, the Sauromatæ (the country is at this day called Tartaria the great.) Hither retired and fled king *Mithridates* in the time of *Claudius Cesar* the Emperor: who made report, that the Thali dwell thereby, and confine Eastward vpon the very opening of the Caspian sea: which by his report remaineth dry, whenfouer the sea doth ebbe. But now to turne vnto the coast neer vnto the Cercetæ, you meet with the riuer Icarusa, with a towne and riuer called Hierum, 136 miles from Heracleum. Then come yee to the cape Cronea, in the very ridge and high pitch whereof the Toretæ inhabit. But beneath it you may see the citie Sindica, 67 miles situate from Hierum: and last of all, you arriue vpon the riuer Sceaceriges.

CHAP. VI.

¶ *Mæotis, and the streights thereof called Bosphorus Cimmerius.*

FROM the said riuer to the very entrance of the Cimmerian Bosphorus are counted 88 miles and a halfe. But the length of the very demy Island, which extendeth and stretcheth out between Pontus and Mæotis, is not about 87 miles and a halfe, and the breadth in no place lesse

lesse than two acres of land. This the paifants of that country do call Eione. The very coasts of this streight Bosphorus, both of Asia side and Europa, boweth and windeth like a curb to Mœotis. As touching the townes here planted, in the very first entry thereof standeth Hermonassa, and then Cepi, founded by the Milesians. Being past Cepi you come soone after to Stratilia, Phanagoria, and Aparuros, in manner vnpeopled and void: and last of all, in the very vtmost point of the mouth where it falleth into the sea, you arrive at the towne Cimmericus, named before-time Cerberian.

CHAP. VII.

¶ Nations about Mœotis.

Being passed Cimmericus, you come to the very broad lake Mœotis, whereof we spake before in the Geography of Europe. Vpon the coast wherof, beyond Cimmericus on the side of Asia, inhabite the Mœotici, Vati, Serbi, Archi, Zingi, and Plesij. After this, you come to the great riuer Tanais, which runneth into Mœotis with two armes or branches: and on the sides of it dwell the Sarmations, an off-spring descended in old time (as men say) from the Medians: but so multiplied now, that they themselves are diuided and dispersed into many nations. And first of all are the Sauromatæ, surnamed Gynacocratumeni, i. (as one would say) subiect to women: from whence the Amazones are provided and furnished of men to serue their turne in stead of husbands. Next to them, are the Euasæ, Cortæ, Cicimeni, Messeniani, Costobocci, Choatræ, Zigæ, Dandari, Thussageræ, and Turcæ, euen as far as the wildernes, forrests chafes, and rough vallies. But beyond them are the Arnuphæi, who confine vpon the mountaine Rhiphæi. As for as the riuer Tanais, the Scythians call it Silys: and Mœotis, they name Temerinda, that is to say, the mother of the sea, or rather, the seas end. In ancient time there stood a great towne vpon the very mouth of Tanais, where it falleth into the sea. As for the neighbour borders of this sea, inhabited they were sometime by the Lares: afterwards, by the Clazomenij, and Mœones: and in proceffe of time, by the Panticapenses. Some Authours write, that about Mœotis toward the higher mountaine Ceraunij, these nations following doe inhabit, to wit, first vpon the very coast and sea side, the Napææ: and aboue them, the Eßedones, joyning vpon the Colchy, and the high mountain [Corax.] After them, the Carmæes, the Oranes, Anticæ, Mazacæ, Alicantici, Acapæates, Agagammæ, Phycari, Rhimofoli, and Ascomarci. Moreouer, vpon the hill Caucasus, the Icatales, Imaduches, Ranes, Anelaks, Tydians, Charastasci, and Afuciandes. Moreouer, along the riuer Lagous, issuing out of the mountaines Cathei, and into which Opharus runneth, these nations ensuing do dwell, to wit, the Caucadians, and the Opharites: beyond whom runneth the riuer Menotharus, and Imitues, out of the mountaines Cissij, which passeth through the Agedi, Carnapes, Gardei, Accrifi, Gabri, and Gregari: and about the source or spring of this riuer Imitues, the people Imitui and Aparrheni. Others say, that the Suites, Auchetes, Saternei, and Asampates, invaded and conquered these parts; and that the Tanaites and Nepheonites, were by them put to the edge of the sword, and not one person of them spared. Some write, that the riuer Opharius runneth through the Canteci, and the Sapæi: and that the riuer Tanais trauesed sometime through the Phatareans, Herticei, Spondolici, Synthietæ, Amassij, Issi, Catareti, Tagori, Catoni, Neripi, Agandei, Mandarei, Saturechei, and Spalei.

CHAP. VIII.

¶ Cappadocia.

Hitherto haue wee treated and gone through the nations and inhabitants of the coasts vpon the Mediterranean sea. Now are wee to speake of the people inhabiting the very midland parts of the maine within: wherein I protest, and deny not, but that I will deliuer many things otherwise than the ancient Geographers haue set downe: forasmuch as I haue made diligent search into the state of those regions, as wel by enquiry of *Domitius Corbulo* (who lately went with an army through those quarters as of diuers kings and princes, who made repaire to Rome with futes and supplications, but especially of those kings sons that were left as hostages in Rome. And first to begin with the nation of the Cappadocians. This is a country that

A that of all others which bound vpon Pontus, reacheth farthest within the firm land; for on the left hand it passeth by both Armenias, the greater and the lesse, & Comagene: and on the right all those nations in Asia before-named, confining many others; and still preuailing with great might, growing on and climbing Eastward vp to the mountain Taurus, it passeth beyond Lycania, Pisidia, and Cilicia: and with that quarter which is called Cataonia, pierceth aboue the tract of Antiochia, and reacheth as far as to the region Cyrrethica, which lyeth well within that country. And therefore the length of Asia there, may containe 1250 miles, & the breadth 640.

CHAP. IX.

¶ Armenia the greater and the lesse.

The greater Armenia, beginning at the mountains Pariedri, is diuided from Cappadocia by the riuer Euphrates, as hath bin said before: & where the riuer Euphrates beginneth to turne his course from Mesopotamia, by the riuer Tigris as renowned as the other, both these riuers is it furnished withal, which is the cause that it taketh the name of Mesopotamia, as being situate between them both. The main land which lyeth between, is possessed by the mountains of Arabia called Orei: howbeit, it extendeth vntill it confine vpon Adiabene. Being past it once, it is hemmed in with mountains that encounter it ouerthwart, which cause it to enlarge it selfe into a bredth on the left hand, as far as to the riuer Cyrus: and then it turneth euer crosse, vntill it meet with the riuer Araxes: but it carrieth his length into the lesse Armenia, confining stil vpon the riuer Absarus, which falleth into the Ponticke sea: and the mountaines Pariedri (from which the said riuer issueth) which diuide it from the lesse Armenia. As for the riuer Cyrus, it springeth in the mountains Heniochij, which some called Coraxici. But Araxes issueth out of the same mountain from whence Euphrates commeth, and there is not aboue six miles space between them both. This riuer Araxes is augmented with the riuer Musis, and then himselfe loseth also his name, and as most haue thought, is carried by the riuer Cyrus into the Caspian sea: as for the townes of name in the lesse Armenia, they be these, Casarea, Asia, and Nicopolis. In the greater yee haue Arsamole, fast vpon the riuer Euphrates: likewise Carcathiocerta, situate vpon Tigris. In the higher country, is the city Tigranocerta, built in the plain beneath, neere to Araxes. *Ausidius* saith, that both the Armeniæ containe in all 500 miles. *Claudius Cesar* reporteth, that in length from Dascusa to the confines of the Caspian sea, it taketh 1300 miles, and in bredth halfe so much, to wit, from Tigranocerta to Iberia. This is wel knowne, that diuided it is into certain regiments, which they call Strategians; and yet some of them in old time, were as large each of them as realmes and kingdomes: and to the number they were of 120, but such barbarous names they had, that they cannot well be set downe in writing. Enclosed it is Eastward with the mountains, but neither the hills Ceraunij, nor yet the region Adiabene, do presently and immediatly confine thereupon: for the country of the Sopheni lyeth between: then you come to the mountaines aforesaid, and being past them, you enter into the country of the Adiabenes. But on that coast where the plaines lie and the flat vallies, the next neighbors to Armenia, be the Menobardi and Moscheni. As for Adiabene, enuironed it is partly with the riuer Tigris, and partly compassed with an vnaccessible steep mountaines. On the left hand, it confineth vpon the Medians, and hath a prospect to the Caspian sea, the which commeth out of the Ocean (as we shall shew in meet and convenient place) and is inclosed wholly within the mountains of Caucasus. As for the nations there inhabiting along the marches and confines of Armenia, now wil we speake of them.

CHAP. X.

¶ Albania, and Iberia.

All the plaine country between Armenia and the riuer Cyrus, the Albanois of Asia do inhabit. Being past it, you enter anon into the Iberians region, who are separated from the Albanois aforesaid by the riuer Alazon, which runneth downe from the Caucasian hills into Cyrus. The townes of importance, in Albania, is Cabalaca; in Iberia, Harmastis, neere to the riuer Neoris: beyond which, is the region Thasie, and Triare, as farre as vnto the mountaines

tains Partedori. And when you are past them, you enter into the desarts of Chelchis: and on the side of them which lyeth toward the Ceraunij, the Armenochalybes do inhabit: and so forward you come into the tract and marches of the Moschi, which extend to the river Iberus, that runneth into Cyrus. Beneath them, inhabit the Sacassani, and beyond them the Macronians, who reach euen to the river Abfarus. Thus you see how the plaines and the hanging of the hills in these parts are inhabited. Againe, from the marches and frontiers of Albania, all the forefront of the hills is taken vp and possessed by the sauage people of the Sylui; and beneath them, of the Lubienes, and so forward by the Didurians, and Sodij.

CHAP. XI.

¶ The gates and passages of the mountaine Caucasus.

When ye are beyond the Sodij, you come to the Streights of the hill Caucasus, which many haue erroneously called Caspiæ Portæ. And certes, Nature hath performed a mightie piece of worke, in cleauing asunder at one instant those mountaines, where the gates were barred vp as it were with iron portculleises, whiles vnder the mids thereof, the river Dyriodorus runneth: and on this side of it, standeth a strong fort and castle called Cumathia, scituate vpon a rock, able to impeach an army neuer so puissant & innumerable that would passe thereby; in such sort, as in this place by means of these bar-gates, one part of the world is excluded from the other: and namely most of all they seeme to be set opposite as a rampart against Harmastis a towne of Iberia. But being passed these said gates, you come to the mountaines Gordyei, where the Valli and Suarni, barbarous and sauage nations, are employed onely in the mines of gold. Beyond them as far as to the Ponticke sea, you enter into the countrey of the Heniochi, wherof be many forts, and soon after to the Achei. And thus much as touching this tract of the sea Ponticke, and of the most renowned gulfs of all others. Some haue set downe in writing, that between Pontus and the Caspian sea, it is not above 375 miles. *Cornelius Nepos* saith it is but 150. See into what great streights betweene both seas Asia is driuen again, and as it were thronged. *Claudius Caesar* hath reported, that from Cimmerius Bosphorus to the Caspian sea, it is 150 miles, and that *Seleucus Nicator* purposed if he had liued, to cut the land through from the one side to the other: but in this purpose of his, himselfe was cut short and slain by *Ptolemeus Ceraunus*. To conclude, it is in manner held for certain, that from those gates of Caucasus vnto the Ponticke sea, it is 200 miles, and no lesse.

CHAP. XII.

¶ The Islands in the Ponticke sea.

In the Ponticke sea lye the Islands Planctæ, otherwise Cyaneæ or Symplegades. Then Apollonia, named also Thynnias, for distinction sake from that other so named in Europe: it is from the continent one mile, and is in circuit three. Iust ouer-against Pharnacca, is the Isle Chalceritis, which the Greeks called Aria, consecrated as it were to Mars; wherein they say the foules that are, vsed to fight and flutter with their wings against all other birds that come thither.

CHAP. XIII.

¶ The Regions and people confining vpon the Scythian Ocean.

Having thus sufficiently discoursed of all the countries within the firme land of Asia, let vs now determine to passe ouer the Rhiphæan hills, and discover the coasts of the Ocean which lie on the right hand of those hills. Wherein we haue to consider, that Asia is dashed and beaten vpon by this maine sea on three parts: to wit, on the North side, and there it is called Scythicus: on the East, where they call it Eous: and last from the South, and there they name it Indicus. And according to the sundry gulfs and creeks that it maketh, and the inhabitants by whom it passeth, many names it taketh. Howbeit, a great part of Asia toward the North, lieth desart, and hath in it much wildernesse vnhabitable, by reason of the extreme cold of that frozen climat, so subiect to the Pole Artick, But being once past the vtmost quarter of the

A the North-point, and came to the North-East where the Sun ariseth at midsommer, then you come to the Scythians. Beyond whom, and the very point of the North-pole and the winde from thence, some haue placed the Hyperborei; of whom we haue spoken at large in the treatise of Europe. On this side the Hyperborei, the first cape or promontory that you meet withall in the countrey Celtica, is named Lytarmis: and then you come vnto the river Carambucis, where by the forcible influence of the starres, the high mountaine Rhiphæa, as being wearied, begin to settle and abase themselves lower. At the fall and descent of which mountaine, I haue heard say, that certain people named Arnupheæ inhabited: a nation not much vnlike in their manner of life to the Hyperboreans. They haue their habitations in forests; their feeding is vpon berries & trees: shorne they be all and shauen, for both men and women count it a shame to haue haire on their heads: otherwise they are ciuill enough in their conuersation and behavior: and therefore, by report, they are held for a sacred people and inuiolable, in so much as those cruell nations and inhumane that border vpon them, will offer them no abuse; neither do they respect them only, but also in regard and honour of them, they forbear those also that lie vnto them as to a place of franchise and priuilege. Go beyond them once, you come among the *Scythians indeed, the Cimimerij, Cicianthi, Georgi, and the nation of the Amazons, & these confront the Caspian or Hircan sea: for it breaks forth of the deep Scythian Ocean, toward the back parts of Asia, and takes diuers names of the inhabitants coasting vpon it, but especially about all other of the Caspians & Hircaneans. *Clitarchus* is of this opinion, that this sea is full as great and large as Pontus Euxinus. And *Eratoſthenes* sets downe the very measure and pourpriſe thereof: namely, from East to South along the coast of Cadusia and Albania, 5400 stadia: from thence by the Aratiatics, Amarbi, and Hircanij, to the mouth of the river Zoum, 4800 stadia: from it to the mouth of Iaxartes where it falleth into the sea, 2400 stadia: which being put together amount in all to 1575 miles. *Artemidorus* counteth lesse by 25 miles. *Agrippa* in bounding out and limiting the circuit of the Caspian sea, & the regions coasting vpon it, together with them Armenia both the greater and the lesse, namely, Eastward with the Ocean of the Seres, Westward with the mountaines of Caucasus; on the South side with the hill Taurus, and finally on the North with the Scythian Ocean, hath written, That the whole precinct and compass of these parts may contain in length [so far as is known & discovered of those countries] 590 miles, and 290 in breadth. Yet for all this, therewant not others who say, That the whole circuit of that sea, and begin at the very mouth and firth thereof, ariseth to 2500 miles. As for this mouth afore said where it breakes into the sea it is very narrow, but exceeding long: howbeit when it begins once to enlarge it selfe and grow wide, it turns and fetcheth a compass with horned points like to a quarter moone, and after the manner of a Scythian bow, as *M. Varro* saith, it windes along from his mouth toward the lake Mœotis. The first gulfe that it makes is called Scythicus; for the Scythians inhabit on both sides, and by means of the narrow streight between haue commerce and trafficke one with another: for of the one side are the Nomades and Sauromatæ, comprising vnder them many other nations of diuers names: and on the other, the Abzoæ, who haue no fewer states vnder them. At the very entry of this sea on the right hand, the Vdines, a people of the Scythians, dwell vpon the very point of this mouth: and then along the coast, the Albanois, a nation descended (as men say) from *Iafon*; where the sea lying before them is called Albanum. This nation is spread also vpon the mountaines of Caucasus, and so along downe the hills as far as to the river Cyrus, which confines the marches between Armenia and Iberia, as hath bin said. About the Maritime coasts of Albania & the Vdines country, the Sarmatians, called Vridors, and Aroteræ, are planted: and behinde them, the Amazones, whom we haue already shewed; who also are women Sauromatians. The rivers of Albani which fall into the sea, are Cassios and Albanos: and then Cambices, which hath his head in the Caucasian mountaine: and soon after Cyrus, which ariseth out of the hills Corax, as before is said. Moreouer *Agrippa* writes, that this whole coast of Albanie (fortified with those high and inaccessible mountaine of Caucasus) contains 425 miles. Now when you are past the river Cyrus, the Caspian sea begins to take that name, for that the Caspians doe inhabit the coasts thereof. And here the error of many is to be laid open and corrected, euen of those also who were in the last voyage with *Corbulo* in Armenia with the Romane armie: for they tooke it, that those gates of Caucasus whereof we spake before, were the Caspian gates, and so called them: and the verie mappes and descriptions which are painted and sent from thence, beare that name and title.

M

Likewise

* At this day, the Moscho-uites, white & black Rufians, Georgians, Amazonians, & the lesse Tartaries

Likewise the menacing commandements, and threatning commissions sent out by *Nero* the Emperour for to gaine and conquer those gates, which through Iberia lead into Sarmatia, made mention of the gates Caspia there, which had in a manner no passage at all to the Caspian sea, by reason that the mountaine Caucasus empeached it. Howbeit in very truth, there be other gates so called, which joine vpon the Caspian nations, which wee had neuer knowne from the other, but by relation of those that accompanied *Alexander* the Great in his voyage and expedition to those parts. For the realme and kingdom of the Persians, which at this day wee take that the Parthians hold, lyeth aloft betwene the Persian and Hircane seas vpon the mountaines of Caucasus, in the very hanging and descent thereof, on both sides confining vpon Armenia the greater: and on that part which lieth to Comagene, confronteth and joineth (as we haue said) vpon Sephenia: and vpon it againe bordereth Adiabene, where the realme of the Assyrians doth begin: whereof Arbelitis, which boundeth next vpon Syria, taketh vp a good part: which is the countrie wherein *Alexander* the Great discomfited and vanquished *Darius*. All this tract, the Macedonians who entered with *Alexander*, surnamed Mygdonia, for the resemblance of that in Greece from which they came. Townes of name there be in it, Alexandria, and Antiochia, which they call Nisibis: and from Artaxata it is 750 miles. There was also another citie called Ninus, or Niniue, seated vpon the riuer Tygris, which regarded the West, which in times past was highly renowned. But on the other side, where it lieth toward the Caspian sea, lieth the region Atropatene, separated by the riuer Araxes, from Otene in Armenia: wherein is the citie Gazæ, 450 miles from Artaxata: and as many from Ecbatana in Media, whereon some part the Atropatenes do hold.

CHAP. XIII.

¶ *Media, and the gates Caspia.*

AS for Ecbatana the head citie of Media, *Seleucus* the king founded it: and it is from Seleucia the great 750 miles, and from the Caspian gates 20. The other great towns of importance in Media, be Phausia, Agamzua, and Apamia, named also Rhaphane. And as for the streights there, called the Caspian gates, the same reason is there of that name, as of the other by Caucasus: by reason that the mountaine is clouen and broken through, and hath so narrow a lane, that hardly a waine or cart is able to passe by it; and that for the length of 8 miles: all done by the picke-axe and mans hand. The rockes and cliffs that hang ouer on the one side and the other, be like as if they were scorched and half burnt: so dry and thirsty is all that tract, and without fresh water for 38 miles space: for all the liquor and moisture issuing out of those craggie rockes, runneth through it, which letteth the passage, and causeth folke to auoid that way. Besides, such a number of serpents doe there haunt, that no man dare passe that way but in winter onely.

CHAP. XV.

¶ *Nations about the Hircane sea.*

VNTO Adiabene, joyneth the countrie of the Carduchy, so called in times past, and now Cordueni, by which the riuer Tigris runneth: and vpon them the Pratitæ do confine, called also Paredoni: who keepe the hold of the Caspian gates aforesaid. On the other side of whom, you shall meet with the deserts of Parthia, and the mountaine Cithenus: but being passed that once, you come straight into the most pleasant and beautiful tract of the same Parthia, called Choara; and there stand two cities of the Parthians, built sometimes as forts opposite against the Medians: namely, Calliope & Issatis, situate in times past vpon another rocke. As for the capitall citie of al Partia, Hecatompylos, it is from the Caspian gates aforesaid 133 miles. Thus you see how the kingdom of the Parthians also is limited & separat by these mountaines and streights. When a man is once gotten forth of these gates, presently he enters vpon the Caspian countrie, which reacheth as far as to the sea side, and gaue the name as well to it as to the gates aforesaid. Howbeit al the region vpon the left hand is full of mountains from whence backward to the riuer Cyrus, are by report 220 miles, but from that riuer if you would go higher vp to those gates, you shall find it 700 miles. And in very truth from this place began *Alexander* to make the account and reckoning of his iournies, in that voyage of his to India,

A India, saying, that from those gates to the entrance of India, it was 15680 stadia: from thence to the city Bacha, which they call Zariafpa 3700, and so to the riuer Iaxartes 5 miles.

CHAP. XVI.

¶ *Other Nations also.*

FROM the Caspian countrie Eastward, lieth the region called Zapanortene, & in it the land Daricum, the most fertile tract of all those parts. Then come you to the Tapyrians, Anariaci, Stauri and Hircani, at whose coasts the same sea begins to take the name Hircanum, euen from the riuer Syderis. About it are other riuers, to wit, Mazeras and Stratos, all issuing out of Caucasus. Out of the realme of Hircania, you enter into the countrie Margiana, so commendable for the warme Sun-shine weather there, and the only place in all that quarter which yeeldeth vines. Enuironed it is on euery side with goodly pleasant hills to the cie, for the compass of 1500 stadia. Fortified it is besides, and affordeth hard access vnto it by reason of the sandy and barren deserts for the space of 120 miles. And scituate it is euen against the tract of Parthia, wherein *Alexander* the Great sometime had built Alexandria, which beeing rased and destroyed by the Barbarians, *Antiochus* the son of *Seleucus* re-edified in the same place vpon the riuer Margus, which runs through it, together with another riuer Zodale, and it was called Syriana [or rather Seleucia.] Howbeit, he desired rather that it should be named Antiochia. This citie containeth in circuit 70 stadia: and into it, *Orodes* after that he had defeated *Craffus* & his host, brought all the Romans whom he had taken prisoners. Being past the high countrie Margiana, you come to the region of Mardi, a fierce & sauage people, subiect vnto none, they inhabit the mountain Caucasus, and reach as far as to the Baetrians. Beyond that tract are these nations, the Ochanes, Chomares, Berdriget, Hermatotrophi, Bomarci, Commani, Marucæi, Mandrueni and Iatij. The riuers also Mandrus and Gridinus. Beyond inhabit the Chorasmij, Gandari, Atafini, Paricani, Sarangæ, Parafini, Maratiani, Nasotiani, Aorsi, Gelæ, whom the Greeks called Cadufij, and the Matiani. Moreouer, in it stood the great towne Heraclea, built by *Alexander* the Great, which afterwards was subuerted and ouerthrowne: but when it was repaired again by *Antiochus*, he named it Achais. Beneath in the country, the Derbines do inhabit, thorough whose marches in the very midst runneth the riuer Oxus, which hath his beginning out of a lake called Oxus. Beyond them are the Symataæ, Oxij, Tagæ, Heniochi, Bateni, Saraparæ, and Baetrians, with their towne Zariafpe, called afterwards Baetrum, of the riuer Baetra. This nation inhabiteth the back parts of the hill Paropamisus, ouer against the source & spring of the riuer Indus, & is enuironed with the riuer Ochus. Beyond the Baetrians are the Sogdianes, & Panda the principal city of that country. In the very most marches of their territory standeth the town Alexandria built by *Alexander* the Great, wherein are to be seen the altars and columns, erected by *Hercules*, prince *Bacchus*, *Cyrus*, *Semiramis*, and *Alexander*: supposed and taken to be the very end of all their voiaages in that part of the world, resting within the riuer Iaxartes, which the Scythians call Silys. For *Alexander* and his soldiers thought it had bin Tanais. Howbeit, captain *Demonax*, who serued vnder the kings *Seleucus* and *Antiochus*, passed over that riuer with an army, and at the end of his voiage set vp altars vnto *Apollo Didymus*. And the *Demonax* we follow, especially in this description and Geographic of ours.

CHAP. XVII.

¶ *The Scythian Nation.*

BEYOND the realm Sogdiana, inhabit the Nations of the Scythians. The Persians were wont to call them in general Sacas, of a people adioyning vnto them, so named. In old time they were known by the name of Arameans. And on the other side, the Scythians for their part vsed to term the Persians, Chorsari: and the hill Caucasus, they called Graucalus, that is to say, white with snow. The principal nations of Scythia, be the Saræ, Massagetæ, Dahæ, Essedonæ, Ariacæ, Rhymnici, Pefici, Amordi, Histi, Edones, Camæ, Camacæ, Euchatæ, Cotieri, Antariani, Pialæ, Arimaspi beforetime called Acidiri, Afei & Oetei. As for the Napæans & Apelæans who sometime dwelt there, they be vtterly extinct and gone. The riuers there of name be Mandagræus and Caspius. And surely there is not a region wherein Geographers doe varie

and disagree more than in this: and as I take it, this commeth of the infinit number of those nations, wandering to & fro, and abiding neuer in one place. *Alexander* the Great and *M. Varro* make report, that the water of the Scythian sea is fresh in taste, & potable. And in truth *Pompey* the great had such water brought vnto him from thence to drink, when he waged war thereby against *Mithridates*: by reason no doubt of the great riuers that fall into it, which overcome the saltnesse of the water. *Varro* saith moreover, That during this expedition and iourney of *Pompeius*, it was for certain knowne, that it is but seuen daies iourney from out of India to the *Bactrians* country, euen as far as to the riuier *Icarus* which runneth into *Oxus*: and that the merchandise of India, transported by the *Caspian* sea, and so to the riuier *Cyrus*, may be brought in fife daies by land as far as to *Phasis* in *Pontus*. Many Islands there lie all ouer that sea: but one above the rest, and most renowned, is *Tazata*; for thither all the shipping from out of the *Caspian* sea and the *Scythian* Ocean, do bend their course & there arriue; for that all the sea coasts do affront the *Leuant*, and turn into the East. The frontiers of *Scythia* from the first cape thereof is vnhabitable by reason of the snow that lies continually: neither are the next regions inhe-
 to frequented and tilled, for the barbarous crueltie of those nations that border vpon it: such as the *Anthropophagi*, who liue of mans flesh, and haunt those parts. Hereupon it commeth, that you shall find nothing there but huge defart forests, with a number of wild beasts, lying in wait for men as sauge as themselves. When you are past this region, you enter againe amongst the *Scythians*, where you shall find likewise a wilde-nes ful of wild beasts, euen as far as to the promontory & mountain called *Tabis*, which regardeth the sea. In such sort as one moitie in manner of that coast, all along which looketh toward the East, lieth wast, and is not inhabited. The first people of any knowledge and acquaintance be the *Seres*, famous for the fine silk that their woods do yeeld. They kemb from the leaues of their trees the hoary downe thereof, and when it is steeped in water, they card and spin it, yea, and after their manner make thereof a sey or web, whereupon the dames here with vs haue a double labour both of vndoing, and also of weaving again this kind of yearn. See what ado there is about it, what labour and toile it costeth, & how far fet it is; and all for this, that our ladies and wiues when they go abroad in the street may cast a lustre from them, and shine again in their silks and veluets. As for the *Seres*, a mild and gentle kind of people they are by nature: howbeit, in this one point they resemble the bruit and wild beasts, for that they cannot away in the commerce with other nations, with the fellowship and society of men, but shun and auoid their company, notwithstanding they desire to * traf-
 ficke with them. The first riuier known among them is *Psitars*: the next to it *Carabi*: the third *Lanos*: and then you come to a cape of that name. Beyond it is the gulfie *Chryse*, the riuier *At-
 tans*, and another bay or creeke called *Attanos*. By it lyeth the region of the *Attaci*, a kind of people, secluded from all noisome wind & aire, keeping vpon hils, exposed to the pleasant sun-
 shine, where they inioy the same temperature of aire that the *Hyperboreans* liue in. Of this country and people, *Amonetus* hath written a seuerall booke of purpose: like as *Heratens* hath compiled such another treatise of the *Hyperboreans*. Beyond the *Attaci* or *Attacores*, the *Thy-
 rians* and *Tocharians* do inhabit; yea, and the *Casirians*, who now by this time belong to the *Indians*, & are a part of them. But they within forth that lie toward the *Scythians*, feed of mans
 flesh. As for the *Nomades* of India, they likewise wander to & fro, and keep no resting place. Some write, that they confine vpon the very *Ciconians* and *Brytians* on the North side. But
 there (as all Geographers do agree) the mountains *Emodi* arise and shoot vp: and there entereth
 the country of the East *Indians*, and extendeth not only to that sea, but also to the Southerne,
 which we haue named the *Indian* sea. And this part of the *Oriental* *Indians*, which lieth di-
 rectly straight forth, as far as to that place where India beginneth to twine and bend toward
 the *Indian* sea, containeth 1875 miles. And all that tract which windeth and turneth along the
 South, taketh 2475 miles (as *Erastosthenes* hath collected & set downe) euen vnto the riuier
Indus, which is the vtmost limit of India West-ward. But many other writers haue set downe the
 whole length of India in this manner, namely, that it requireth 40 daies and nights sailing, with
 a good gale of a forewind: also, that from the North to the South coast thereof, is 2750 miles.
 Howbeit, *Agrippa* hath put down in writing that it is 3003 miles long, and 2003 broad. *Posido-
 nius* took measure of it from the Northeast to the Southeast: & that by this means it is direct-
 ly opposit vnto *Gaule*, which he likewise measured along the West coast, euen from the North
 west point where the Sun goeth down at Mid-summer, to the South-west where it setteth in the

* Euen at this day they set a-broad their wares with the prices vpon the shore, and goe their waies: the forrain merchants come and lay downe the money, and haue away the merchandise: and so depart without any communication at all.

A in the midst of Winter. He addeth moreover and saith, That this West wind which from be-
 hind *Gaule* bloweth vpon India, is very healthsome & wholsome for that country, and this he
 proued by very good reason & demonstration: and verily the *Indians* haue a far different aspect
 of the sky from vs. Other stars rise in their Hemisphere, which we see not. Two Summers they
 haue in one yere, and as many haruests: and their winter between hath the *Etesian* winds blow-
 ing in our dog-daies, in stead of the Northern blasts with vs. The winds are kind and mild with
 them: the sea alwaies nauigable: the nations there dwelling, & the cities and towns there built,
 innumerable, if a man would take in hand to reckon them all, for India hath bin discovered, not
 only by *Alexander* the great his mighty and puissant army, and by other kings his successors (&
 namely *Seleucus* and *Antiochus*, and their Admirall *Patrocles*, who sailed about it euen to the
Hircane and *Caspian* seas: but also by diuers other Greek Authors, who making abode, & so-
 journeying with the kings of India (like as *Megasthenes* and *Dionysius* sent thither of purpose from
Philadelphus) haue made relation of the forces which those nations are able to raise and main-
 tain. And yet further diligence is to be imployed still in this behalfe, considering they wrote of
 things there so diuers one from another, and incredible withall. They that accompanied *Alex-
 ander* the great in his Indian voiage, haue testified in their writings, that in one quarter of India
 which he conquered, there were of towns 500 in number, and not one lesse than the city *Cos*:
 of feuerall nations nine. Also that India was a third part of the whole earth: & the same so well
 inhabited, that the people in it were innumerable. And this they said (beleeue mee) not with-
 out good apparance of reason; for the *Indians* were in manner the onely men of all others that
 neuer went out of their own country. Moreover, it is said, That from the time of *Bacchus* vnto
 C *Alexander* the Great, there reigned ouer them successiue 154 kings, for the space of 5402 yeres
 between, and 3 moneths ouer. As for the riuers in that country, they be of a wonderfull bignes.
 And reported it is, that *Alexander* sailed euery day at the least 600 stadia vpon the riuier *Indus*,
 and yet in lesse than fife moneths and some few daies ouer, he could not come vnto the end of
 that riuier, and lesse it is than *Ganges* by the confession of all men. Furthermore, *Seneca* a Latine
 writer, assaied to write certain commentaries of India: wherein he hath made report of 60 Ri-
 uers therein, and of nations 120 lacking twaine. As great a labour it were to reckon vp & num-
 ber the mountains that be in it. As for the hils *Imaus*, *Emodius*, *Paropamisus*, as parts all and
 members of *Caucasus*, but one vpon another, and conioine together. And being past them yee
 D go downe into a mighty large plain country, like to *Egypt*. It remaineth now to shew the con-
 tinent and firm land of this great country, and for the more evident demonstration, let vs fol-
 low the steps of *Alexander* the great, and his Historiographers, *Diogenes* and *Belon*, who set down
 all the gaits and iournies of that prince, haue left in writing, That from the *Caspian* ports vn-
 to the city *Hecatompylos* which is in *Parthia*, there are as many miles as we haue set down al-
 ready. From thence to *Alexandria* in the *Ariane* country (which city the same king founded)
 562 miles: from whence to *Prophthasia* in the *Dranganes* land, 199 miles: & so forward to the
 capitoll towne of the *Arachosians*, 515 miles. From thence to *Orthospanum*, 250 miles: last of
 all, from it to the city of *Alexandria* in *Opianum*, 50 miles. In some copies these numbers are
 found to vary and differ. But to return to this foresaid city, (scituate it is at the very foot of *Cau-
 casus*, from which to the riuier *Chepta* and *Pencolaitis*, a town of the *Indians*, are counted 227
 E miles. From thence to the riuier *Indus* & the towne *Tapila*, 60 miles: and so onward to the no-
 ble and famous riuier *Hidaspes*, 120 miles: from which to *Hypasis*, a riuier of no lesse account
 than the other, 4900, or 3900. And there an end of *Alexanders* voiage: howbeit, he passed ouer
 the riuier, and on the other side of the bank, he erected certaine altars and pillars, and there de-
 dicated them. The letters also of the king himselfe, sent back into Greece, do cary the like cer-
 tificate of his iournies, and agree iust herewith. The other parts of the country were discovered
 & surueied by *Seleucus Nicator*, namely from thence to *Hefudrus* 168 miles: to the riuier *Ioanes*
 as much: & some copies adde 5 miles more therto: from thence to *Ganges* 112 miles: to *Rho-
 dapha* 119, & some say, that between them two it is no lesse than 325 miles. From it to *Calini-
 paxa*, a great town, 167 miles: & an half: others say, 265. And so the confluent of the riuers *Io-
 manes* & *Ganges*, where both meet together, 225 miles, & many put therto 13 miles more: from
 F thence to the town *Palibotta* 425 miles: & so to the mouth of *Ganges* where he falleth into the
 sea, 628 miles. As for the nations, which it pains me not to name, from the mountains *Emodi*,
 & the principal cape of them, *Imaus*, which signifies in that country, language ful of thow, they be

be these: the Isari, Cofyri, Izgi, and vpon the very mountains, the Ghiforofagi: also the Brach. **G** manæ, a name common to many nations, among whom are the Maccocalingæ. Of riuers besides, there are Pinna & Cainas, the later of which twain runneth into Ganges, & both are nauigable. The people called Calingæ, coast hard vpon the sea. But the Mandeï & Malli, among whom is the mountain Mallus, are about them higher in the country. And to conclude, then you come to Ganges, the farthest bound and point of all that tract, India.

CHAP. XVIII.

¶ The riuer Ganges.

MAny traue bin of opinion, & so haue written, that the spring of Ganges is vncertain, like **H** as that also of Nilus: and that he swelleth, ouerfloweth, and wate: eth all the countries whereby he passeth, in the same sort that Nilus doth. Others again haue said that it issueth out of the mountains of Scythia: & how into it there run 19 other great riuers: of which ouer and aboue those before named, certain are nauigable; namely, Canucha, Vama, Erranoboa, Cofogus, and Sonus. There be also that report, that Ganges presently ariseth to a great bignesse of his owne sources and springs, and so breaketh forth with great noise and violence, as running downe with a fall ouer craggy and stony rocks: and when he is once come into the flat plains and euen country, that he taketh vp his lodging in a certain lake; and then out of it carrieth a mild and gentle stream, 8 miles broad where it is narrowest; and 100 stadia ouer for the most part, but 160 where he is largest: but in no place vnder 20 paces deep, [i. a 100 foot.]

CHAP. XIX.

¶ The nation of India, beyond the riuer Nilus.

When ye are ouer Ganges, the first region vpon the coast that you set foot into, is that of the Gandaridæ and the Calingæ, called Parthalis. The king of this country hath in ordinance for his wars 80000 foot, 1000 horse, and 700 Elephants, ready vpon an **K** houres warning to march. As for the other nations of the Indians that liue in the champion plaine countries, there be diuers states of them, of more ciuility than the mountainers. Some apply themselves to tillage and husbandry: others set their minds vpon martiall feats: one sort of them practise merchants trade, transporting their owne commodities into other countries, and bringing in forrein merchandise into their own. As for the nobility and gentry, those also that are the richest and mightiest among them, they manage the affaires of State and Commonweale, and sit in place of justice, or els follow the court, and sit in counsell with the king. A **L** fit estate there is besides in great request, & namely of Philosophers & Religions, giuen wholly to the study of wisdom & learning; and these make profession of voluntary death: and verily when they are disposed to die at any time, they make a great funerall fire, cast themselves into it, and so end their daies. Besides all these, one thing there is among them halfe brutish, and of exceeding toile and trauell (and yet it is that which partly maintaineth all the other estates abouesaid) namely, the practise of hunting, chasing and taming Elephants. And in very truth, with them they plow their ground, vpon them they ride vp & down: with these beasts are they best acquainted, they serue in the wars for maintenance of their liberty, and defence of their frontiers against all inuasion of enemies. In the choise of them for war-seruice, they regard and consider their strength, their age, and bignesse of body. But to leaue them. An Island there is within the riuer Ganges, between two arms thereof, of great largenesse and capacity, which receiue one nation by it selfe, apart from others, & named it is Modogalica. Beyond it are seated the Modubians and Molindians, where standeth the stately city Molinda, situated in a plentiful and rich soile. Moreouer, the Galmudroefians, Pretians, Calissæ, Safuri, Fassalæ, Colubæ, Orxulæ, Abali, and Taluctæ. The king of these countries hath in ordinary for his wars 50000 **M** foot, 3000 horse, and 400 Elephants. Then you enter into a country of a more puissant & valiant nation, to wit, the Andarians, planted with many villages well peopled: and moreover with 30 great townes, fortified with strong walls, towers, and bastiles. These find and maintain preft & ready to serue the king in his wars, an Infantry of 100000 foot, a Cauallery of 2000 horse, and 100 Elephants besides, well appointed. Of all the regions of India, the Dardanian country

A is most rich in gold mines, and the Selian in siluer. But about all the nations of India thorow out, and not of this tract and quarter only, the Prasij far exceed in puissance, wealth, and reputation; where the most famous, rich, and magnificent city Palibotria stands, whereof some haue named the people about it, yea and all the nation generally beyond Ganges, Palibotrians: their king keeps continually in pay 600000 foot men, and 30000 horsemen, and 9000 Elephants euery day in the yere, whereby you may soongesse the mighty power & wealth of this prince. Beyond Palibotria, more within the firme land, inhabit the Monedes and Suari, where standeth the mountain Maleus: and there for six moneths space the shadowes in winter time fall Northward; and in summer season go into the South. The pole Arcticke starres in all that tract are seen but once in the yere, and that no longer than for 15 daies, as *Beton* reporteth. But *Megasthenes* writeth, that this is vsuall in other parts of India. The Antartique or South pole the Indians call Dromosa. As for the riuer Iomanes, which runs into Ganges, it traueseth through the Palibotrians country, and passeth between the townes Methora and Cyrisoborca. Beyond the riuer Ganges, in that quarter and clymate which lieth Southward, the people are caught with the Sun, and begin to be blackish, but yet not all out so sun-burnt and blacke indeed as the Æthyopians and Moores. And it seemeth, that the neerer they approach to the riuer Indus, the deeper coloured they are and tanned with the Sun: for you are not so soone past the Prasians country, but presently you are vpon Indus: and among the mountaines of this tract, the Pygmæans, by report, do keepe. *Artemidorus* writeth, that betwene these two riuers there is a distance of 21 miles.

CHAP. XX.

¶ The riuer Indus.

The great riuer Indus, which the native people call Sandus, issueth out of a part or dependence of the hill Caucasus, which is called Paropamisus: hee takes his course and runs full against the Sun rising, and makes 19 riuers more to lose their names, which he takes in vnto him: among which the principall are these, Hydaspis one, bringing with him 4 more: and Cantabra another, accompanied with 3 besides. Moreouer, of such as are of themselves nauigable, without the help of others, Acesines, and Hypasis. And yet for all their additions, the riuer of Indus (such a sober and modest course as it were his waters keepe) is in no place either **D** about 50 stadia ouer, or 15 paces, i. 75 foot, or 12 fathom and halfe deep. This riuer incloseth within two branches of it, a right great Island named Prasiane, and another that is lesse, called Patale. As for himselfe, they that haue written the least of him say he beareth vessels for 1240 miles: and turning with the course of the Sun, keepeth him company Westward vntill hee is discharged into the Ocean. The measure of the sea coast from Ganges vnto him I wil expresse generally and in grosse, as I find it written, albeit there is no agreement at all of Authors touching this point. From the mouth of Ganges where he entrench into the sea, vnto the cape Caluigon and the towne Dandagula, are counted 725 miles: from thence to Tropina 1225 miles. Then to the promontorie Perimula, where stands the chiefe mart or towne of merchandise in all India, they reckon 750 miles: from which to the towne aboue-said Patale within the Isle, **E** 620 miles. The mountainers inhabiting betwixt it and Iomanes, are the Cesti and Celiboni, wilde and sauage people: next to them the Megallæ, whose king hath in ordinary preft for seruice 500 Elephants, of foot and horse a great number, but vncertaine it is how many, sometime more, sometime fewer. As for the Chryseans, Parafangians, and Afangians, they are full of the wilde and cruell Tygers: they are able to arme 30000 foot and 800 horse, and to set out with furniture 300 Elephants. This country is on three sides enuironed and inclosed with a range of high mountaines, all desert and full of wildernes for 625 miles, and of one side confined with the riuer Indus. Beneath those wilde hills you enter among the Dari & Suræ: then you come againe to waste desarts for 188 miles, compassed about for the most part with great bars and banks of sand, like as the Islands with the sea. Vnder these desert Forrests you shall meet **F** with the Maltecores, Cingians, Marobians, Rarungians, Morantes, Masuæ, and Pangungæ. Now for those who inhabit the mountains, which in a continuall range without interruption stand vpon the coasts of the Ocean, they are free States and subiect to no Prince, and many fair townes and cities they hold among these cliffes and craggy hills. Then come you to the Næmans,

rans, inclosed within the highest mountaine of all the Indian hills, Capitalia. On the other side of this mountaine great store there is all ouer it, of gold and siluer mines, wherein the Inhabitants do dig. Then you enter vpon the kingdom of Oratura, whose king indeed hath but ten Elephants in all, howbeit a great power of footmen. And so forward to the Varetates, who vnder their King keepe no Elephants at all for his seruice, trusting vpon their Cauallery and Fanterie, wherein they are strong. Next to them the Odomboerians & Salabastres, where standeth a goodly faire city called Horata, enuironed and fortified with deepe fosses and ditches full of standing water: wherein there keepe a great number of Crocodiles, which for the greedy appetite to deuoure mens bodies, wil suffer none to passe into the town but ouer the bridge. Another towne there is besides among them, of great name and importance, to wit, Automela, standing vpon the sea side: and otherwise much resort there is vnto it of merchants from all parts, by reason of 5 great riuers which meet all there in one confluence. Their king maintains in ordinary 1600 Elephants, 150000 footmen, and 5000 horse. The king of the Charmians is but poore to speake of: his strength lieth in 60 Elephants, for his power otherwise is but smal. Being past that realme, you come into the country of the Padians, the only nation of all the Indians, which is gouerned by women. One of this sex, they say, was begotten somtime by *Hercules*, in which regard she was the better accepted, and had the prerogative of the regencie ouer the greatest kingdome. From her the other Queens fetch their pedigree, and haue the dominion and rule ouer 30 great townes, and the command of 150000 foot, and 500 Elephants. Beyond this realme you come to the nation of the Syrieni, containing 300 Cities: and from them to the Deraugæ, Pofunge, Bugæ, Gogyarei, Vmbræ, Nereæ, Brancosi, Nobundæ, Cocondæ, Nefei, Pedatritæ, Solobriæ, and Olostræ, who confine vpon the Island * Patale: from the vtmost point of which Iland vnto the gates Casoiæ, are reckoned 18035 miles. Now on this side the riuier Indus, iust against them, as appeareth by euident demonstration, there dwell the Amatæ, Bolingæ, Gallitalutæ, Dimuri, Megari, Ordabæ, and Mefæ. Beyond them the Vri and Sileni, and then you come to the deserts for 250 miles: which hauing passed ouer, you shall meet with the Organages, the Abaorts, Cibaræ, and the Suertæ: and beyond these, a wilderness againe as great as the former. Passe on farther, you come among the Sarpophages, Sorgæ, Baraomatæ, and the Gunbretes, of whom there be 13 seuerall nations, and each one hath two great cities apiece. As for the Aseni, they people three cities: their capitall city is Bucephalia, built in the very place where king *Alexanders* horse called *Bucephalus* was interred. Aboue them are the mountainers on the rising of the hill Caucasus, named Soleadæ, and Sondæ: and when you are on the other side of the riuier Indus, as you go along the coast and banks thereof, you shall see the Samarabrians, the Sambrucenes, the Brisabrites, Olij, Autixeni, and Taxillæ, with a famous city called Amandra, of which all that traſt now lying more flat and plaine within the country is named Amandria. Foure other nations there be besides of Indians, the Peucolaitæ, Arfagalites, Geretes, and Aſei: for many of the Geographers set not down Indus the riuier, for to determine the marches of the Indians Westward; but lay thereto foure other prouinces and seuerall feignories, to wit, of the Gedrosians, Arachotes, Arii, and Paropamisades.

CHAP. XXI.

¶ *The Arii, and other nations depending vnto them.*

Other writers are of opinion, that the vtmost frontier and limit of India is the riuier Coſphetes, and both it and all those quarters are included within the territorie of the Arii; yea and most of them affirme, that the city Nyſa, as also the mountaine Merus consecrated to god *Bacchus*, belong vnto India as parcels thereof. This is that mountaine whereof arose the poeticall fable, That *Bacchus* therein was borne, and issued out of *Iupiters* thigh. Likewise they assigne and lay to India the country of the Aspogores, so full of vines, laurel, and box, and generally of all sorts of apple trees and other fruitfull trees that grow within Greece. Many strange, wonderful, and in manner fabulous things they report of the fertilitye of that land, of the diuers sorts of corne, of trees bearing cotton, of wilde beasts, of birds, and other creatures there breeding and liuing: which because they are not properly belonging to this Treatise now in hand, I will referue them for another part of this Worke, and write more particularly

Early of them in their due and seuerall places. And as for those 4 prouinces which I touched before, I will speake of them anon: for now I hasten and thinke it long vntill I haue said somewhat of the Island Taprobane. And yet before I come to it there be other Isles which I cannot passe by, and namely that of Parala, which I noted to ly in the very mouth of the riuier Indus, and it carrieth the forme and shape of a triangle figure, and is 220 miles long. Without the mouth of the riuier Indus two other Isles there be, Chryse and Agyræ, so named (as I thinke) of the gold and siluer mines which they do yeeld: for I cannot easily beleue, that the very earth and soile there is all gold and siluer entire, as some haue made report. Twenty miles from them lieth the Isle Crocala: and 12 miles farther into the sea, Bibaga, where of oysters and other shell fishes called Purples are found good store. And last of all, 9 miles beyond it, Toralliba shewes it selfe, and many other petty Islands of no regard.

CHAP. XXII.

¶ *The Island Taprobane.*

It hath bene of long time thought by men in antient daies, That Taprobane was a second world, in such sort as many haue taken it to be the place of the Antipodes, calling it the Antichthonos world. But after the time of *Alexander* the Great, and the voiage of his army into those parts, it was discovered and knowne for a truth, both that it was an Island, and what compass it bare. *Onesicritus* the Admiral of his fleet hath written, that the Elephants bred in this Island be bigger, more fierce and furious for war seruice than those of India. *Megasthenes* saith there is a great riuier which parteth it in twaine, and that the people thereof dwelling along the riuier be called Palæogoni: adding moreover, that it affordeth more gold and bigger pearles by farre than India doth. *Eratosthenes* also tooke the measure thereof, and saith, that in length it beareth 7000 stadia, and in bredth 5000: that in it there be no cities or great towns, but villages to the number of 700. It begins at the Levant sea of Oriental Indians, from which it stretcheth and extendeth between the East and West of India; and was taken in times past to ly out into the sea from the Præsians country 20 daies sailing. But afterwards, for that the boats and vessels vsed vpon this sea in the passage thither, were made & wound of paper reeds like those of the riuier Nilus, and furnished with the same kinde of tackling, the voiage thither from the foresaid country was gaged within a lesse time: and well knowne it was, that according to the faile of our ships and gallies, a man might arriue there in 7 daies. All the sea lying between is very ebbe, full of shallowes and shelues, no more than 5 fathom deepe: howbeit in certain chanel that it hath, it is so deep that it cannot be sounded, neither wil any anchors reach the bottom, and there rest; and withall, so streight & narrow these chanel are, that a ship cannot turne within them: and therefore to auoid the necessitie of turning about in these seas, the ships haue prows at both ends, and are pointed each way: in sailing they obserue no star at all. As for the North pole, they neuer see it: but they carry euer with them certaine birds in their ships, which they send out oft times when they seeke for land, euer obseruing their flight: for knowing well that they wil fly to land, they accompany them, bending their course accordingly: neither vse they to saile more than one quarter of a yeare: and for 100 daies after the Sun is entred into Cancer, they take most heed, and neuer make faile: for during that time it is winter with them. And thus much we come to knowledge of, by relation of antient Writers. But we came to far better intelligence, and more notable information, by certain Embassadors that came out of that Island, in the time of *Claudius Cesar* the Emperor: which happened vpon this occasion, and after this manner; It fortuned that a free slave of *Annius Plocamus*, (who had farmed of the Exchequer the customs for impost of the red sea) as he made saile about the coasts of Arabia, was in such wise driven by the North windes besides the realme of Carmania, and that for the space of 15 daies, that in the end he fell with an harbour thereof called Hippuros, and there arriued. When he was set on land, he found the King of that Countrey so courteous that hee gaue him entertainment for six moneths, and entreated him with all kindnesse that could be deuised. And as he vsed to discourse and question with him about the Romanes and their Emperour, he recounted vnto him at large of all things. But amongst many other reports that he heard he wondred most of all at their iustice in all their dealings, & was much in loue therewith, and namely, that their Deniers of the money which was taken, were alwaies of like

like weight, notwithstanding that the sundry stamps and images vpon the pieces shewed plainly that they were made by diuers persons. And hereupon especially was he moued & sollicitated to seeke for the alliance and amitie of the people of Rome: and so dispatched 4 Embassadors of purpose, of whom one *Rachias* was the chiefe and principall personage. By these Embassadors we are informed of the state of that Island, namely, that it contained fise hundred great townes in it: & that there was a haueyn therein regarding the South coast, lying hard vnder Palefimumdum the principall citie of all that realme, and the kings seat and pallace: that there were by iust account 200000 of commoners & citizens: moreouer, that within this island there was a lake 270 miles in circuit, containing in it certain Islands good for nothing else but pasturage, wherein they were fruitfull; out of which lake there issued 2 riuers, the one, Palefimumdas, passing neere to the citie abovesaid of that name, and running into the haueyn with three streames, whereof the narrowest is fise stadia broad, and the largest 15; the other Northward on India side, named Cydara: also that the next cape of this country to India is called Colaicum, from which to the neereft port of India is counted foure daies failing: in the midst of which passage, there lieth in the way, the Island of the Sunne. They said moreouer, that the water of this sea was all of a deepe Greene colour; and more than that, full of trees growing within it: as much as the pilots with their helmes many times brake off the heads and tops of those trees. The stars about the North-pole, called Septentriones, the Waines or Beares, they wondred to see here among vs in our Hemisphere: as also the Brood-hen, called *Vergilia* in Latine, as if it had been another heauen. They confessed also they neuer saw with them, the Moone about the ground before it was 8 daies old, nor after the 16 day. That the Canopus, a goodly great and bright star about the pole Antarticke, vsed to shine all night with them. But the thing that they maruelled and were most astonied at was this, that they obserued the shadow of their own bodies fell to our Hemisphere, and not to theirs; and that the Sun arose on their left hand, and set on their right, rather than contrariwise. Furthermore they related, that the front of that Island of theirs which looked toward India, contained 10000 stadia, & reached from the South-East beyond the mountains Enodi. Also, that the Seres were within their kenning, whom they might easily discouer from out of this their Island; with whom they had acquaintance by the meanes of trafficke and merchandise: and that *Rachias* his father vsed many times to trauell thither. A firming moreouer, that if any strangers came thither, they were encountred and assailed by wild & sauage beasts: and that the inhabitants themselves were gyants of stature, exceeding the ordinary stature of men, hauing red haire, eyes of colour blewish, their voice for sound horrible, for speech not distinct nor intelligible for any vse of traffick and commerce. In all things else their practise is the same that our merchants and occupiers do vse: for on the farther side of the riuier, when wares and commodities are laid downe, if they list to make exchange they haue them away, and leaue other merchandise in lieu thereof to content the forreine merchant. And verily no greater cause haue we otherwise to hate & abhor this excessive superfluitie, than to cast our eie so far and consider with our selues, what it is that we seeke for, from what remote parts we fetch it, and to what end we so much desire al this vanitie. But euen this Island Taprobane, as farre off as it is, seeming as it were cast out of the way by Nature, and diuided from all this world wherein we liue, is not without those vices and imperfections wherewith we are tainted and infected. For euen gold & siluer also is there in great request and highly esteemed: and marble, especially if it be fashioned like a tortois shell. Iemmes and pretious stones; pearles also, such as be orient and of the better sort, are highly prized with them: and herein consisteth the very height of our superfluous delights. Moreouer, these Embassadors would say, that they had more riches in their Island, than we at Rome, but we more vse thereof than they. They affirmed also, that no man with them had any slaues to command: neither slept they in the morning after day-light, ne yet at all in the day time. That the maner of building their houses was low, somewhat raised aboue the ground, and no more adoe: that their markets were neuer deare, nor price of victuals raised. As for courts, pleading of causes, and going to law, they knew not what it meant. *Hercules* was the onely god whom they worshipped. Their king was alwaies chosen by the voices of the people: wherein they had these regards; that hee were aged, milde, and child lesse: but in case he should beget children afterward, then hee was deposed from his regall dignitie, to the end that the kingdome should not in proceffe of time bee hereditary and held by succession, but by election onely. This king being thus chosen and inuested,

- A inuested, hath thirtie other gouernours assigned vnto him by the people: neither can any person be condemned to death, vnlesse he be cast by the more part of them, and pluralitie of voices: and thus condemned as he is, yet may he appeale vnto the people. Then are there 70 iudges deputed to sit vpon his cause: and if it happen that they assiole and quit this party condemned: then those 30 who condemned him, are displaced from their state and dignity, with a most bitter and sharpe rebuke, and for euer after, as disgraced persons liue in shame and infamie. As for the king, arraied he is in aparrell as prince *Bacchus* went in old time: but the subiects and common people are clad in the habit of Arabians. If it fortune that the king offend, death is his punishment: howbeit, no man taketh in hand to doe execution. All men turne away their faces from him, and deigne him not a looke nor a word. But to do him to death in the end, they
- B appoint a solemne day of hunting, right pleasant and agreeable vnto Tygres and Elephants, before which beasts they expose their king, and so he is presently by them deuoured. Moreouer, in that Island good husbands they are for their ground, and till the same most diligently. Vines haue they no vse of at all: for all sorts of fruits otherwise they haue abundance. They take also a great pleasure and delight in fishing, and especially in taking of tortoisses: and so great they are found there, that one of their shells will serue to couer an house: and so the inhabitants doe employ them in stead of rouses. They count an hundred yeeres no long life there: that is the ordinary time of their age. Thus much we haue learned and knowne as touching Taprobane. It remaineth now to say somewhat of those foure Satrapies or prouinces, which we did put off vnto this place. Of them therefore as followeth.

C H A P. XXIII.

¶ *Capissene, Carmania.*

- Beyond those nations that confine hard vpon the riuier Indus, as yee turn toward the mountaintaines, yee enter vpon the realme of *Capissene*, wherein sometime stood the citie *Capissa*, which *Cyrus* the king caused to be raised. At this day there standeth the citie *Arachosia*, with a riuier also of that name in the country *Arachosia*: which citie some haue called *Cophe*, founded by queene *Semiramis*. There likewise is to be seen the riuier *Hermandus*, which runneth by *Abeste*, a city of the *Aracosians*. The next that confront *Arachosia* Southward, toward part of the *Arachotes*, are the *Gedrosi*: and on the Northside, the *Paropamisades*. As for the towne
- D *Cartana*, named afterwards *Tetragonius*, scituate it is at the foot of the mountaine *Caucasus*. This country lies ouer-against the *Bactrians*: then you come to the principall towne thereof *Alexandria*, named so of king *Alexander* the founder thereof: vpon the marches whereof are the *Syndrari*, *Dangulæ*, *Porapiani*, *Cantaces*, and *Maci*. Moreouer, vpon the hill *Caucasus* standeth the towne *Cadusi*, built likewise by the said *Alexander*. On this side all these regions lieth the coast of the riuier *Indus*. Then follows the region of the *Arianes*, all scorched and senged with the parching heate of the Sunne, and inuironed about with desarts: howbeit, many shadowie vallies lie between to allay the exceeding heat. Well peopled it is about the two riuers especially, *Tonderos* and *Arasapæ*. Therein stands the citie *Artaccana*. Being past it, the riuier *Arius* runneth vnder the city *Alexandria*, built by *Alexander* the Great. The towne containes in compass 30 stadia. Then come you to *Artacabane*, a citie as it is much more ancient, so it is also fairer by far, which by *Antiochus* the king was walled the second time, and enlarged to 50 stadia. The next in order is the nation of the *Dorisci*. The riuers *Pharnacotis* and *Ophradus*. *Prophtasia*, a towne in *Zaraspria*. The *Drangæ*, *Argetæ*, *Zarangæ*, and *Gedrusij*. Townes moreouer, *Peucolais* and *Lymphora*. After you are past their territory, you enter into the desarts of the *Mithoricanes*, and so to the riuier *Mauain*, and the nation of the *Augutturi*. The riuier *Borru*, the people called *Vrbi*, the nauigable riuier *Ponamus*, which passeth through the marches of the *Pandanes*. Ouer and besides, the riuier *Ceberon* within the country of the *Sorates*, which in the mouth thereof where it falleth into the sea, makes many baies and harbours. As you go farther, you come vpon the towne *Candigramma*, with the riuier *Cophes*: into which there runne other riuers that carry vessels, to wit, *Sadarus*, *Paraspus*, and *Sodinus*. As for the country *Darius*, some would haue it to be a part of *Ariana*, and they set down the measure of them both together to be in length 1250 miles, & in breadth lesse by half than *India*. Others haue set down that the country of the *Gedrusians* and *Seyrians* may contain 183 miles. Being passed which quarters,

quarters, you enter into the region of the Ichthyophagi, surnamed Oritæ or mountainers (who haue a proper language by themselves, and speake not in the Indian tongue) which reaches on full for 200 miles. And beyond it you meet with the people of the Arbians, who likewise continue for other 200 miles. As for those Ichthyophagi before-named, *Alexander* by an expresse edict forbade them all to feed on fish. Being past them, you are in the deserts: and beyond them you come into Carmania, Persis, and Arabia. But before that we treat distinctly of these countries, I thinke it meet to set downe what *Onesicritus* (who hauing the conduct of a fleet vnder *Alexander* the great, sailed from off India, about the Southerly coasts of Persis) reports according to those intelligences which came lately from king *Iuba*. In like maner those voiaiges of ours for these yeeeres past, performed, by which euen at this day we are guided. Howbeit, in the reports made by *Onesicritus* and *Nearchus*, of their nauigations, we finde neither the distance, ne yet the names of the seueral resting places, after euery daies iournie. And to begin with the citie Xyleneopolis built by *Alexander*, from which they entred first into their voiage, it is not put down by them, either in what place it is situate, nor vpon what riuer. Yet these particulars following are by them reported worth remembrance: to wit, that in this voyage *Nearchus* founded a towne in those parts: that the riuer Nabrus runs thereby, and is able to beare great vessels: ouer-against which there is an Island 70 stadia within the sea. Moreouer, that *Leonatus* caused Alexandria to be built in the frontiers of that region, by direction and commandement from king *Alexander*, where the riuer Argenus enters into the sea, and yeelds a safe & commodious haue. Also that the riuer Tiberum is nauigable, along the bankes whereof the Parites inhabit. And after them the Ichthyophagi, who tooke vp so long a tract, that they were 20 daies sailing by their coasts. They make relation likewise of the Isle of the Sun, named also the couch or bed of the nimphs: This Island is red all ouer, and no liuing creature will liue therein, but is consumed, & perishes no man knoweth how, or vpon what cause. They speake besides of the nation of the Oriens: as also of Hytanis a riuer in Carmania, which affordeth many baies and harbours, yea, and plentie of gold in the grauell and sand thereof. And here was the first place wherein they obserued, that they had a sight of the North-pole star. As for the starre *Arcturus*, they affirmed, that they saw it not euery night, nor at any time all night long. Furthermore, that the country of the Achæmenides in Persia, reached thus farre. Ouere and besides, that as they trauelled, ordinarily they found good store of mines, wherein was digged for brasse, yron, Arsenicke or Sardaracha and Vermilion. And then they came to the cape of Carmania: from which to the coast ouer-against them of the Maræ, a people in Arabia, the cut ouer sea is 50 miles. Vpon these coasts they discovered 3 Islands, whereof Organa onely is inhabited, by reason of fresh water within it, and from the continent it lieth about 25 miles. And foure Islands more they fell vpon, euen in the Persian gulf ouer-against Persia. And about these Islands they might see sea-adders & Serpents so monstrous great that as they came swimming toward them, they put the very fleet in great fright, for there were among them some, 20 cubits long. Beyond it they met with the Island Acrotadus: likewise the Gaurates Isles, wherein the nation the Chiani doe inhabit. About the middle of this gulf or arme of the sea, the riuer Hiperus hath his course, able to beare great hulkes and ships of burden. Also the riuer Sitiogagus, vpon which a man may passe in 7 daies to Pasargadia. Also a riuer that is nauigable called Phiristimus, and an Island within it, but it is namelesse. As for the riuer Granus which runs through Susiane, it carries but small vessels. Along the coast on the right hand of this riuer dwell the Deximontanes, who dresse and prepare Bitumen. Then they come to the riuer Oroatus, with a dangerous haue or mouth where it falls into the sea, vnlesse a man be guided by skilfull pilots: & full against this riuer there are discovered 2 little Islands. Past which, the sea is very low and shallow, full of shelues and sands, more like a meere and marsh water, than a sea. Howbeit there be certaine trenches or channells in it that draw deepe water, wherein they may without danger saile. Then met they with the mouth of the riuer Euphrates. Also the lake which the two riuers Eulæus and Tigris doe make, neere vnto Characum. And so from thence they arriued vpon the riuer Tigris, at Sufa. And there an end of the nauigation performed by *Onesicritus* and *Nearchus*. For after they had bene three months embarked and in their voiage vpon the sea, they found *Alexander* at Sufa (where he feasted and made solemne bankets) and that was 7 monthes after he parted from them at Patalæ. And thus much concerning the voiage of *Alexander* his fleet. Now afterwards from Syagrus, a Promontory in Arabia, it was counted vnto Patalæ 1332 miles, & held it was for certain then that,

A that the West wind with the people of that country call Hypalus, was thought most proper for to make saile to the same place. Howbeit the age ensuing discovered a shorter and safer cut, namely, if from the said promontorie or cape Syagrus, they set their course directly to the mouth of the ritter Zigerus, which maketh an harborough in India. And in truth this passage held a long time, vntill such time that in the end the merchants found out a more compendious and shorter course, and gained by their voiage to India: for euery yeeere now they saile thither, and for feare of pirats and rousers that were wont very much to infect and annoy them, they vsed to embarke in their ships certaine companies of Archers. And seeing that all these seas are now discovered, and neuer before so certainly, I will not thinke much of my pains, to declare and shew, the whole course of our Indian voiaiges from out of Egypt. And first and foremost this is a thing worthy to be noted and obserued of euery man, that there is not a yeeere goeth ouer our heads, but it costs our State to furnish a voiage into India, 500 hundred thousand Sesterces, i. fifty millions of Sesterces. For which the Indians sendeth backe againe commodities and merchandise of their owne, which being at Rome, are sold for an hundred times as much as they cost, or yeeld in the price an hundred fold gain. But to returne againe to our voiage, from Alexandria in Egypt, it is two miles to Iuliopolis: from whence vpon the riuer of Nilus, they saile 303 miles to Coptus, which may be done in 12 daies space, hauing the Etesian winds at the poupe. From Coptus they trauell forwards vpon Cammels backs: and for great default of water in those parts, there be certain set places for bait, lodging, and watering.

C The first is called Hydreuma 32 miles from Coptus. The second one daies journey from thence in a certaine mountaine. The third watering place at another Hydreuma, 95 miles from Coptus. The fourth againe in a second mountaine. The fifth is at a third Hydreuma of *Apollo*, from Coptus 184 miles. Beyond which, the resting place is vpon another hill. And then to Hydreuma the new, from Coptus 234 miles. Another water towne there is, called Hydreuma the old, named also Trogloditicum, where two miles out of the port way lieth a garrison, keeping watch and ward both day & night: and foure miles distant it is from new Hydreuma. From whence they trauell to the towne Berenice, an haue towne standing vpon the red sea, 258 miles from Coptus. But for as much as the journey all this way is for the most part performed in the night season, by reason of the excessiue heat, & the traouellers are forced to rest all the day long, therefore twelue daies are set down for the whole voiage between Coptus and Berenice. The time then that they vsually begin to set saile, is about Midsummer before the dog daies, or presently vpon the rising of the dog starre. And about the 30 daies end they arriue to Ocelis in Arabia, or els at Cama, within Saba, the country of incense. A third port there is besides called Muza, vnto which there is no resort of merchants out of India: neither is it in request but with merchants that aduenture only for incense, drugs, & spices of Arabia. Howbeit peopled this country is within-forth, and hath diuers great townes. Of which, Saphar is the principall, and the kings seat: & another besides of good importance called Sabe. But for them that would make a voiage to the Indians, the most commodious place to set forward is Ocelis: for from thence, and with the West wind called Hypalus, they haue a passage of forty daies sailing to the first towne of merchandise in India, called Muziris. Howbeit a port this is, not greatly in request, for the daunger of pirates and rousers, which keep ordinarily about a place called Hydra: and besides that, it is not richly stored and furnished with merchandise. And more than so, the harborough is farre from the town, so as they must charge and dischrg their wares to and fro in little boats. At the time when I wrote this story, the king that reigned there, was named *Celeborthras*. But another haue there is more commodious, belonging to the Necanidians, which they call Becare: the kings name at this present is *Pandion*: not far off is another town of merchandise within the firme land, called Madufa. As for that region, from whence they transport pepper, in small punts or trouges made of one peece of wood, it is named Corona. And yet of all these nations, haueans, and towns, there is not a name found in any of the former writers. By which it appeareth, that there hath been great change and alteration in these places. But to come againe to India, our merchants returne from thence back in the beginning of our month December, which the Egyptians call Tybis, or at farthest before the sixt day of the Egyptians month Machiris, and that is before the Ides of Ianuary: and by this reckoning they may passe to and fro, and make return within the compasse of one yere. Now when they saile from India, they haue the Northeast wind Vulturius with them: and when they be entered once into the red sea, the

So as it appeareth that euery daies journey was about 34 miles.

South or Southwest. Now wil we return to our purposed discourse as touching Carmania. The coast wherof after the reckoning of *Nicarchus* may take in circuit 12050 miles. From the first marches thereof to the riuer Sabis is counted 100 miles. From whence all the way as far as to the riuer Andaius, the country is rich and plenteous, for in it are vineyards and corne fields well husbanded. This whole tract is called Amuzia. The chiefe townes of Carmania be Zetis and Alexandria. Vpon the marches of this realme the sea breaks into the land in two armes, which our countrymen call the red sea, and the Greekes Erythræum, of a king named *Erythras*: or as some thinke, because the sea by reason of the reflection and beating of the Sun beams, seemes of a reddish colour. There be that suppose this rednesse is occasioned of the sand and ground which is red: and others againe, that the very water is of the own nature so coloured.

CHAP. XXIV.

¶ The Persian and Arabian gulfs.

THIS red sea is diuided into two armes: that from the East is named the Persian gulf, being in compasse 2500 miles, by the computation of *Eratosthenes*.ouer against this gulf, in Arabia (which lieth in length 1200 miles) on the other side another arme there is of it called the Arabian gulf, which runs into the Ocean Azanius. The mouth of the Persian gulf where it maketh entrance is 5 miles ouer, and some haue made it but 4: from which to the farthest point thereof, take a direct and straight measure by a line, and for certaine it is, that it containeth 1225 miles: and is fashioned directly like a mans head. *Onesichritus* and *Nearchus* write, That from the riuer Indus to the Persian gulf, and so from thence to Babylon by the meeres and fens of the riuer Euphrates, it is 2500 miles. In an angle of Carmania inhabit the Chelonophagi, i. such as feed vpon the flesh of Tortoises, and the shells of them serue for roofes to couer their cottages. They inhabit all that coast along the riuer Arbis, euen to the very cape: rough they are, hairy all their body ouer but their heads, and weare no garment but fish skins.

CHAP. XXV.

¶ The Island Cassandrus: and the kingdomes vnder the Parthians.

WHEN you are past this tract of the Chelonophagi, directly toward India, there lieth fifty miles within the sea the Island Cassandrus, by report all desert and not inhabited: and neere to it, with a little arme of the sea between, another Island called Stoils; wherein pearles are good chaffer, and yeeld gainfull trafficke. But to returne againe to Carmania, when you are beyond the utmost cape thereof, you enter presently vpon the Armozei, who ioyn vpon the Carmanians. But some say that the Arbij are between both: and that their coast may containe in the whole 402 miles. There are to be seen the port or hauen of the Macedonians, and the altars or columnes which *Alexander* erected vpon the very promontorie and utmost cape. Where also be the riuers Saganos, Daras, and Salfos. Beyond which is the cape Themiscas, and the Isle Aphrodisias well peopled. Then beginneth the realme of Persis, which extendeth to the riuer Oroatus, that diuides it from Elymais. ouer against the coasts of Persis, these Islands be discovered, Philos, Cassandra, and Aratia, with an exceeding high mountaine in it: and this Isle is held consecrated to *Neptune*. The very kingdome of Persis Westward hath the coasts lying out in length 450 miles. The people are rich, and giuen to royall and superfluous expence in all things: and long since are become subiect to the Parthians, carying their name. And seeing we are come to speake of them, we will briefly now mention their dominion and empire: the Parthians haue in all 18 realmes vnder them; for so they termed all their prouinces as they lie diuided about the two seas, as wee haue before said: namely the red sea Southward, and the Hircane sea, toward the North. Of which, eleuen that lie about in the countrey, and are called the higher Prouinces, they take their beginning at the confines and marches of Armenia, and the coasts of the Caspians on the one side: and reach to the Scythians, whom they confront of the other side, with whom they conuerse and keepe company together as Equalls. The other seuen are called the base or lower Realms. As for the Parthians, their land was alwaies counted to ly at the foot and descent of those mountains wherof we haue so often

spoken,

A spoken, which do enuiron and enclose all those nations. It confineth Eastward vpon the Arii, and Southward, vpon Carmania and the Arians: on the West side it butteth vpon the Pratites and Modes: and on the North, boundeth vpon the realm of Hircania: compassed round about with deserts and mountaines. The utmost nations of the Parthians before yee come to those deserts be called Nomades: and their cheife townes seated toward the West, are Istaris and Calliope, wherof we haue written before: but toward the Northeast, Europum; and Southeast Mania. In the heart and midland standeth the citie Hecatompylos, as also Arsacia. And there likewise the noble region of Nysea in Parthyerum: together with the famous city Alexandropolis, bearing the name of *Alexander* the first founder.

CHAP. XXVI.

Media, Mesopotamia, Babylon, and Seleucia.

REQUISIT now it is and needfull in this place to describe the posture and situation of the Medians kingdom, and to discover all those countries round about, as farre as to the Persian sea, to the end that the description of other regions hereafter to be mentioned, may the better be vnderstood. Wherein this first and formost is to be obserued, that the kingdome of Media on the one side or other confronteth both Persis and Parthia, and casting forth a crooked and winding horne as it were toward the West, seemeth to enclose within that compasse both the said realmes. Neuerthelesse, on the East side it confineth vpon the Parthians and Caspians: on the South, Sittacene, Susiane, and Persis: Westward, Adiabene: and Northward, Armenia: as for the Persians, they alwaies confronted the red sea, whereupon it was called the Persian gulf. Howbeit, the maritime coast thereof is called Cyropolis, and that part which confineth vpon Media, Elymais. In this realme there is a strong fort called Megala, in the ascent of a steep high hill, so direct vpright, that a man must mount vp to it by steps and degrees, and otherwise the passage is very streight and narrow. And this way leadeth to Persepolis the head city of the whole kingdome, which *Alexander* the great caused to be rased. Moreouer in the frontiers of this Realme, standeth the city Laodicea, built by king *Antiochus*. From whence as you turn into the East, the strong fort or castle Passagarda is seated, which the sages or wise men of Persia called Magi, do hold, and therein is the tomb of *Cyrus*. Also the citie Ecbatana belonging to these sages, which *Darius* the king caused to be translated to the mountaines. Between the Parthians and the Arians lie out in length the Parotacenes. These nations and the riuer Euphrates serue to limit and bound the seuen lower realmes abouenamed. Now are we to discourse of the parts remainitg behind of Mesopotamia; setting aside one point and corner thereof, as also the nations of Arabia, wherof we spake in the former booke. This Mesopotamia was in times past, belonging wholly to the Assyrians, dispersed into pettie villages and burgades, all saue Babylon & Ninus. The Macedonians were the first, that after it came vnder their hands reduced it into great cities, for the goodnesse and plenty of their soile and territorie. For now besides the abouenamed townes, it hath in it, Seleucia, Laodicea, and Artemita: likewise within the quarters of the Arabians named Aroei & Mardani, Antiochea: and that which being founded by *Nicanor*, gouernor of Mesopotamia, is called Arabis. Vpon these ioine the Arabians, but well within the countrey are the Eldamarij. And about them is the citie Bura, situated vpon the riuer Pellocontas: beyond which are the Salmanes and Mascans Arabians. Then there ioine to the Gordians those who are called Aloni, by whom the riuer Zerbis passeth, and so discharged into Tigris. Neere vnto them are the Azones and Silices mountainers, together with the Orentians: vpon whom confronteth the city Gaugamela on the West side. Moreouer, there is Sue among the rocks: aboue which are the Sylici and Classita, through whom Lycus the riuer runneth out of Armenia. Also, toward the Southeast, Absitris, and the town Azochis. Anon you come down into the plains & champion country, where you meet with these towns, Diospage, Positelia, Stratonicea, & Anthemus. As for the city Niccephorium, as we haue already said, it is seated neer to the riuer Euphrates, where *Alexander* the great caused it to be founded, for the pleasant seat of the place, and the commodity of the countrey there adioining. Of the city Apamia we haue before spoken in the description of Zeugma: from which they that goe Eastward meet with a strong fortified town, in old time carrying a pourprise & compasse of 65 stadia, called the royall pallace of their great dukes & potentates, named Satrapæ,

i. the kings ri-
uer.

vnto which from all quarters men resorted to pay their imposts, customs, and tributes; but now it is come to be but a fort and castle of defence. But there continue still in their entire and as flourishing state as euer, the city Hebrata and Oruros, to which by the fortunat conduct of Pompey the Great, the limits and bounds of the Roman empire were extended; and is from Zeugma 250 miles. Some writers report, that the riuer Euphrates was diuided by a gouernor of Mesopotamia, and one arme thereof brought to Gobaris, euen in that place where we said it parted in twain: which was done for feare lest one day or other the riuer with his violent streame should indanger the city of Babylon. They affirme also, that the Assyrians generally called it * Armalchar, which signifieth a royall riuer. Vpon this new arme of the riuer aforesaid, stood sometime Agrani, one of the greatest towns of that region, which the Persians caused to be utterly rased and destroyed.

As for the city of Babylon, the chiefe city of all the Chaldean nations, for a long time carried a great name ouer all the world: in regard whereof all the other parts of Mesopotamia and Assyria was named Babylonia: it contained within the walls 60 miles: the walls were 200 foot high, and 50 thick, reckoning to euery foot 3 fingers bredth more than our ordinary measure. Through the midst of this goodly great city passeth the riuer Euphrates: a wonderfull piece of worke, if a man consider both the one and the other. As yet to this day the temple of Jupiter Belus there stands entire. This prince was the first inuenter of Astronomie. It is now decayed, and lieth waste and vnpeopled, for that the city Seleucia stands so neere it, which hath drawne from it all resort and traffique; and was to that end built by Nicator within 40 miles of it, in the very confluent where the new arm of Euphrates is brought by a ditch to meet with Tigris: notwithstanding it is named Babylonia, a free state at this day, and subiect to no man; howbeit they liue after the lawes and manners of the Macedonians. And by report, in this city there are 600000 citifens. As for the walls thereof, it is said they resemble an Eagle spreading her wings: and for the soile, there is not a territorie in all the East parts comparable to it in fertilitie. The Parthians in despiht again of this city, and to do the like by it, as sometime was done to old Babylon, built the city Ctesiphon within three miles of it, in the tract called Chalontis, euen to dispeople and impoverish it; which is now the head city of that kingdom. But when they could do little or no good thereby to discredit the said new Babylon, of late dayes Vologesus their king founded another city hard by called Vologeso Certa. Moreouer, other cities there are besides in Mesopotamia, namely Hipparenum, a city likewise of the Chaldeans, and innobled for their learning as well as Babylon; scituate vpon the riuer Narragon, which gaue the name vnto that city. Howbeit the Persians caused this Hipparenum to be dismantled, and the walls thereof to be demolished. There be also in this tract the Orchenes towards the South, from whence is come a third sort of the Chaldeans, called Orcheni. Being past this region, you meet with the Norites, Orthophants, and Græciophants. *Nearchus* and *Onesicritus*, who registred the voiage of Alexander the Great into India, report, That from the Persian sea to the city Babylon by the riuer Euphrates, is 412 miles. But the later and moderne Writers do count from Seleucia to the Persian gulfe 490 miles. *K. Tubaw* titeth, That from Babylon to Charax is 175 miles. Some affirme moreouer, That beyond Babylon the riuer Euphrates doth maintaine one entire course, and keepeth one channel 87 miles, before he is diuided into feuerall branches here and there, for to water the country: and that he holdeth on his course from his head to the sea for the space of 1200 miles. This varietie of Authors as touching the measure is the cause why a man may not so wel resolute and conclude thereof, considering that euen the very Persians agree not about the dimensions of their Scenes and Parafanges, but haue diuers measures of them. Whereas the riuer Euphrates giueth ouer his owne chanel, (which for the bredth thereof is a sufficient munition to it selfe) and beginneth to part into diuers branches, which it doth about the marches & confines of Charax, in all the tract neere adioyning, great danger there is of the Attalæ, a theeuish nation amongst the Arabians, who presently set vpon all passengers comming and going to and fro. When you are past this infamous and suspected Region, you shall enter into the Countrey of the Schenites. As for the Arabians which are called Nomades, they occupie all the coasts of the riuer Euphrates, as farre as to the Desarts of Syria. From the which place we haue said that hee turned, and tooke his way into the South, abandoning the desarts of Palmyrene. To conclude, from the beginning and head of Mesopotamia, it is counted to Seleucia, if you passe vpon the riuer Euphrates, 1125 miles:

A miles: and from the red sea, if you go by the riuer Tigris, 320 miles: from Zeugma 527 miles: and to Zeugma from Seleucia in Syria vpon the coast of our sea, is reckoned 175 miles. This is the very true and iust latitude there, of the firm land between the two seas, to wit, the Persian gulfe and the Syrian sea. As for the kingdome of Parthia, it may containe 944 miles. Finally, there is yet another towne of Mesopotamia vpon the banke of Tigris, neere the place where the riuers meet in one, called Digba.

CHAP. XXVII.

¶ The riuer Tigris.

B Me et also and conuenient it is to say somewhat of the riuer Tigris. It begins in the land of Armenia the greater, issuing out of a great source; and euident to be seen in the very plaine. The place beareth the name of Elongosine. The riuer it selfe so long as it runs flow and softly is named Diglito; but when it begins once to carry a more forcible streame it is called Tigris, for the swiftnesse thereof; which in the Medians language betokens a shaft. It runs vp into the lake Arethusa, which beareth vp afloate all that is cast into it, suffering nothing to sinke; and the vapors that arise out of it carry the sent of Nitre. In this lake there is but one kind of fish, and that entreth not into the chanell of Tigris as it passeth through, nor more than any fishes swim out of Tigris into the water of the lake. In his course and colour both he is vnlike, and as he goes may be discerned from the other: and being once past the lake, and in countreth the great mountain Taurus, he loseth himself in a certain caue or hole in the ground, and so runs vnder the hill, vntill on the other side thereof he breaketh forth again, and appears in his likenesse, in a place called Zoroanda. That it is the same riuer it is euident by this, that he carrieth through with him, and sheweth in Zoroanda, whatsoeuer was cast into him before he hid himselfe in the caue aforesaid. After this second spring and rising of his he enters into another lake, and runneth through it likewise, named Thospites; and once again takes his way vnder the earth through certain blinde gutters, and 25 miles beyond he putteth forth his head about Nymphæum. *Claudius Cesar* reporteth, that in the countrey Arrhene, the riuer Tigris runs so neere the riuer Arsanias, that when they both swell, and their waters are out, they ioine both their streams together, yet so, as the water is not mingled: for Arsanias being the lighter of the twain, swimmeth and floteth ouer the other for the space wel-neere of 4 miles: but soon after they part asunder, and Arsanias turneth his course toward the riuer Euphrates, into which he entreth. But Tigris receiuing into him certain goodly great riuers out of Armenia, to wit, Parthenis, Agnice, and Pharion, & so diuiding the Arabians & Trocenes from the Adiabenes, and by this means making as it were an Island of Mesopotamia aforesaid, after he hath passed by and viewed the mountaines of the Gordians, neere vnto Apamia a towne of Mesene on this side Seleucia surnamed Babylonia, 125 miles: diuiding himselfe into two armes or channels, with the one he runneth Southward to Seleucia, watering as he goeth the countrey of Mesene; and with the other windeth Northward: he goeth on the backside of the said Mesene, and cutteth through the plains of the Cauchians. Now when these two branches are re-vnited again, the whole is called Pasitigris. After this, he taketh into him out of Media, the great riuer Caspes: and so passing between Seleucia and Ctesiphon, as we haue said, he falls into the meeres and lakes of Chaldæa, which he furnissheth and replenissheth with water for the compasse of seuentie miles: which done, he issueth forth againe, gushing out with a mighty great and large streame; and running along the towne Charax, on the right hand thereof, he dischargeth himselfe into the Persian sea, carrying there a mouth ten miles ouer. Between the mouthes of these two riuers, Tigris & Euphrates, where they fall into the sea, were counted in old time 25 miles, or as some would haue it but seven: and yet both of them were nauigable, and bare right great ships. But the Orcheniens and other neighbor inhabitants, long since turned the course of Euphrates aside to serue their owne turnes in watering their fields, and stopped the ordinarie passages thereof, insomuch as they forced him to run into Tigris, & not otherwise than in his chanell to fall into the sea. The next countrey bordering vpon Tigris is called Parapotamia, in the marches whereof is the city Mesene, whereof we haue spoken. The chiefe towne thereof is Dibitach: from thence you enter presently into the region Chalontis, ioyning hard vpon Ctesiphon, a rich countrey, beautified not only with rowes of date trees, but also with Oliue, Apple,

and pearre trees, and generally with all sorts of fruit. Vnto this country extends the mountaine Zagrus, comming along from out of Armenia, between the Medes and Adiabenes, aboue Parretacene and the realme of Persis. Chalontis is from Persis 480 miles distant: & some write, that going the streight, direct, and neere way, it is so much and no more from the Caspian sea to Assyria. Between these countries and Mesene lieth Sittacene, the same that Arbelitis and Palestine. The townes of importance therein are Sittace, held by the Grecians, scituate toward the East, and Sabata: but on the West side Antiochia, seated betwene the two riuers Tigris and Tornadotus. In like manner Apamia, which *Antiochus* the king so called after his mothers name, This City is inuironed as it were with the riuier Tigris, and diuided with the riuier Archous which passeth through it. Somewhat lower than these countries lieth the region Susian, wherein stood the antient royall pallace and seat towne of the Persian kings, Susa, founded by *Darius* son of *Hystaspes*; and from Seleucia Babylonia it is 450 miles distant: & as much from Ecbatana in Media, taking the way along the mountaine Charbanus. Vpon that branch of the riuier Tigris that taketh his course Northward, stands the towne Babyrace; and from Susa it is 135 miles. The people of this country are the only men in the world that hate gold: and in very truth get it they do, and when they haue it, they bury it sure enough within the ground, that it may serue for no vse. Vpon the Susianes Eastward ioyn the Cossians, Brigands, and theenes generally all. Likewise the Mizrans, a free state, and subiect to no gouernment, hauing vnder them 40 nations, all wilde, and liuing as they list. Aboue these quarters you enter into the countries of the Parthians, Mardians, Saïtes, and Hyans, who confine vpon high Persia called Elemais, which ioineeth to the maritime coasts of Persis, as is aboue said. The city of Susa is from the Persian sea 250 miles. On that side whereas the Armada of *Alexander* the Great came vp the great riuier Palitigris to Susa, there stands a Village on the lake Chaldais, name Aphe, from which to Susa is 65 miles and an halfe by water. The next that border vpon the Susians Eastward are the Cossians: and aboue the Cosses Northward lieth Mesobaten vnder the hill Cambalidus, which is a branch and dependant of the mountain Caucasus; and from thence is the most easie and ready passage into the country Bactriana. The riuier Eulæus makes a partition betwixt the high country of Persis called Elemais, and Susiane. This riuier issueth out of the Medians country, & in the midst of his course loseth himself vnder the ground: but being once vp againe he runneth through Mesobaten, and inuironeth the fort & castle of Susa, with the Temple of *Diana*, which is had in great reuerence and honour aboue all other Temples in those parts: yea, and the very riuier it selfe is in much request, and the water thereof ceremoniously regarded, in such wise, as the kings drinke of no other, and therefore they fetch it a great way into the country. And it receiueh into it the riuier Hedypnus, which commeth along the Priuiledged place whereinto the Persians vse to retyre for sanctuarie, and one more out of the Susianes country. A towne there is planted neere vnto it, called Magoa, 15 miles from Charax: yet some there be that would haue this towne to stand in the vtmost marches of Susiana, euen close to the mountaines and desarts. Bencath the riuier Eulæus lieth Elemais, ioyning to Persis in the very maritime coast; 240 miles it is from the riuier Oroates to Charax: the towns in it be Seleucia and Sofrate, both scituate vpon the hanging of the hill Casyrus. The flat coast and leuell thereof, which lieth before it, is, as we haue said before, no lesse dangerous, and vnaccessible than the Syrts, for quauemires, by reason of the great store of mud and sand together, which the riuers Brixia and Ortacea bring downe with them.ouer and besides, the country Elemais is so fenny, and standeth with water so wet, that there is no way through it to Persis, but a man must fetch a great circuit and compasse about it to come thereto. Moreouer, it is much haunted and annoied with serpents, which breed and come downe in those riuers: And as troublesome as the passage is all the country ouer, yet that part yeeldeth the worst aduenues, and is least frequented, which is called Characene, of the towne Charax, which limits the kingdomes of Arabia, whereof we will speake anon more at large, after wee haue set downe the opinion of *M. Agrippa*, which he hath deliuered as touching these quarters: for he hath written, that Media, Parthia, and Persis are bounded on the East side with the riuier Indus; on the West with Tigris; on the North part with the two mountaines, Taurus and Caucasus; and on the South coast with the red sea: also that they extend in length 1320 miles, and in bredth eigh hundred forty. Moreouer, that Mesopotamia by it selfe alone is inclosed Eastward with the Riuier Tigris, and Westward with Euphrates; hauing on the North side the mountaine

Taurus.

- A Taurus, and on the South the Persian sea: lying out in length 800 miles, and in bredth 360: now to returne vnto Charax, the inmost towne within the Persian gulfe, from which Arabia called Eudemonia, happie, begins and runneth forth in length; scituate it is vpon a mount artificially reared by mans hands between the confluent of Tygris on the right hand, and Eulæus on the left, and yet notwithstanding it carrieth a pourprile or precinct of three miles compasse. Founded first it was by *Alexander* the great, who hauing drawne Coloners to inhabite it out of the kings city Durine (which then was ruinat) and leauing there behind him those soldiers which were not fit for seruice, nor able to follow in the march, ordained, that this towne should be called Alexandria: and the territory about it Pellæum, of the towne where himselfe was born: and withall appointed, that it should be peopled only with Macedonians. But this towne of his by him founded, was ouerthrowne and destroyed by the two riuers aforesaid. Afterwards *K. Antiochus* the first rebuilt it again, and named it of himselfe Antiochia. But when it was decayed a second time by these riuers, *Spasines*, son of *Sogdonacus*, who held Arabia, bordering neere by as an absolute king, and not (as *Iuba* reporteth) as a duke or gouernor vnder *Alexander*, raised great wharfes, and opposed mightie dams and caufies against those riuers, and so re-edified the towne a third time. Which done, he called it after his own name Charax of Spasines: and verily hee fortified thus the site and foundation thereof, three miles in length, and little lesse in breadth. At the beginning it stood vpon the sea-coast, and from the water side not aboue ten stadia, and euen from thence it hath certain false ballard galleries: but by the report of *Iuba* in his time, 50 miles. Howbeit, at this day both the Arabian Embassadors, and also our merchants that come from thence, say it is from the sea shore 125 miles. In such sort, that it cannot be found in any place of the world again, where the earth hath gained more, nor in so short a time, of the water, by reason of the store of mud brought down with riuers. And the more maruell it is, that considering the sea floweth, and the tide riseth far beyond this towne, yet those made grounds are not beaten back, and carried away againe. In this very towne I am not ignorant that *Dionysius* the latest of our moderne Geographers was born, whom *Augustus* the Emperor sent of purpose beforehand into the East countries to discover those parts, and record faithfully in writing whatsoever he there found, for the better aduertisement of his elder son, who was vpon his voyage and expedition of Armenia, to war against the Parthians and Arabians. Neither haue I forgotten, that in my first entrance into this worke in hand, I made some protestation to follow those who had written of their owne countries, as men lightly most diligent and of best intelligences in that behalfe. Howbeit, in this place I chuse rather to follow our martiall captaines that haue warred there, and report me also to *K. Iuba*, who hath written certain books to *C. Caesar* *Caligula*, as touching the occurrences in the Arabian voiage.

CHAP. XXVIII.

¶ Arabia, Nomades, Nabatei, and Omani: Tylos and Ogyris two Islands.

- A Arabia commeth behind no country in the world, for largenesse and greatnesse, especially reaching out in length a mighty way. For it beginneth at the fall and descent of the mountaine Amanus ouer-against Cilicia and Comagene, as we haue before said: where it is peopled with many nations brought from thence thither by *Tigranes* the great, to inhabite that quarter, and in old time descended naturally, and reached as far as to our sea & the Egyptian coast, as we haue shewed; yea, and extendeth into the midland parts of Syria to the mountain Libanus, where the hills reach vp to the very clouds: vpon which bound the Ramisians, then the Taraneans, and after them the Patami. As for Arabia it selfe, being like a demie Island, runneth out between two seas, the red and the Persian, by a certain artificiall workmanship of nature, framed according to Italy in likenesse of forme and bignesse: yea, and lieth along the sea coasts in manner of Italy. And more than that, it regardeth the same quarter and line of heauen, without any difference at all. This tract thereof, for the rich seat it hath, is named *Felix*, i. Happy. The nations therein dwelling, from our sea-coasts to the desarts of Palmyrcum, wee haue treated of already. Therefore ouerpassing them, we will discouise of the rest forward. Now then, the Nomades & those robbers that so lie vpon the Chaldaeans & trouble them, the people called Scenitæ, as we haue before said, do confine vpon. And euen they also make no certain place of abode and habitation, but are called Scenitæ, of their tabernacles and booths which they

resort of merchants. Moreover, the Hemnates and Analites, whose townes are Domada and E-
 rage: also the Thamusiens, with their towne Badanatha: the Carreans, and their towne Charia-
 ri: the Achoali, and a city of theirs Phoda. Furthermore, the Minæi, descended as some thinke
 from *Minos* king of Crete: whose citie Charnæi hath 14 miles in compasse. Other townes like-
 wise be there standing a far off, and namely, Mariaba, Baramalacum, a town ywis of no mean ac-
 count: likewise Carnon, and Ramei, who are thought to come from *Rhadamanthus* the brother
 of *Minos*. Ouer and besides, the Homerites, with their towne Massala: the Hamirei, Gedrani-
 tæ, Anapra, Ilisanitæ, Bochilitæ, Sammei, and Amatheï, with these townes Nessa and Cennef-
 feri. The Zamanenes, with these townes, Saiaæ, Scantate, and Bacasmani: the towne Rhiphear-
 ma, which in the Arabian tongue signifieth Barley: also the Antei, Rapi, Gyrei, and Marhatai.
 The Helmadenes, with the towne Ebode. The Agarturi in the mountaines, hauing a towne 20
 miles about, wherein is a fountaine called Emitchabales, that is as much to say, as The Cam-
 elstown. Ampelone, a colony of the Milesians: the towne Atrida: and the people Calingij,
 whose towne is named Mariaba, as much to say as, Lords of all. Towns moreover, Pallon & Mu-
 rannimal, neere vnto a riuer, by which men thinke that Euphrates springeth and breaketh forth
 aboue ground. Other nations besides, namely, Agrei and Ammonij: with a towne, Athenæ: and
 the Caurarani, which signifieth, Most rich in droues of cattell. Then the Caranites, Cæfanes,
 and Choanes. There were sometime also certaine townes in Arabia, held by Greeks, and name-
 ly, Arethusa, Larissa, and Chalcis, which all in the end came to ruine and were destroyed in di-
 uers and sundry wars. The onely man among the Romans vntill this day that warred in those
 parts, was *Abius Gallus* a knight of Rome. As for *Caius Caesar* the son of *Augustus* the Emperor,
 he did but looke only into Arabia, and no more: but *Gallus* wasted townes that were not once
 named by Authors that wrote before, namely Egra, Anestum, Essâ, Magusum, Tamuracum,
 Laberia, and the aboue-named Marieba, which was in circuit six miles about: likewise Cari-
 petæ, the farthest that he went vnto. As for all other matters, he made report vnto the Senate of
 Rome, according as he had found and discovered in those parts; to wit, that the Nomades liue
 of milke and venison: the rest of the Arabians presse wine, like as the Indians do, out of dates:
 and oile of Sefama, a kinde of graine or pulse in those countries. That the Homerites country
 of all others is most populous and replenished with people: the Minæans haue plenteous and
 fruitfull fields, full of date trees and goodly hortyards stored with all sorts of fruit: but their
 principall riches lieth in cattell. The Cembanes and Arians are good warriors and martiall
 men, but the Chatramotites that way excell all the rest. The Carreans haue the largest territo-
 ries and most fertile fields for come. As for the Sabæans, their wealth standeth most vpon their
 woods and trees, that bring forth the sweet gums of Frankincense and myrrhe: also in mines of
 gold: hauing water at commandement to refresh their lands, and plenty besides of hony & wax.
 As concerning the sweet odours and spices that come from thence, we will speake thereof in a
 seuerall booke by it selfe. The Arabians weare miters or turbants ordinarily vpon their heads,
 or else go with their haire long and neuer cut it: as for their beards, them they shauē, saue only
 on their vpper lippe, which they let grow still: and yet some of them there be that suffer their
 beards to grow long and neuer cut them. But this one thing I maruell much at, that being such
 an infinit number of nations as they be, the one halfe of them liue by robberie and theeuing,
 howsoeuer the other liue by traffick and merchandise. Take them generally, they be exceeding
 rich; for with them the Romans and Parthians leaue exceeding sums of gold and siluer, for the
 commodities out of their woods and seas which they sell vnto them: but they themselues buy
 nothing of them againe. Now will we speake of the other coast opposite vnto Arabia. *Timosthe-
 nes* hath set downe, that the whole gulf or arm of the sea called Red, was from one end to the
 other foure daies sailing: and from side to side, two daies: that the streights of the firthe were
 seuen miles ouer. But *Eratothe-
 nes* saith, that taking the measure at the very mouth, it is euerie
 way 1300 miles.

CHAP. XXIX.

¶ The gulf of the Red Sea: likewise of the Trogloditick and Æthiopian Seas.

A *Rtemidorus* auoucheth, that the Red Sea toward Arabia side, is 1450 miles: but on the
 coast of the Troglodites 1182, vntill you come to the citie Ptolemais. Most Geogra-
 phers haue set downe the breadth thereof to bee 462 miles: and that the mouth of it,
 where

A where it openeth wide, full against sun-rising in winter [i. South-west] some say, is 7 miles broad,
 and others 12. As for the posture situation thereof, thus it lyeth: beyond the branch or arme
 thereof called Ælaniticus, there is another creeke which the Arabians call Æant, vpon which
 standeth the towne Heroon. In old time there was a city called Cambisî, betweene the Nelians
 and Marchandians, into which the sicke and feeble souldiers of our armie were conuied, as to
 a place of retreat and repose. Beyond which, you enter into the land of Tyra: and there is the
 port Dancon to be seene, from which *Sesostri* a king of Ægypt, was the first that imagined and
 deuised to draw one arme of it with a channell nauigable, into Nilus, in that part where it run-
 neth to the place called Delta, and that for 62 miles space, which is between the said riuer and
 the red sea. This enterprise of his was followed by *Darius* king of the Persians: yea and by *Pto-
 lomeus* king of Ægypt, second of that name, who made a channell 100 foot ouer, and 30 deep, for
 37 miles in length and an halfe, euen to the bitter fountaines. But this desigae was interrup-
 ted and the ditch went no farther, for feare of a generall deluge and inundation: for found it
 was, that the red sea lay aboue the land of Ægypt three cubits. Some alledge not that to be the
 cause, but this, namely, That if the sea were let into Nilus, the sweet water thereof (whereof they
 drinke only and of none else) should be corrupted thereby and marred. Yet neuerthelesse, al-
 though this worke went not forward, the way is well beaten all the country ouer betweene the
 Red sea, and the Ægyptian, for trafficke: and three seuerall ordinarie waies there are between:
 the one from Pelusium ouer the sands, where, vnles there be reeds set vp pitched in the ground
 to giue guidance and direction, there would no path be found, for euer & anon the wind blow-
 eth the sand ouer the tracts of mens feet and couereth all. A second beginneth 2 miles beyond
 the mountaine Casius, which after 60 miles commeth into the former Pelusiacke way. (Vpon
 this great rode way, the Arabians called Autei, do inhabit.) The third taketh his head and be-
 ginning at Gereum, which they call Adipson, and holdeth on through the said Arabians, & is
 60 miles neerer way, but full of craggie hills and altogether without waters. All these foresaid
 waies lead to the city Arsinoe, built vpon the gulf Charandra by *Ptolomeus Philadelphus*, and
 bare his sisters name: and verily hee was the first that discovered those parts, and searched nar-
 rowly into the region Trogloditicum: and the riuer that passeth by Arsinoe, he called *Pto-
 lomeus*. Within a litle of this place, there is a litle town named Ennum, for which, some there
 be that write, Philotera. Beyond them, are the Azarei: Arabians of the wilder sort & halfe Tro-
 glodites, by reason they marry their wiues from out of the Troglodites country. Beeing past
 these coasts, you shall finde the Islands Sapyrene and Scytala: and within a litle thereof, de-
 parts vntil you come to Myos-hormos, where there is a fountaine called Taduos, the mount
 Eos, the Island Lambe, many hauens besides, and Berenice a town, bearing the name of the mo-
 ther to *K. Ptolomeus Philadelphus*, to which there is a way lying from Coptos, as we haue said: &
 last of all the Arabians called Autei, and Gnebadei. Now it remaineth to speake of the region
 Trogloditicum, which the antient men of old time called Michoe, & others Midoe: & therein
 standeth the mountaine Pentedaetylos. Vpon the coast of this country, there lie to be seen cer-
 taine Islands called Stenæ-deiræ: and others no fewer in number named Halonnefi: also Car-
 damine, and Topazos, which Island gaue the name to the precious stone called the Topaze.
E Then come you to an arme of the sea betweene two lands, full of pettie Islands, whereof that
 which is called Mareu, is well serued with water sufficient: another, Eratonos, is altogether dry
 and vnprouided of fresh water. These Islands tooke name of two captains and gouernors there
 vnder the king. Within-forth farther into the firm land, inhabit the Candei, whom they call
 Ophiophagi, because they are wont to feed on serpents: and in truth there is not another coun-
 try that breeds them more than it. *K. Iubaw* ho seemeth to haue taken great paines in the dili-
 gent perusing and discovery of these parts, omitted in all this tract (vnlesse there be some fault
 and defect in them that copied out his first originall) to speake of a second city named Bere-
 nice, with the addition of Panchryfos; as also of a third called Epidires, and yet renowned it is
 in regard of the place wherupon it is seated: for scituat it is vpon a knap of land bearing far into
 the red sea, euen where the mouth of it is not about 4 miles & an halfe, from Arabia. Within
F the prospect of this tract there is the Island Cytis, which also bringeth forth good store of the
 Topaze stones. Beyond this quarter, nothing but woods and Forrests, where *K. Ptolomeus* surna-
 med *Philadelphus* built the city Ptolemais, onely for to chafe and hunt the Elephant, neere to
 the lake Monoleus; and in regard of his game there, he named it Epi-theras. This is the verie
 country

country mentioned by me in the second book: wherein for 45 daies before Mid-summer, or the entrance of the Sun into Cancer, and as many after, by the fixt houre of the day, that is to say, about noone, no shadowes are to be seen: which being once past, all the day after they fall into the South. As for other daies of the yere besides, they shew into the North: whereas in that citie Berenice which we mentioned first, vpon the very day only of the Sun-kead, at the sixth houre or noon-tide, the shadowes are cleane gone and none to be seene (for otherwise there is no alteration at all to be obserued throughout the yere) for the space of 600 miles all about Ptolemais. A strange & notable thing worth obseruation, that it should be so but in one houre all the yere long, and a matter that gaue great light and direction to the world, yea and ministered occasion to a singular inuention and subtil conclusion: for *Eratosthenes* vpon this vndoubted argument and demonstration of the diuersitie of shadowes, set in hand hereupon to take the measure of the whole globe of the earth, and put it downe in writing to all posteritie. Beyond this city Ptolemais, the sea changerh his name and is called Azanium; ouer which the cape sheweth it selfe, which some haue written by the name of Hispalus: also, anon appeareth the lake Mandalum, and in it the Island Colocastis; but in the deep sea many more, wherein are taken many tortoises. Farther vpon this coast is the towne Suchæ, and then you may discover in the sea the Island Daphnis, and the city Aduliton, built by certaine Egyptian slaues who ran away from their masters and took no leaue: and verily this is the greatest and most frequented mart towne of all the Troglodites country, and put the Egyptians to them: and it is from Ptolemais 5 daies sailing. Thither is brought great store of yuorie, or the Elephants tooth, and of the horn of the Rhinoceros: there many a man haue plenty of the sea-horse hides, of tortoise shels, of little Monkeys or Marmosets: there also a man may be sped with bondslaues. A little beyond are the Ethiopians, called Aroreræ: also the Islands named Aliaæ: and besides them other Islands, namely, Bacchias, Antibacchias, and Stratonis: being past them, there is a gulf in the coast of Ethiopia, as yet not discovered or knowne by any name: a thing that may make vs maruel much, considering that our merchants search into farther corners than so. Also a promontory, wherein there is a fountaine of fresh water named Curios, much desired of the sailers that passe that way, and in great respect for the refreshing that it yeeldeth vnto them: beyond it, is the harbor or port of Ius, distant from the towne of the Adulites aboue said, ten days rowing with ores; and thither is the Troglodites myrrhe brought, and there laid vp. Before this haven, there lie in the sea two Islands, named Pseudopylæ: and as many farther within, called Pyliæ: in the one of them be certaine pillars of stones, ingrauen with strange and vnkowne Letters. When you are past this haven, you come to an arme of the sea called Abalites: within it is the Island Diodori, and other lying desart and vnpeopled. Also along the continent, there is much wildernesse: but being past them, you come to the towne Gaza: the promontorie also & port Mossylites, vnto which store of cynamon and canell is brought. Thus far marched *K. Sesostris* with his army. Some writers make mention of one town more in Ethiopia beyond all this, vpon the sea side, called Baradaza. *K. Iuba* would haue the Atlantick sea to begin at the promontorie or cape aboue named, Mossylites: on which sea (as he saith) a man may faile very well with a West-north-west winde, by the coasts of his kingdomes of Mauritania or Maroccho, as farre as to the coasts of Gibraltar called Gades: and sure he speaketh so confidently thereof, as I will not altogether discred it his resolution in this behalfe. From a promontorie of the Indians called Lepteacra, and by others Drepanum, vnto the Isle of Malchu, hee saith plainly, that by a straight and direct course it is 15 hundred miles, and neuer reckon those parts that are burnt with the Sun. From thence to a place called Sceneos, he affirmeth it is 225 miles: and from it to the Island Sadanum, 150 miles; and thus by this means he concludeth, that in all, to the open and knowne sea, it is 1885 miles. But all other writers besides him were of opinion, that there could not possibly be any sailing vpon it, for the exceeding heat of the Sun. Ouer and besides, the Arabians named Afcitæ, doe much harme and annoyance from out of the Islands which they hold, vnto merchants that trafficke that way: for these Arabians, according as their name doth import, couple bottles made of good ox leather, two by two together, and going vpon them with ease as it were a bridge vnder them, scoure the seas, and shooting their empoysoned arrowes, practise pyracie, to the great losse and mischief of merchants & sailers. The same *Iuba* writeth moreover, that there be certaine people of the Troglodites, named Therothoes, for their hunting of wilde beasts, of their exceeding and wonderful swiftnesse in chasing of Deere

vpon

A vpon land: as the Ichthyophagi for coursing of fish in the sea, swimming as naturally as if they were water creatures. Moreover, he nameth other nations in those parts, as the Bargeni, Zageres, Chalybes, Saxinæ, Syreces, Daremes and Domazanes. Furthermore, he affirmeth, that the people inhabiting along the sides of Nilus from Syene vnto Meroe, are not Ethiopians, but Arabians, who for to seeke fresh water, approached Nilus; and there dwelt: as also that the citie of the Sunne, which we said before in the description of Egypt, standeth not farre from Memphis, was first founded and built by the Arabians. Contrariwise, other Geographers there be, who affirme that the farther side or banke of Nilus is no part of Ethiopia, and they lay it as a dependant annexed to Affrick. But be it as will be, I wil not greatly busie my head thereabout, but suffer euery man to abound in his own fence, and haue his own way: only I will content my selfe with this, to set downe the townes on both sides thereof, in that order as they are declared vnto me. And first to begin with that side toward Arabia: after you are past Syene, enter you shall vpon the countrie of the Catadupi, and so forward into the land of the Syenites. Wherin these towns stand in order as followes: Tacompson, which some haue called Thatie, Aranium, Sefanium, Sandura, Nasandum, Anadoma, Cumara, Beda and Bochiana, Leuphithorga, Tantaraene, Machindira, Noa, Gophoa, Gystatæ, Megeda, Lea, Rhemnina, Nupfia, Direa, Patara, Bagada, Dumana, Rhadata, wherein a golden car is worshipped as a god. Boron in the midland part of the continent, and Mallos, the next towne to Meroe. Thus hath *Bion* digested and set them downe. But king *Iuba* hath raunged them otherwise in this manner. First, Megarichos a towne situate vpon a hill betweene Egypt and Ethiopia, which the Arabians vse to call Myrson: next to it Tacompson: then Aranium, Sefanium, Pide, Mamuda, and Corambis; nere vnto it a fountaine of liquid Bitumen: Hammodara, Prodda, Parenta, Mama, Thessara, Gallæ, Zoron, Graucome, Emeum, Pidiboræ, Hebdometacometæ, and the Nomades, who ordinarily are encamped vnder tents and paulions. Cyste, Pemma, Gadagale, Paloio, Primmis, Nupfis, Dafelis, Paris, Gambrenes, Magases, Segasmala, Cranda, Denna, Cadeuma, Thema, Batha, Alana, Macum, Scammos, and Gora within an Island. Beyond which, Abala, Androcanis, Seres, Mallos & Agoce. And thus much on the side of Arabia. Now for Affrick side, they are in this wise reckoned. First, Tacomplos, according to the others name, or a parcell rather of the former: then, Magora, Sea, Edofa, Pelenaria, Pyndis, Magufa, Bauma, Linitima, Spyntuma, Sydopra, Genfoa, Pindicitoræ, Eugo, Orfima, Suasa, Maunia, Rhuma, Vrbubuma, Mulona, which town the Greeks were wont to call, Hypaton, Pagoargas, Zanones, & there begin the Elephants to come in, Mambliæ, Berrefa, Cetuma. There was moreover a towne sometime named Epis, situate against Meroe: but rased it was and vtterly destroyed before that *Bion* wrote his Geography. See what cities and towns of name were recorded in times past to haue bin in those parts, vntil you come to the Isle Meroe. And yet at this day there is neither stick nor stone to be found of any of them in a manner on neither side. Only desarts and a vast wildernesse in stead of them, by report made vnto *Nero* the Emperor by the Prætorian souldiers, sent thither from him vnder the leading of a Tribune or Colonel, to discover those quarters of Ethiopia, & to relate accordingly: at what time as among other his designs, that Prince intended an expedition with his army against the Ethiopians. And yet before his time, euen in the daies of *Augustus Cæsar* of happie memory, the Romanes pierced thither with a power of armed men vnder the conduct of *Pub. Petronius*, a knight of Rome, and gouernour of Egypt, deputed by the said Emperour. Where he forced by assault and conquered all those townes in Ethiopia which he then found standing in this order following: namely, Pselcis, Primis, Abaccis, Plithuris, Cambusis, Attena, Stadiis, where the riuer Nilus runs down with such a mighty fall, that with the noife thereof the inhabitants there by lose their hearing and become deafe. Besides these he won also and sacked Napata. And albeit he marched forward still a great way into the countrie, euen 870 miles beyond Syene, yet this Romane armie of his laid not all waite in those parts, & left the country so desart as now it is. No, no: It was the Egyptians warres and not the Romanes that gaue the waite to Ethiopia: and albeit sometimes it woon and otherwhiles lost, one time bare the scepter and ruled, another time vnderwent the yoke, and were subdued: yet was it of great name in the world and puissant, vntill the reigne of king *Memnon*, who ruled at the time of the Troiane war: yea, and Syria was subject vnto it, as also the coast of our sea in king *Cephus* daies, as appeareth by the fabulous tales that go as touching *Andromeda*. Semblably the Geographers varie and disagree much about the measure and dimension of Ethiopia. And first of all others, *Dalio*, albeit

Q

be it

beit he passed far beyond Meroe: after him, *Aristocreon*, *Bion*, and *Basilis*. As for *Simonides* (the younger and the later writer) had sojourned the Meroe five yeares, when he wrote of *Ethiopia*. For *Timosthenes* the Admirall of *Ptolomæus Philadelphus* his naue, hath left in record, that from Syene to Meroe is 60 daies iourney, without any further particularizing of the measure by miles. But *Eratosthenes* precisely noteth, that it is 625 miles. *Artemidorus* but 600. *Schoßus* affirmeth, That from the frontiers of Egypt it is 1675 miles. From whence, the last rehearsed Writers count forward but 1270. But all this difference and dispute about this point, is lately determined & ended by the report of those traueellers whom *Nero* sent of purpose to discover those countries; & they made relation of the truth vpon their certain knowledge, that it is 874 miles from Syene in this maner particularly by iournies. Namely, from the said Syene to Hiera-Sycaminon 54 miles: from thence to Tama 75 miles: from Tama to the Eunymites country, the first of all the *Ethiopian*s, 120. Forward to Acina 54. To Pitara 25. To Tergedum 106 miles. Where by the way it is to be noted, that in the midst of this tract lieth the Island Gagandus: where they began first to haue a sight of the birds called Parats; & beyond another Isle in the same way which is called Artigula, they might see monies & marmosets: but being once beyond Tergedum, they met with the beasts Cynocephali. From thence to Napata 80 miles: this is the only little town among all the rest before named. From which to the Island Meroe is 360 miles. They reported moreover, that about Meroe (& not before) the grasse and herbs appeared fresh and green, yea, and the woods shewed somewhat in comparison of all the way besides, and that they espied the tracts of Elephants & Rhinoceroses where they had gone. As for the town it selfe Meroe, they said it was within the Isle from the very entrie therof 70 miles: & that iust by, there was another Island called Tatu, which yeelded a bay or haven to land at for them that took the arme & channell of Nilus on the tight hand. As for the building within Meroe, there were but few houses in it: that the Isle was subject to a lady or queen named Candace, a name that for many yerres already went from one queen to another successiue. Within this town there is the temple of great holinesse and deuotion in the honor of *Iupiter Hammon*: and in all that tract many other chappels. Finally, so long as the *Ethiopian*s swaied the scepter and reigned, this Island was much renowned & very famous. For by report, they were wont to furnish the *Ethiopian* king with armed men 250000, & to maintain of Artisans 400000. Last of all there haue bin counted 45 kings of the *Ethiopian*s, and so it is reported at this day.

CHAP. XXX.

¶ The manifold, strange, and wonderfull formes and shapes of men.

ALl *Ethiopia* in generall was in old time called *Etheria*: afterwards *Atlantia*: and finally of *Vulcan* son *Ethiops*, it took the name *Ethiopia*. No wonder it is, that about the coasts thereof there be found both men and beasts of strange and monstrous shapes, considering the agilitie of the suns fierie heat, so strong and powerfull in those countries, which is able to frame bodies artificially of sundry proportions, and to imprint and graue in them diuers forms. Certes, reported it is, that far within the country Eastward there are a kinde of people without any nose at all on their face, hauing their visage all plain and flat. Others again without any upper lip, and some tonguelesse. Moreover, there is a kinde of them that want a mouth, framed apart from their nose-thrills: and at one and the same hole, and no more, taketh in breath, receiuethe drinke by drawing it in with an oaten straw; yea, and after the same maner feed themselves with the grains of oats, growing on the own accord without mans labour and tillage, for their only food. And others there be, who in stead of speech and words, make signes, as well with nodding their heads, as mouing their other members. There are also among them, that before the time of *Ptolomæus Lathyrus* king of Egypt, knew no use at all of fire. Furthermore, writers there be, who haue reported, that in the country neere vnto the meeres and marshes from whence Nilus issueth, there inhabit those little dwarfs called Pygmei. But to return againe to the utmost coasts of *Ethiopia*, where we left: there is a continuall ranage and course of mountains all red like fire, as if they were euer burning. Moreover, beyond Meroe there is a country lying above the Trogilodites and the red sea: where, after you be three daies iourney from Napata toward the coast of the said red sea, you shall find that in most places they saue raine water for their ordinarie use to drinke, and otherwise: all the country betwene is very plenteous and full

A of gold mines. All beyond this region is inhabited by the Atabuli, a people also of *Ethiopia*. As for the Megabares, whom some haue named Adiabares, they lie against Meroe, and haue a towne bearing the name of *Apollo*. Among them are certain Nomades encamping vnder tents and tabernacles, who liue of Elephants flesh. Iust against them in a part of *Africa* are the long liuing Macrobians. Again, being past the Megabares, you come vnto the Memnonnes & Daveli: & 20 daies iourney from them, to the Critenses. Beyond whom you meet with the Dochi, and the Gymnetes who are euer naked. Soon after you shall find the Anderæ, Mathitæ, Mefagebes, Hipporeæ, who be all ouer blacke, and therefore they colour and paint their bodies with a kinde of red chalk or ruddle called Rubrica. But vpon the coast of *Africa* are the Medimni. Beyond whom you shall come to another sort of Nomades liuing vnder tents, who feed of no other thing but the milk of certain creatures headed like dogs, called Cynocephali: also to the Olabi and Syrbotæ, who are reported to be 8 cubits high. Moreover, *Aristocreon* saith, that on Libya side, five daies iourney from Meroe, there is a town called Tole: & 12 daies iourney from thence, there standeth Efar, a town built by the Egyptians, who fled thither to auoid the cruelty and tyrannie of *K. Psammeticus*. And reported it is, that the Egyptians held it for 300 yerres. Also, that the same fugitiues founded the towne Daron on the contrary side in the coast of Arabia. But that which *Aristocreon* nameth Efar, *Bion* called Sapa, and saith withall, that the very word Sapa signifieth in the *Ethiopian* language, strangers or aliens come from other parts. Hee affirmeth besides, that their capital city is within an Island, Sembobitis, and that Sai within Arabia, is the third city of that nation. Now between the mountains and the river Nilus, are the Symbarians and the Phalanges: but vpon the very hills liue the Asachæ, who haue many other nations vnder them: and they are by report seuen daies iourney from the sea. They liue vpon the venison of Elephants flesh, which they vse commonly to hunt and chase. As for the Island within Nilus, of the Sembarites, it is subject to a queen. And eight daies iourney from thence lieth the country of the *Ethiopian*s, named Nubari. Their chiefe town Tenupis is seated vpon the river Nilus. Beyond the Nubians, you enter vpon the countrie of the Sambræ: where all the foure-footed beasts, yea, euen the very Elephants, are without ears. Vpon the coast of *Africa* inhabit the Ptoembati and Ptoemphani: who haue a dog for their king, and him they obey, according to the signes which he maketh by mouing the parts of his bodie, which they take to be his commandements, and religiously they do obserue them. Their head citie is Aurispi, far distant from Nilus. Beyond them are the Achisarmi, Phaliges, Marigeri, and Casamarri. *Bion* affirmeth, That beyond Ptoembobitis, there be other townes in the Islands of that coast, toward Meroe, all the way as you passe for 20 daies iourney. The towne of the next Island is Sembaritarum, vnder the queen: likewise another called Afar. Also there is a second Island hauing in it the towne Daron: a third which they call Medæ, wherein standeth the town Afel: and a fourth named Garode, like as the towne also. Then along the banks of Nilus are many townes, to wit, Navos, Modunda, Andabis, Setundum, Colligar, Secande, Navestabe, Cumi, Agrospi, Egipa, Candrogari, Araba, and Summara. The region about Sirbithim, where the mountains do end, is reported to haue vpon the sea coast certaine *Ethiopian*s called Nisicastes and Nisres, that is to say, men with three or foure eies apiece: not for that they are so eied indeed, but because they are excellent archers, & haue a speciall good eie in aiming at their marke, which lightly they wil not misse. *Bion* affirmeth moreover, That from that clime of the heauen which beares about the greater Syrtis, & bendeth toward the South Ocean sea, they be called Dalion, to wit, the Ciforians and Longopores, who drinke and vse rain water only. And beyond Ocalices for five daies iourney, the Visbalks, Isuelians, Pharuseans, Valians and Cifpians. All the rest are nothing but deserts not inhabited. But then he telleth fabulous and incredible tales of those countries. Namely, that Westward there are people called Nigroæ, whose king hath but one eie, and that in the mids of his forehead. Also he talketh of the Agriophagi, who liue most of panthers and lions flesh. Likewise of the Pomphagi, who eat all things whatsoever. Moreover, of the Antiropophagi, that feed on mans flesh. Furthermore, of the Cynamolgi, who hate heads like dogs.ouer and besides, the Artabatites who wander and go vp and downe in the footes like fourefooted sauge beasts. Beyond whom, as he saith, be the Hesperij, & Peroæi, who, as we said before, were planted in the confines of Mauritania. In certain parts also of *Ethiopia* the people liue of Locusts only, which they powder with salt, and hang vp in smoke to harden; for their yerely prouision, and these liue not about 40 yerres at the most. Finally, *Agrippa* saith that

that all Ethiopia, and take the land with it of *Prester Iehan* bordering vpon the red sea, containeth in length 2170 miles: & in bredth, together with the higher Egypt, 1291. Some Geographers haue taken the bredth in this manner. From Miroc to Sirbitum, 12 daies iournie vpon Nilus: from thence to the country of the Dauillians another 12, and from them to the Ethiopian Ocean 6 daies. But in general all writers in a manner do resolute vpon this, that betweene Ocean and Meroe, it is 725 miles: and from thence to Syene, as much as we haue set downe before. As for the posture and scituation of Ethiopia, it lies Southeast & Southwest. In the meridian South parts thereof, there be great woods of Ebene especially, alwaies greene. Toward the mids of this region, there is a mighty high mountain looking ouer the sea, that burns continually, which the Greeks cal Theon ochema, i. The chariot of the gods: from the which it is counted foure daies iourny by sea to the promontory or cape called Hesperion-Ceras, which confines vpon Africk, nere to the Hesperian Ethiopians. Some writers hold, that this tract is beautified with pretty little hills, and those pleasantly clad & garnished with shadowie groues, wherein the *Ægipanes* and *Satyres* do conuerse.

Cap. de bonne
Esperance

CHAP. XXXI. The Islands in the *Æthiopian Sea*.

Ephorus, Eudoxus, and Timosthenes, do all agree in this, that there be very many Islands in all that sea. *Clitarchus* witnesseth, that report was made to *Alexander the Great*, of one aboue the rest, which was so rich and well monied, that for an ordinary horse the inhabitants would not stick to giue a talent of gold: also of another, wherein was found a sacred hill adorned with a goodly wood vpon it, where the trees distilled and dropped sweet water of a wonderfull odoriferous smell. Moreover, full against the Persian gulf, lieth the Isle named Cerne, opposit vnto *Æthiopia*, but how large it is, or how far off it beareth into the sea from the continent, is not certainly knowne: this only is reported, that the Ethiopians and none but they, are the inhabitants thereof. *Ephorus* writeth, that they who would faile thither from the red sea, are not able for extreme heate to passe beyond certain columnes or pillars, for so they call the little Isles there. Howbeit *Polybius* auoucheth, that this Island Cerne where it lieth in the westmost coast of the Mauritanian sea ouer-against the mountaine Atlas, is but 8 stadia from the land. And *Cornelius Nepos* affirmeth, that likewise it is not aboue a mile from the land, ouer-against Carthage: & besides, that it is not aboue two miles in circuit. There is mention made also by authors, of another Isle before the said mountain Atlas, named also therupon Atlantis. And siue daies sailing from it, appeare the desarts of the Ethiopian Hesperians, together with the foresaid cape, which we named Hesperion-Ceras, where the coasts of the land begin first to turn about their forefront to wind Westward, and regard the Atlanticke sea. Iust ouer-against this cape, as *Xenophon Lampscenus* reporteth, lye the Islands called Gorgates, where sometimes the Gorgones kept their habitation, and 2 daies sailing they are thought to be from the firme land. *Hanno*, a great commander and generall of the Carthaginians, landed there with an army: who made this report from thence, That the women were all ouer their bodies hairy: as for the men, he could not catch one of them, so swift they were of foot that they escaped out of all sight: but he flead two of these Gorgone women and brought away their skins, which for a testimoniall of his being there, and for a wonder to posteritie, he hung vp in *Tunoes* temple, where they were seen vntill Carthage was won and sacked. Beyond these Isles, there are by report, two more discovered, by the name of Hesperides. But so vncertaine are all the intelligences deliuered concerning these parts, that *Strabo Scobolus* affirmeth, that it is 40 good daies sailing from the Islands of these Gorgones along the coast of Atlas, vnto the Isles of the Hesperides; and from thence to Hesperion-Ceras, but one. As little resolution and certaintie there is, as touching the Islands of Mauritania. In this only they all jumpe and accord, that *K. Iuba* discovered some few of them ouer-against the Autolotes, in which he meant and purposed to die *Gætulian* purple.

CHAP. XXXII.

¶ Of the Islands Fortunata, or Canarie.

Some Authors there bewho thinke, that the Islands Fortunata, and certaine others besides them, are beyond the Antolotes: among whom, the same *Scobolus* aboue rehearsed was so bold, as to speake of their distances: and namely, that the Island Iunonia is from Gades 750 miles:

A 750 miles: and that from it Westward, the Isles Pluvialia and Capraria, are as much. Also that in the Island Pluvialia there is no fresh water, but only that which they haue by showrs of rain. He saith moreover, that from them to the Fortunate Islands are 250 miles; which lie 8 miles from the coast of Mauritania to the leift hand, called the coast of the Sun, or Valley of the sun, for that it is like a valley or hollow leuell flore of earth, whereupon also it is called Planaria, resembling an euen plain. And in very truth, this vally containeth in circuit 300 miles: wherein are trees to be seen that grow vp in height to 144 foot. As for the Islands named Fortunata, *Iuba* learned thus much by diligent inquisition, that they lie from the South nere to the West 625 miles from the Islands Purpuraria, where they die purple; so as to come thither, a man must saile 250 miles aboue the West, and then for 75 miles more bend his coust Eastward: he saith also, that the first of these Islands is called Ombrion, wherein ate to be seen no token or shew at all of houses. Also that among the mountains, it hath a lake or meere: and trees resembling the plant Ferula, out of which they presse water: that which issueth out of the black trees of that kinde, is bitter; but out of the whiter sort, sweet and potable. As for a second, he writeth that it is named Iunonia, wherein there is one little house or chappell made of stone: beyond it, but nere by, there is a third of the same name, but lesse than the other: and then you come to a fourth called Capraria, full of great Lizards. Within a kenning from these, lieth the Island Niuaria, which tooke this name of the snow that lieth there continually, and besides, it is full of mists and fogs. The next to it and the last of all, is Canaria, so called, by reason of a number of dogs of mighty bignesse, of which *K. Iuba* brought away two; & in this Island there are some marks remaining of buildings which giue testimonie that sometime it was inhabited and peopled. And as all these Islands generally do abound plentifully in fruitfull trees, & flying fouls of all sorts: so this aboue the rest named Canaria, is replenished with rowes of date trees that beare abundance of dates, and likewise with pine trees that yeeld store of Pine nuts. Furthermore he affirmeth, that there is great plenty of hony in it: that the riuers therein are well stored with fish, and the Sturgeon especially: in which there groweth the red Papyrus as ordinarily as in Nilus. Howbeit in conclusion he saith, that these Isles are much annoied with great whales and such monsters of the sea, that daily are cast vpon the shore, which lie aboue ground & putrifie like carrion. Thus hauing at large gone through the description of the globe of the earth as well without as within, it remaineth now to knit vp briefly with the measure and compasse of the seas.

CHAP. XXXIII.

¶ A summarie of the earth, digested according to the dimensions thereof.

Polybius saith, that from the streights of Gibraltar, vnto the very mouth and firth of *Mæotis*, it is found by a direct and straight course to be 3437 miles and an halfe. Begin there again, and hold on a right course Eastward to Sicily, it is 1260 miles and an halfe. From thence forward to the Island Creta, 375 miles: forward to Rhodes, 146 miles and an halfe: to the Chelidonie Isles as much, and so to Cyprus 325 miles: from whence to Seleucia Pieria in Syria 115 miles. Which particulars being laid together, make by computation the grosse sum of 2340 miles. Howbeit, *Arrippa* counteth 3440 miles for all this distance aboue-said, beginning at the straits of Gibraltar aboue-said, and carrying the length straight forward to the gulf of Issa. In which reckoning of his, I wot not whether ther be an error in the number, forasmuch as the same writer hath set down from the streit of Messine in Sicilie to Alexandria in Egypt, 1250 miles. As for the whole circuit that may be comprehending therein, all the gulfs and creekes before-named, from the same point where we first began, as far as to the lake *Mæotis*, is 15600 miles. *Artemidorus* addeth thereto 756 miles. And the same Geographer writeth, that take the lake *Mæotis* to the rest, all commeth to 17390 miles. Loe, what the measure is of the seas taken by Philosophers and learned men, without armor and weapon in hand; of men I say, who haue not feared to hazard themselves boldly and prouoke Fortune, in traueising the seas so farre off. Now are we to compare respectiue the greatnesse of each part of the world in seuerall: notwithstanding that I shall finde much ado and difficulty enough therein, considering the disagreement of authors in that behalf. But most plainly shal this appeare which we seek for, by joining longitude & latitude together: according to which prescript rule to begin with

Europe, it may wel contain in largenes 8148 miles. Africk (taking the middle and mean computation between them all that haue set it down) containeth in length 3748 miles. As for the bredth of so much as is known and inhabited, in no place where it is widest exceedeth it 250 miles. True it is, that Agrippa would haue it to contain 910 miles in breadth, beginning at the bounds of Cyrene, and so comprehending in this measure the desarts thereof as far as to the Garamants, so far as is knowne and discovered, and then the whole measure collected into one generall sum, amounteth to 4608 miles. As for Asia, confessed it is and resolved vpon by all Geographers, that in length it carrieth 63750 miles: and verily in bredth (if you account from the Ethiopian sea to Alexandria scituate vpon Nilus, so as your measure run through Meroe and Syrene) it taketh 1875 miles: wherby it appeareth euidently, that Europe is little wanting of halfe as big again as Asia: and the same Europa, is twise as much again as all Africa & a fixt part ouer. Reduce now all these sums together, it wil be found cleare, that Europ is a third part of the whole earth, & an eight portion ouer and somwhat more: Asia, a fourth part, with an ouer-deale of 14: and Africk a fiftth part, with an ouer-plus of a sixtieth portion. To this calculation, we wil set to, as it were to boot, one subtile deuise & inuention more of the Greeks, which sheweth their singular wit (to the end we should omit nothing that may serue our turn in this Geographic of ouers) and that is this: after that the posture and site of euery region is knowne and set downe, how a man may likewise come to the knowledge what societie and agreement there is between the one & the other, either by length of daies and nights, by the shadow at noon day, or by equality of climats of the world. To bring this about effectually, I must part and digest the whole earth into certain sections or euen portions, answerable to those in heauen; whereof there be very many) which our Astronomers and Mathematicians call Circles; but the Greeks, Parallels.

CHAP. XXXIV.

¶ The diuision of the earth into Climats or lines Parallele, and equall shadowes.

FOR to make an equall partition of the world, begin we wil at the Meridionall Indians, & go directly as far as Arabia, and the inhabitants of the red sea Vnder this climat are comprehended the Gedrosians, Persians, Carmanes, and Elimians: Parthyene, Aria, Susiane, Mesopotomia, Seleucia synnamed Babylonia, Arabia, so far as Petra inclusiuely, Coele-Syria, & Pelusium in Egypt: the low Low-countries, which are called the tract of Alexandria: the maritime coasts of Africk: all the towns of Cyrenaica, Thapsus, Adrumetum, Clupea, Carthage, Vtica, both Hippos, Numidia, both realmes of Mauritania, the Atlanticke sea, and Hercules pillars. In all the circumference of this climat and parallele, at noon tide vpon an Equinoctiall day, the stile in the diall which they call Gnomon 7 foot long, casteth a shadow not aboue 4 foot. The longest night or day in this climate, is 14 houres: and contrariwise the shortest, ten. The second circle or parallele line, beginneth at the Indians Occidentall, and passeth through the mids of Parthia, Persepolis, the hithermost parts of Persis (in respect of Rome) the hither coast of Arabia, Iudaea, and the borders neere vnto the mountaine Libanus. Vnder the same are contained also Babylonia, Idumaea, Samaria, Hierusalem, Ascalon, Ioppe, Casarea, Phenice, Ptolemais, Sydon, Tyrus, Berytus, Betrys, Tripolis, Byblus, Antiochia, Laodicea, Seleucia, the Sea coasts of Cilicia, Cyprus the South part of Candy, Lilybæum in Sicilia, the North parts of Africke and Numidia. The Gnomon in a diall vpon the Equinoctiall day 35 foot of length, maketh a shadow 24 foot long. The longest day or night is 14 houres Equinoctiall, and the fift part of an houre. The third circle beginneth at the Indians next vnto the mountaine Imaus, and goeth by the Caspian gates or streights hard by Media, Cataonia, Cappadocia, Taurus, Amanus, Iffus, the Cilician straits, Soli, Tarsus, Cyprus, Pisidia, Syde in Pamphilia, Lycaonia, Patara in Lycia, Xanthus, Caunus, Rhodus, Cous, Halicarnassus, Gnidus, Doris, Chius, Delus, the mids of the Cyclades, Gythium, Malea, Argos, Laconia, Elis, Olympia, Messene, Peloponnesus, Syracusa, Carinae, the mids of Sicily, the South part of Sardinia, Cardei, and Gades. In this climat the Gnomon of 100 inches, yeeldeth a shadow of 77 inches. The longest day hath Equinoctiall houres 14 & an halfe: with a 30 part ouer. Vnder the fourth circle or parallele lye they that are on the other side of Imaus, the South parts of Cappadocia, Galatia, Mysia, Sardis,

- A Sardis, Smyrna, Sipylus, the mountaine Tmolus in Lydia, Caria, Ionia, Trallis, Colophon, Ephesus, Milerus, Samos, Chios, the Icarian sea, the Isles Cyclades lying Northward, Athens, Megara, Corinth, Sicyon, Achæa, Patra, Isthmos, Epirus, the North parts of Sicily, * Narbonensis Gallia toward the East, the maritime parts of Spaine beyond new Carthage, and so into the West. To a Gnomon of 21 foot, the shadowes answer of 17 foot. The longest day is fourteen Equinoctiall houres, and two third parts of an houre. The 5 diuision containeth vnder it, from the entrance of the Caspian sea, Baetra, Iberia, Armenia, Mysia, Phrygia, Hellepontus, Troas, Tenedus, Abydus, Scepsis, Ilium, the hill Ida, Cyzicum, Lampfacum, Sinope, Anisum, Heraclea in Pontus, Paphlagonia, Lemnus, Imbrus, Thasus, Cassandria, Thessalia, Macedonia, Larissa, Amphipolis, Thessalonice, Pella, Edeffa, Beræa, Pharsalia, Carystum, Eubœa, Bœotia, Chalcis, Delphi, Acarnania, Ætolia, Apollonia, Brundisium, Tarentum, Thurij, Locri, Rhegium, Lucani, Naples, Puteoli, the Tuscan sea, Corsica, the Balear Isles, the middle of Spain. A Gnomon of 7 foot giueth shadow six foot. The longest day is 15 Equinoctiall houres. The sixt parallell compriseth the city of Rome, and containeth withall the Caspian nations, Caucasus, the North parts of Armenia, Apollonia vpon Rhindacus, Nicomedia, Nicæa, Chalcedon, Bizantium, Lyfimachia, Cherrhonesus, the gulfe Melane, Abdera, Samothracia, Maronea, Ænus, Bessica, the midland parts of Thracia, Pœonia, the Illyrians, Dyrrhachium, Canusium, the vtmost coasts of Apulia, Campania, Hetruria, Pise, Luna, Luca, Genua, Liguria, Antipolis, Massilia, Narbon, Tarracon, the middle of Spain called Tarraconensis, & so through Lusitania.
- C To a Gnomon of 9 foot, the shadow is answerable 8 foot. The longest day hath 15 Equinoctiall houres, and the 9 part of an houre, or the fift, as Nigidius is of opinion. The 7 diuision begins at the other coast of the Caspian sea, and falls vpon Callatis, Bosphorus, Borysthenes, Tomos, the backe parts of Thracia, the Tribals country, the rest of Illyricum, the Adriaticke sea, Aquileia, Altinum, Venice, Viceria, Patavium, Verona, Cremona, Ravenna, Ancona, Picenum, Marfi, Peligni, Sabini, Vmbria, Ariminum, Bononia, Placentia, Mediolanum, and all beyond Apenninum: also ouer the Alps, Aquitane in Gaule, Vienna, Pyreneum, and Celtiberia. The Gnomon of 35 foot, casteth a shadow 36 foot in length; yet so, as in some part of the Venetian territories, the shadow is equall to the Gnomon. The longest day is 15 Equinoctiall houres, and three fift parts of an houre. Hitherto haue we reported the labors in this point of antient
- D Geographers, and what they haue reported. But the most diligent and exactest modern Writers that followed, haue assigned the rest of the earth not yet specified, to three other sections or climats. The first, from Tanais through the lake Mœtis and the Sarmatians, vnto Borysthenes, and so by the Dakes and a part of Germany, containing therein France and the coasts of the Ocean, where the day is 16 houres long. A second, through the Hyperboreans and Britain, where the day is 17 houres long. Last of all is the Scythian parallell, from the Rhiphaean hills into Thule: wherein (as we said) it is day and night continually by turnes, for fixe moneths. The same writers haue set downe two parallell circles, before those points where the other began, and which we set downe. The one through the Islands Meroe and Ptolemais vpon the red sea, built for the hunting of Elephants, where the longest daies are but 12 houres and an halfe: the second passing through Syrene in Ægypt, where the day hath 13 houres. And the same authors haue put to euery one of the other circles, euen to the very last, half an houre more to the daies length than the old Geographers.

Thus much of the Earth.

THE SEVENTH BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS
SECVNDVS.

The Proeme.

THus, as you see, we haue in the former books sufficiently treated of the vniuersall world, of the Lands, Regions, Nations, Seas, Islands, and renowned Cities therein contained. It remains now to discourse of the liuing creatures comprised within the same, and their natures: a point double, for it would require as deepe a speculation as any part else thereof, what soeuer, if so be the spirit and minde of man were able to comprehend and compass all things in the world. And to make a good entrance into this treatise and history, methinks of right we ought to begin at Man, for whose sake it should seeme that Nature made and produced all other creatures besides: though this great fauour of hers, so bountifull and beneficiall in that respect, hath cost them full deare, inasmuch as it is hard to iudge, whether in so doing she hath done the part of a kinde mother, or a hard and cruell step-Dame. For first and formost, of all other liuing creatures, man she hath brought forth all naked, and clothed him with the good and riches of others. To all the rest she hath giuen sufficient to clad them euery one according to their kinde; as namely, shells, cods, hard hides, prickles, shag, bristles, haire, downe feathers, quills, scales, and fleeces of wooll. The very trunks and stumps of trees and plants she hath defended with barke and rinde, yea and the same sometimes double, against the iniuries of heate and cold: Man alone, poore wretch, she hath layed all naked upon the bare earth, euen on his birth day, to cry and wraule presently from the very first houre that hee is borne in such sort, as among so many liuing creatures there is none subiect to shed teares and weepe like him. And verily to no babe or infant is it giuen once to laugh before he be forty daies old, and that is counted very early, and with the soonest. Moreover, so soone as he is entred in this manner to enioy the light of the Sunne, see how he is immediately tyed and bound fast, and hath no member at libertie: a thing that is not practised upon the yong whelpes of any beast among vs, be he neuer so wilde. The childe of man thus vntowardly borne, and who another day is to rule and command all other, loe how he lieth bound hand and foot, weeping and crying, and beginning his life in miserie, as if he were to make amends and satisfaction by his punishment vnto Nature, for this onely fault and trespass, that he is borne aline. O folly of all follies, euer to thinke (considering this simple beginning of ours) that we were sent into this world to liue in pride, and carry our heads aloft! The first hope that we conceiue of our strength, the first gift that Time affoordeth vs, maketh vs no better yet than foure footed beasts. How long is it ere we can go alone? how long before we can prattle and speake, feed our selues, and chew our meat strongly? what a while continueth the mould and crowne of our heads to beate and paine, before our braine is well settled; the vndoubted marke and token that bewraith our exceeding great weaknesse aboue all other creatures? What should I say of the infirmities and sicknesses that do soone seise upon our feeble bodies? what need I speake of so many medicines and remedies deuised against these maladies: besides the new diseases that come euery day, able to checke and frustrate all our prouision of physike what soeuer? As for all other liuing creatures, there is not one, but by a secret instinct of nature knoweth his own good, and wherto he is made able; some make vse of their swift feet, others of their slight wings, some are strong of limbe; others are apt to swim, and practise the same: man only knoweth nothing, vntill he be taught; hee can neither speake, nor goe, nor eat, otherwise than he is trained to it: and to be short, apt and good at nothing he is naturally, but to pule and cry. And hereupon it is, that some haue bene of this opinion.

A opinion, That better it had been, and simply best for a man, neuer to haue been borne, or else speedily to die. None but we doe sorrow and waile, none but we are giuen to excessse and superfluitie infinitely in euery thing, and shew the same in euery member that we haue. Who but we againe are ambitious and vain-glorious? who but we are conctous and greedie of gathering good? we and none but we desire to liue long and neuer to die, are superstitious, carefull of our sepulture and buriall, yea and what shall betide vs when we are gone. Mans life is most fraille of all others; and in leass securitie he liueth: no creature lusteth more after euery thing than he: none feareth like vnto him, and is more troubled and amazed in his fright: and if he be once vpon anger, none more raging and wood than he. To conclud, all other liuing creatures liue orderly and well, after their owne kinde: we see them flocke and gad together, and ready to make head and stand against all others of a contrary kinde: the Lyons as fell and sauage as they be, fight not one with another; serpents sting not serpents, nor bite one another with their venomous teeth: nay the very monsters and huge fishes of the sea, war not among themselves in their owne kinde: but belecue me, Man at mans hand receiveth most harme and mischiefe.

CHAP. I.

The strange and wondrous shipes of sundry nations.

IN our Cosmographie and reports of nations and countries, wee haue spoken in generall of all mankind, spread ouer the face of the whole earth: neither is it our purpose at this present to decipher particularly all their customs and manners of life, which were a difficult enterprize, considering how infinit they be, and as many in manner as there be societies and assemblies of men. Howbeit I thinke it good, not to ouer-passe all, but to make relation of some things concerning those people especially, who liue farthest remote from our seas; among whom I doubt not but I shall find such matter, as to most men will seeme both prodigious and incredible. And verily who euer beleeued that the Aethiopians had bin so blacke, before he saw them with his eyes: nay what is it, I pray you, that seemeth not a wonder at the first sight? How many things are judged impossible before they are seene done and effected? And certes, to speake a truth, The power and majestic of Nature, in euery particular action of hers & small things, seemeth incredible, if a man consider the same seuerally, and enter not into a generall conceit of her wholly as she is. For to say nothing of the painted peacocks feathers, of the sundry spots of tygres, luzernes, and panthers, of the variable colours and markes of so many creatures besides: let vs come to one only point, which to speake of seemes but small, but being deeply weighed and considered, is a matter of exceeding great regard, and that is, The varietie of mens speech; so many tongues and diuers languages are amongst them in the world, that one stranger to another seemeth well-nere to be no man at all. But come to view and marke the varietie that appeares in our face and visage, albeit there be not past ten parts or little more therein, see how among so many thousands as we are, you shall not find any two persons, who are not distinct in countenance and different one from another: a thing that no artificer nor painter (be he neuer so cunning and his craftinafter euery way) can performe, but in a few pictures, and take what heed he can with all his curious affection. And yet thus much must I aduertise the readers of this mine history by the way, that I will not pawne my credit for many things that herein I shall deliuer, nor bind them to belecue all I write as touching strange and forrein nations: refer them rather I will to mine authors, whom in all points (more doubtfull than the rest) I will cite and alledge, whom they may belecue if they list: onely let them not thinke much to follow the Greeke writers, who from time to time in this behalfe haue been more diligent in penning, and more curious in searching after antiquities.

CHAP. II.

Of the Scythians, and the diuersitie of other nations.

THAT there bee Scythians, yea, and many kindes of them that feed ordinarily of mans flesh, wee haue shewed already in our former discourses. A report haply that would be thought incredible, if we did not consider and thinke withall, how in the very middle and heart of the world, euen in Sicily and Italy, here hard by, there haue bene such monsters of men,

men, namely, the Cyclopes and Lystrigones: nay, if we were not credibly informed, that euen of late daies, and go no farther than to the other side of the Alpes, there be those that kill men for sacrifice after the maner of those Scythian people; & that wants not much of chewing and eating their flesh. Moreouer, nere vnto those Scythians that inhabit toward the pole Articke, and not far from that climate which is vader the very rising of the North-east wind, and about that famous caue or whole out of which that wind is said to issue, which place they call Gesclichron, [i. the cloister or key of the earth] the Arimaspians by report do dwell, who as we haue said before, are known by this marke, for hauing one eie only in the mids of their forehead: and these maintain war ordinarily about the mettall mines of gold, especially with griffons, a kind of wilde beasts that flie, and vse to fetch gold out of the veins of those mines (as commonly it is received:) which sauage beasts (as many authors haue recorded, and namely, *Herodotus* & *Aristotle* the Proconneian, two writers of greatest name) strue as eagerly to keepe and hold those golden mines, as the Arimaspians to disseize them therof, and to get away the gold from them. About those, are other Scythians called Anthropophagi, where is a countrie named Abarimon, within a certain vaile of the mountain Imaus, wherein are found sauage & wild men, liuing and conuersing vsually among the bruit beasts, who haue their feet growing backward, & turned behind the calves of their legs, howbeit they run most swiftly. These kinde of men can endure to liue in no other aire nor in any climate else than their own, which is the reason that they cannot be drawne to come vnto other kings that border vpon them, nor could be brought vnto *Alexander* the great: as *Beton* hath reported, the marshall of that princes campe, & who also put downe his gists and iournies in writing. The former Anthropophagi or eaters of mans flesh, whom we haue placed about the North-pole, ten daies iourne by land about the riuer Borysthenes, vse to drink out of the skuls of mens heads, and to weare the scalpes haire & al, in stead of mandellions or stomachers before their breasts, according as *Isgonus* the Niccan witnesseth. The same writer affirmeth moreover, That in Albanie there be a sort of people borne with eies like owles, whereof the sight is fire red: who from their childhood are grey headed, and can see better by night than day. He reporteth also, that tenne daies iourne beyond Borysthenes, the Sauramates neuer eat but one meale of meat in three daies. *Crates* of Pergamus saith, That in Hellespont about Parium there was a kind of men (whom he nameth Ophiogenes) that if one were stung with a serpent, with touching only, will ease the paine: and if they doe but lay their hands vpon the wound, are wont to draw forth all the venome out of the body. And *Varro* testifies, that euen at this day there be some there who warish & cure the stinging of serpents with their spittle, but there are but few such, as he saith. *Agatharcides* writes, that in Affricke the Psyllians (so called of king *Psyllus*, from whose race they were descended, and whose sepulchre or tombe is at this day present to be seene in a part of the greater Syrtis) could do the like. These men had naturally that in their own bodies, which like a deadly bane and poyson would kill all serpents: for the very aire & sent that breathed from them, was able to stupifie and strike them starke dead. And by this means they vsed to try the chastitie and honestie of their wiues. For so soon as they were deliuered of children, their manner was to expose and present the silly babes new borne, vnto the most full and cruell serpents they could find: for if they were not right, but gotten in adultery, the said serpents would not auoid & fly from them. This nation verily in generall hath been defeated, & killed vp in manner all by the Nasamonnes, who now inhabit those parts wherein they dwelt: howbeit a kind remains still of them, descended from those that made shift away and fled, or else were not present at the said bloody battell, but there are very few of them at this day left. The Marsians in Italy at this present continue with the like naturall vertue against serpents: whom being reputed for to haue descended from ladie *Circus* son, the people in this regard do highly esteeme, & are verily perswaded, that they haue in them the same facultie by kinde. And what great wonder is this, considering that all men carry about them that which is poyson to serpents: for if it be true that is reported, they will no better abide the touching with mans spittle, than scalding water cast vpon them: but if it happen to light within their chawes, or mouth, especially if it come from a man that is fasting, it is present death. Beyond those Nasamonnes, and their neighbours confining vpon them (the Machlyes) there be found ordinarily Hermaphrodites, called Androgyni, of a double nature, and resembling both sexes, male and female, who haue carnal knowledge one of another interchangeably by turns, as *Callisthanes* reports. *Aristotle* saith moreover, that on the right side of their breast they haue a little

A the teat or nipple like a man, but on the left they haue a full pap or dug like a woman. In the same Affricke, both *Isgonus* and *Nymphodorus* doe auouch, there be certain houses and families of forcerers: who, if they chance to blesse, praise, and speak good words, bewitch presently with all; in so much as sheepe therewith die, trees wither, and infants pine and winder away. *Isgonus* adds furthermore, That such like there be among the Triballians and Illyrians, who with their very eyesight can witch, yea, and kil those whom they look wisely vpon any long time, especially if they be angered, and that their eies bewray their anger: and more subiect to this daunger be men growne, than children vnder fourteene yeares of age. This also is in them more notable and to be obserued, that in either eie they haue two sights or apples. Of this kind and property, as *Apollonides* mine author saith, there be certaine women in Scythia named Bithyæ. *Philarchus* witnesseth, That in Pontus also the whole race of the Thibians, and many others besides, haue the same quality, & doe the like: and known they are (saith he) by these markes. In one of their eies they haue two sights, in the other the print or resemblance of an horse. He reports besides of these men, that they will neuer sinke or drowne in the water, be they charged neuer so much with weighty and heauy apparel. Not vnlike to these there are a people in Æthiopia called Pharnaces, whose sweat if it chance to touch a mans body, presently he falleth into a phthisick or consumption of the lungs. And *Cicero* a Roman writer here among vs testifieth, that generally all women that haue such double apples in their eies, haue a venomous sight, and doe hurt therewith. See how nature, hauing engrafted naturally in some men this vnkind appetite (like wild beasts) to feed commonly vpon the bowels and flesh of men, hath taken delight also & pleasure to giue them inbred poisons in their whol body, yea & venom in the very eies of some, that there should be no naughtinesse in the world againe, but the same might be found in man. Not farre from Rome city, within the territory of the Falisci, there be some few houses, & families called Hirpiæ, which at their solemne yearly sacrifice celebrated by them in the honour of *Apollo* vpon the mount Sorecte, walke vpon the pile of wood as it is on fire, in great iolity, and neuer a whit are burnt withall. For which cause it is ordained by an expresse aret or act of the Senat, that they should be priuiledged, and haue immunity of warfare and all other seruices whatsoeuer. Some men there be that haue certaine members and parts of their bodies naturally working strange and miraculous effects, and in some cases medicinable. As for example, king *Pyrrhus*, whose great toe of his right foot was good for them that had big, swelled, or indurate spleenes, if he did but touch the parties diseased, with that toe. And they say moreover, that when the rest of his body was burnt (after the manner) in the funerall fire, that great toe the fire had no power to consume: so, that it was bestowed in a little case for the nones, and hung vp in the temple for a holy relique. But principally about all other countries, India and the whole tract of Æthiopia is full of these strange and miraculous things. And first & formost the beasts bred in India be very big, as it may appeare by their dogs, which for proportion are much greater than those in other parts. And trees grow there to that tallnesse, that a man cannot shoot a shaft ouer them. The reason hereof is the goodnesse and fatnesse of the ground, the temperat constitution of the aire, and the abundance of water: which is the cause also that vnder one fig tree [beleue it that list] there may certaine troupes and squadrons of horsemen stand in couert, shaded with the boughes. And as for reeds, they be of such a length, that between eury ioint they will yeeld sufficient to make boats able to receiue three men apeece, for to row therein at ease. There are to be seene many men there aboute fise cubits tall: neuer are they known once to spit: troubled they are not with pain in the head, tooth-ach, or griefe of the eies; and seldome or neuer complaine they of any forance in other parts of the body, so hardy are they, and of so strong a constitution thorough the moderat heat of the Sun.ouer and besides, among the Indians be certain Philosophers, whom they call Gymnosophists, who from the Sun rising to the setting thereof are able to endure all the day long, looking full against the Sunne, without winking or once mouing their eies: & from morning to night can abide to stand sometimes vpon one leg, and sometimes on the other in the sand, as scalding hot as it is. Vpon a certaine mountaine named Milus, there be men whose feet grow the tother way backward, and of either foot they haue eight toes, as *Megasthenes* doth report. And in many other hills of that country, there is a kind of men with heads like dogs, clad all ouer with skins of wild beasts, who in lieu of speech vse to bark: armed they are and well appointed with sharp and trenchant nailes: they liue vpon the prey which they get by chasing wild beasts, & fowling. *Ctesias* writes that

that there were discovered and knowne of them about 120000 in number. By whose report also, in a certaine country of India the women beare but once in their life, and their infants presently waxe grey so soone as they are borne into the world. Also, that there is a kind of people named Monocelli, that haue but one leg apeece, but they are most nimble, and hop wondrous swiftly. The same men are also called Sciopodes, for that in hottest season of the Summer, they ly along on their back, and defend themselves with their feet against the Suns heate: and these people as he saith are not farre from the Troglodites. Againe, beyond these Westward, some there be without heads standing vpon their necks, who cary eies in their shoulders. Among the Westerne mountains of India the Satyres haunt, (the country wherein they be, is called the region of the Cartaduli) creatures of all other most swift in footmanship: which one whiles run with all foure, otherwhiles vpon two feet only like men: but so light footed they are, that vnlesse they be very old and sick, they can neuer be taken. *Tauron* writeth, That the Choromandæ are a sauage and wild people: distinct voice and speech they haue none, but in stead thereof, they keep an horrible gnashing and hideous noise: rough they are and hairy all ouer their bodies, eies they haue red like the houlers, and toothed they be like dogs. *Eudoxus* saith, That in the Southern parts of India, the men kind haue feet a cubit long, but the women so short & smal, that thereupon they be called Struthopodes, i. sparrow footed. *Megasthenes* is my Author, that among the Indian Nomades there is a kind of people, that in stead of noses haue only two smal holes, and after the manner of snakes they haue their legs & feet limmer, wherewith they crawl and creep, and named they are Syriæ. In the vtmost marches of India, Eastward, about the source & head of the riuer Ganges, there is a nation called the Astomes, for that they haue no mouths: all hairy ouer the whole body, yet clothed with soft cotton and down that come from the leaues of trees: they liue only by the aire, and smelling to sweet odors, which they draw in at their nostrils. No meat nor drinke they take, only pleasant fauours from diuers and sundry roots, floures, and wild fruits growing in the woods they entertaine: and those they vse to carry about with them when they take any farre journey, because they would not misse their smelling. And yet if the sent be any thing strong and stinking, they are soone therewith ouercome, & dy withal. Higher in the country, and about these, even in the edge and skirts of the mountains, the Pygmæi *Spythamæi* are reported to be: called they are so, for that they are but a cubit * or three * shaftments (or spannes) high, that is to say, three times nine inches. The clime wherein they dwel is very wholesome, the air healthy, and euer like to the temperature of the Spring: by reason that the mountains are on the North side of them, & beare off all cold blasts. And these pretty people *Homæ* also hath reported to be much troubled & annoyed by cranes. The speech goeth, that in the Spring time they set out all of them in battell aray, mounted vpon the backe of rammes and goats, armed with bowes and arrowes, and so downe to the sea side they march, where they make foule worke among the egges & yong cranelings newly hatched, which they destroy without all pittie. Thus for three months this their journey and expedition continueth, and then they make an end of their valiant seruice: for otherwise if they should continue any longer, they were neuer able to withstand the new flights of this foule, grown to some strength and bignesse. As for their houses and cottages, made they are of clay or mud, fouls feathers, and birds egge shels. Howbeit, *Aristotle* writes, That these Pygmæans liue in hollow caues & holes vnder the ground. For all other matters he reports the same that all the rest. *Isoconus* saith, that certain Indians named *Cyni*, liue a hundred and fortie yeares. The like he thinketh of the *Æthyopian* *Macrobij*, and the *Seres* as also of them that dwell on the mount *Athos*: and of these last rehearsed, the reason verily is rendred to be thus, because they feed of vipers flesh, & therefore is it that neither lice breed in their heads, nor other vermine in their cloths, for to hurt & annoy their bodies. *Onesicritus* affirmeth, That in those parts of India where there are no shadowes to be seene, the men are five cubits of stature, and two hand breadths ouer: that they liue 130 yeares, and neuer age for all that and seem old, but die then, as if they were in their middle and settled age. *Crates* of Pergamus nameth those Indians who liue about an hundred yeare, *Gymnetes*: but others there be, and those not a few, that call them *Macrobij*. *Ctesias* saith there is a race or kindred of the Indians named *Pandore*, inhabiting certaine vallies, who liue two hundred yeares: in their youthfull time the haire of their head is white, but as they grow to age, waxeth black. Contrariwise, others there be neer neighbours to the *Macrobij*, who exceed not fortie yeares, and their women beare but once in their life time. And this also is auouched by *Aenarchides*,

Aenarchides, who affirmeth moreouer, that all their feeding is vpon locusts, and that they are very quicke and swift of foot. *Clitarchus* and *Megasthenes* both name them *Mandri*, and thinke they haue 300 villages in their country. Moreouer, that the women bring forth children at seven yeares of age, and wax old at forty. *Artemidorus* affirmeth, that in the Island *Taprobana* the people liue exceeding long without any malady or infirmite of the body. *Darius* maketh report, That certaine Indians ingender with beasts, of which generation are bred certaine monstrous mungrels halfe beasts and halfe men. Also, that the *Calingian* women of India conceiue with childe at five yeares of age, and liue not about eight. In another tract of that countrey there be certaine men with long shagged tailes, most swift and light of foot: and some againe that with their eares couer their whole body. The *Orites* are neighbours to the Indians, diuided onely from them by the riuer *Arbis*, who are acquainted with no other meate but fish, which they split and slice into pieces with their nailes, and rost them against the Sun, and then make bread thereof, as *Clitarchus* reporteth. *Crates* of Pergamus saith likewise, that the *Troglodites* about *Ethiopia* be swifter than horses: and that some *Æthiopian* are about eight cubites high: and these are a kinde of *Ethiopian* Nomades, called *Syrbotæ*, as he saith, dwelling along the riuer *Astapus* toward the North pole. As for the nation called *Menismini*, they dwel from the Ocean sea twenty dayes journey, who liue of the milke of certain beasts that we call *Cynocephales*, hauing heads and snouts like dogs. And whole herds and flocks of the females they keepe and feed, killing the male of them all, saue onely to serue for maintenance of the breed. In the deserts of *Africke* ye shall meet oftentimes with *Fairies*, appearing in the shape of men and women, but they vanish soone away like fantastical delusions. See how Nature is disposed for the nones to deuise full wittily in this and such like pastimes to play with mankind, thereby not only to make her self merry, but to set vs a wondring at such strange miracles. And I assure you, thus dayly and houely in a manner playeth she her part, that to recount euery one of her sports by themselves, no man is able with all his wit and memory. Let it suffice therefore to testifie and declare her power, that we haue set downe those prodigious and strange workes of hers shewed in whole nations: and then go forward to discourse of some particulars approved and knowne in man.

CHAP. III.

Of prodigious and monstrous births.

That women may bring forth three at one birth appeares evidently by the example of the three twins *Horatij* and *Curiatij*. But to go about that number is reputed and commonly spoken to be monstrous, and to portend some mishap: but only in *Egypt*, where women are more than ordinary fruitfull, by drinking of *Nilus* water, which is supposed to help generation. Of late yeares, and no longer since than in the later end of the reigne of *Aug. Cesar*, at *Ostia* there was a woman (a Commoners wife) deliuered at one birth of two boies & as many girles; but this was a most prodigious token, and portended no doubt the famine that ensued soone after. In *Peloponnesus* there is found one woman that brought forth at foure births 16 Children, and the greater part of them all did well and liued. *Trogus* saith, that in *Egypt* it is an ordinarie thing for a woman to haue seven at a birth. It falleth out moreouer, that there come into the world children of both sexes, whom wee call *Hermaphrodites*. In old time they were knowne by the name of *Androgyni*, and reputed then for prodigious wonders, howsoeuer now men take delight and pleasure in them. *Pompey* the great, in his Theatre which hee adorned and beautified with singular ornaments and rare deuices of antique worke, as wel for the admirable subiect and argument thereof, as the most curious and exquisite hand of cunning and skillfull artificers, among other images and pourtraicts there set vp, represented one *Eutiche* a Woman of *Tralesis*, who after she had in her life time borne thirty births, her corps was caried out by twenty of her children to the funerall fire to be burnt, according to the manner of that countrey. As for *Alcipe* she was deliuered of an Elephant, marie that was a monstrous and prodigious token, and foreshewed some heauy fortune that followed after. Also in the beginning of the *Marians* war there was a bondwoman brought forth a Serpent. In sum, there be many misshapen monsters come that way into the world, of diuers and sundry formes. *Claudius Cesar* writeth, That in *Thessalie* there was borne a monster called an *Hippocentaure*, that is, halfe a man

a man and halfe a horse, but it died the very same day. And verily after he came to weare the diadem, we our selues saw the like monster sent vnto him out of Egypt, embalmed and preferred in honey. Among many strange examples appearing vpon record in Chronicles, we reade of a childe in Sagunt, the same yeare that it was forced and rased by *Anabal*, which so loone as it was come forth of the mothers wombe presently returned into it againe.

CHAP. IIIII.

¶ Of the change of one Sex to another, and of Twins borne.

IT is no lie nor fable, that females may turne to be males: for we haue found it recorded, that in the yearely Chronicles called *Annals*, in the yeare when *Publius Licinius Crassus*, and *C. Cassius Longinus* were Consuls, there was in Cassinum a maid childe, vnder the very hand and tuition of her parents, without suspicion of being a changeling became a boy: and by an Ordinance of the Soothsayers called *Aruuspices*, was confined to a certain desert Island, and thither conveyed. *Licinius Mutianus* reporteth, that he himselfe saw at Argos one named *Arescus*, who before time had to name *Arescusa*, and a married wife: but afterwards in processe of time came to haue a beard, and the generall parts testifying a man, and thereupon wedded a wife. Likewise (as he saith) he saw at Smyrna a boy changed into a girle. I my selfe am an eye witnesse, That in Africke one *L. Cossicius* a citisen of Tisdruta, turned from a woman to be a man vpon the very marriage day, who liued at the time I wrot this booke. Moreouer, it is obserued, that if women bring twins, it is great good hap if they all liue, but either the mother dieth in childbed, or one of the babes, if not both. But if it fortune that the twinnes be of both sexes, the one male, the other female, it is ten to one if they both escape. Moreouer this is well knowne, that as women age sooner than men, and seeme old, so they grow to their maturitie more timely than men, and are apt from procreation before them. Last of all, when a woman goeth with childe, if it bee a man childe, it stirreth ofner in the wombe, and lieth commonly more to the right side: whereas the female moueth more seldom, and beareth to the left.

CHAP. V.

¶ The Generation of Man, the time of childe-birth from seuen moneths to eleuen, testified by many notable examples out of historie.

All other creatures haue a set time limited by Nature, both of going with their yong, and also of bringing it forth, each one according to their kinde: Man only is borne all times of the yeare, and there is no certaine time of his abode in the wombe after conception; for one commeth into the world at the seuen moneths end, another at the eighth, and so to the beginning of the ninth and tenth. But before the seuenth moneth there is no infant euer borne that liueth. And none are borne at seuen moneths end, vnlesse they were conceived either in the very change of the moone, or within a day of it vnder or ouer. An ordinary thing it is in Egypt for women to go with yong eight moneths, and then to be deliuered. And euen in Italy also now adaies children so borne liue and dowell; but this is against the common receiued opinion of all old writers. But there is no certainty to ground vpon in all these cases, for they alter diuers waies. Dame *Vesilia* (the widow of *C. Herditius*, wife afterward to *Pomponius*, and last of all married to *Orfitus*, all right worshipful citizens, and of most noble houses) had 4 children by her three husbands, to wit *Sempronius*, whom she bare at the seuenth moneth, *Suillius Rufus* at the eleuenth: and seuen moneths also she went with *Carbulo*, yet they liued all, and these two last came both to be Consuls. After all these sons, she bare a daughter, namely *Casonia* (wife to the Emperor *Caius Caligula*) at the eighth moneths end. They that are borne thus in this moneth haue much ado to liue, and are in great danger for forty dayes space: yea, and their mothers are very sickly, and subiect to fall into vntimely trauell all the fourth moneth and the eighth, and if they fall in labor and come before their time they die. *Massurius* writeth, that *L. Papyrius*, the Pretor or Lord chiefe Iustice, when a second heire in remainder made claim, and put in plea for his inheritance of the goods, made an award, and gaue iudgement against him, in the behalfe of an Infant heire, borne after the decease of his father, vpon this, That the mother came in and testified, how she was deliuered of that childe within thirteene moneths

A moneths after the death of the Testator: the reason was, because there is no definite time certaine for women to go with childe.

CHAP. VI.

¶ Of Conceptions: and signes distinguishing the sex in great belied women before they are deliuered.

IF ten dayes after a woman hath had the company of a man shee feelee an extraordinary ache in the head, and perceiue giddinesse in the brain as if all things went round; finde a dazling and mistinesse in the eyes, abhorring and loathing meat, and withall a turning and wambling in the stomacke; it is a signe that she is conceived, and beginneth to breed: if the goe with a boy better coloured will she be all the time, and deliuered with more ease, and by the 40 day she shall feelee a kinde of motion and stirring in her wombe. But contrarie it falleth out in the breeding of a girle, she goeth more heauily with it, and findeth the burthen heauier, her legs and thighes about the share will swell a little. And ninetie dayes it will be before she absolutely perceiueeth any mouing of the infant. But be it male or female shee breeds, they put her to much paine and grieuance when their haire beginneth to bud forth, and euer at the full of the Moone: and euen the very infants after they are borne are most amisse and farthest out of frame about that time. And verily great care must be had of a woman with child all the time she goeth therewith, both in her gate, and in euery thing else that can be named: for if women feed vpon ouer-salt and powdered meat they wil bring forth a child without nailes: and if they hold not their wind in their labor, longer it will be ere they be deliuered, and with more difficultie. Much yawning in the time of trauell is a deadly signe, like as to sneeze presently vpon conception threatneth abortion or a slip.

CHAP. VII.

¶ Of the conception and generation of Man.

IAm abashed much, and very sorry to thinke and consider what a poore and ticklish beginning man hath, the proudest creature of all others, when the smel only of the snuffe of a candle put out is the cause oft times that a woman falls into vntimely trauel. And yet see, these great tyrans, and such as delight only in carnage and bloudshed haue no better original. Thou then that presumest vpon thy bodily strength, thou that standest so much vpon Fortunes fauors, and hast thy hands full of her bountifull gifts, taking thy self not to be a foster-child and nurceling of hers, but a naturall son borne of her owne body: thou I say that buisiest thy head euermore, and settest thy minde vpon conquests and victories: thou that art vpon euerie good successe and pleasant gale of prosperity puffed vp with pride, and takest thy selfe for a god, neuer thinkest that thy life when it was hung vpon so single a thred, with so small a matter might haue miscarried. Nay more than that, euen at this day art thou in more danger than so, if thou chance to be but stung or bitten with the little tooth of a Serpent; or if but the verie kernell of a raisin go downe thy throat wrong, as it did with the poet *Anacreon*, which cost him his life. Or, as *Fabius* a Senator of Rome, and Lord chiefe Iustice besides, who in a draught of milk forsuned to swallow a small haire, which strangled him. Well then, thinke better of this point, for he verily that will euermore set before his eyes and remember the frailty of mans estate, shall liue in this world vprightly and in euen ballance, without inclining more to one side than vnto another.

CHAP. VIII.

¶ Of those that be called Agrippæ.

TO be borne with the feet forward is vnnaturall and vnkinde: and such as come in that order into the world the Latines were wont to name *Agrippæ*, as if a man should say, borne hardly and with much ado. And in this maner *M. Agrippa* (as they say) came forth of his mothers wombe, the only man almost known to haue brought any good fortune with him, and prospered in the world of all that euer were in that sort borne. And yet as happy as hee was,

and how well fouer he chieued in some respects, he was much pained with the gout, and passed all his youth and many a day after in bloody wars, and in danger of a thousand deaths. And hauing escaped all these harmfull perils, vnfortunate he was in all his children, and especially in his two daughters the *Agrippina* both, who brought forth those wicked Imps so pernicious to the whole earth, namely *C. Caligula* and *Domitius Nero*, two Emperours, but two fiery flames to consume and waste all mankind. Moreouer, his infelicitie herein appeared, that he liued so short a time, dying as he did a strong and lusty man, in the 51 yeare of his age, tormented and vexed with the adulteries of his owne wife, oppressed with the heauy and intolerable seruitude that he was in vnder his wifes father. In which regards it seems he paid full deare for the preface of his vntoward birth and natiuitie. Moreouer, *Agrippina* hath left in writing, That her son *Nero* also, late Emperor, who all the time of his reigne was a very enemy to all mankind, was borne with his feet forward. And in truth by the right order and course of Nature, a man is brought into the world with his head first, but is carried forth with his feet foremost.

CHAP. IX.

¶ Births cut out of the wombe.

BVt more fortunate are they a great deale whose birth costeth their mothers life, parting from them by means of incision: like as *Scipio Africanus* the former, who came into the world in that manner; and the first that euer was surnamed *Caesar*, was so called for the like cause. And hereof comes the fore-name also of the *Caesars*. In like sort also was that *Manlius* borne who entred Carthage with an army.

CHAP. X.

¶ Who are Vopiscii.

THe Latines were wont to call him Vopiscus [or rather Opiscus] who being one of two twins, hapned to stay behinde in the wombe the full terme, when as the other miscarried by abortiue and vntimely birth. And in this case there chance right strange accidents, although they fall out very seldome.

CHAP. XI.

¶ Examples of many Infants at one birth.

Few creatures there be besides women, that seeke after the male, and can skill of their companie after they be once conceived with yong: one kind verily or two at the most there is knowne to conceiue double one vpon the other. We find in books written by Physitians, and in their records who haue studied such matters, and gathered obseruations, that there haue passed or bin cast away from a woman at one only slip, 12 distinct children: but when it falleth out that there is some pretty time betwixt two conceptions, both of them may carry their full time, and be borne with life, as appeared in *Hercules* and his brother *Iphiclus*; as also in that harlot who was deliuered of two infants, one like her owne husband, the other resembling the Adulterer: likewise in a Proconnesian bond-seruant, who was in one day gotten with childe by her master, and also by his Bailie or Procurator; and being afterwards deliuered of two children, they bewrayed plainly who were their fathers. Moreouer, there was another who went her full time, euen nine moneths for one childe, but was deliuered of another at the five moneths end. Furthermore in another, who hauing dropped downe one childe at the end of seven moneths, by the end of the ninth came with two twinnes more.ouer and besides it is commonly seen, that children be not alwaies answerable to the parents in euery respect: for of perfect fathers and mothers who haue all their limmes, there are begotten children vnperfect and wanting some members: and contrariwise, parents there are maimed and defectiue in some part, who neuertheless beget children that are found and entire, and with all that they should haue. It is seen also, that infants are at a default of those parts their parents misse: yea and they carry often times certaine markes, moles, blemishes, and skarres of their fathers and mothers,

as

As like as may be. Among the people called Dakes the children visually beare the markes imprinted in their armes, of them from whom they descend, euen to the fourth generation.

CHAP. XII.

¶ Examples of many that haue been very like and resembled one another.

IN the race and family of the *Lepidi* it is said there were three of them (not successiue one after another, but out of order after some intermission) who had euery one of them at their birth a little pannicle or thin skin growing ouer their eye. Some haue bin known to resemble their grandfres, and of two twins one hath bene like the father, the other the mother; but he that was borne a yere after hath bin so like his elder brother, as if he had bin one of the twins. Somewomen there be that bring all their children like to themselves; and others againe as like to their husbands: and some like neither the one nor the other. You shall haue Women bring all their daughters like to their fathers, and contrariwise their sonnes like to themselves. The same is notable, and yet vndoubted true, of one *Nicæus* a famous Wrestler of Constantinople, hauing to his mother a woman begotten in adulterie by an *Æthiopian*, and yet with white skin nothing different from other women of that countrey, was himselfe black, and resembled his grandfire the *Æthiopian* abouesayd. Certes, the cogitations and discourses of the minde make much for these similitudes and resemblances whereof we speake, and so likewise many other accidents and occurrent objects are thought to be very strong and effectual therin, whether they come in sight, hearing, and calling to remembrance; or imaginations only conceived and deeply apprehended in the very act of generation, or the instant of conception. The wandering cogitation also and quicke spirit either of father or mother, flying to and fro all on a sudden from one thing to another at the same time, is supposed to be one cause of this impression, that maketh either the foresaid vniforme likeness, or confusion and varietie. And hereupon it commeth, and no maruell it is, that men are more vnlike one another, than other Creatures: for the nimble motions of the spirit, the quicke thoughts, the agilitie of the minde, the varietie of discourse in our wits, imprinteth diuers formes, and many marks of sundry cogitations: whereas the imaginatiue facultie of other liuing creatures is immouable, & alwaies continueth in one: in all it is alike, and the same still in euery one, which causeth them alwaies to engender like to themselves, each one in their severall kindes. *Artenon* a mean man amongst the Commons, was so like in all points to *Antiochus* King of Syria, that *Laodicea* the Queen, after that *Antiochus* her husband was killed, serued her owne turne by the said *Artenon*, and made him play the part of *Antiochus*, vntill she had by his meanes, as in the Kings person, recommended whom she would, and made ouer the kingdome and crown in succession and reuerfion to whom she thought good. *Vibius* a poore commoner of Rome, and *Publicius* one newly of a bond slaue made a free-man, were both of them so like vnto *Pompey* the Great, that hardly the one could be discerned from the other, so liuely did they represent that good visage of his so full of honestie, so fully expressed they and resembled the singular maiestie of that countenance which appeared in *Pompeius* his forehead. The like cause it was that gaue his father also the syname of *Menogenes*, his Cooke, albeit he was surnamed already *Strabo*, for his squint eyes: but hee would needs beare the name of a defect and infirmitie euen in his bond-seruant, for the loue he had vnto him by reason of his likeness. So was one of the *Scipio's* also surnamed *Scrapius* vpon the like occasion, after the name of one *Serapia*, who was but a base slaue of his, and no better than his swine heard, or dealer in buying and selling of swine. Another *Scipio* after him of the same house came to be surnamed *Salutio*, because a certaine jester of that name was liken vnto him. After the same manner one *Spinter*, a player of the second place or part, and *Pamphilus* another player of the third part, or in the third place, gaue their names to *Lentulus* and *Metellus*, who both were Consuls together in one yeare, for that they resembled them so truly. And certes mee thinkes this fell out very vntowardly, and was but a ridiculous pageant, and a very vnseemly shew vpon a stage, to see both Consuls liuely represented there at once in the persons of these two players. Contrariwise, *Rubrius* the stage player was surnamed *Plancus*, because he was so like to *Plinius* the Orator. Againe, *Burbuleius* and *Menogenes*, both players of Entertuldes, resembled *Curio* the father or the elder, and *Metellala Censorius*, for all he had been Censor that.

P 3

that the one could not shift and anoid the syname of *Burbulcius*, and the other of *Monogenes*. **G** There was in Sicily a certaine fisherman who resembled in all parts *Suria* the Pro-consull, not only in visage and feature of the face, but also in mowing with his mouth when hee spake, in drawing his tongue short, and in his huddle and thicke speech. *Cassius Senerus* that famous orator was reproched for being so like vnto *Mirmillo* a drouer or keeper of kine and oxen. *Toranius* a merchant slaue-seller, sold vnto *M. Antonius* (now one of the two great Triumvirs) two most beautiful and sweet faced boyes, for twins, so likewere they one to the other, albeit the one was borne in Asia, and the other beyond the Alps. But when *Antony* afterwards came to know the same, and that this fraud and couzenage was bewraied and detected by the language & speech of the boyes, he fell into a furious fit of choler, and all to berated the foresaid *Toranius*. And when among other challenges he charged him with the high price he made him pay (for they cost him two hundred Sesterces, as for twins, when they were none such) the wily merchant being his craftmaster answered, That it was the cause why he held them so deare, and sold them at so deare a rate: for (quoth he) it is no maruell at all that twobrethren twins that lay both together in one belly do resemble one the other; but that there should be any found borne as these were in diuers countries, so like in all respects as they, he held it for a most rare and wonderfull thing. This answer of his was deliuered in so good time, and so fitly to the purpose, that *Antonie* the great man, who neuer was well but when he outlawed citifens of Rome, and did confiscat their goods, he I say that erewhile was all enraged and set vpon reuiling and reprochfull termes, was not only appeased, but also contented so with his bargaine, that he prised those two boies as much as any thing else in all his wealth.

CHAP. XIII.

¶ The cause and manner of generation.

Some bodies there be by a secret of nature so disagreeing, that they are vnfit for generation one with another. And yet as barren as they be so coupled together, fruitfull they are enough being ioyned with others. Such were *Augustus* the Emperor and his wife *Linia*. In like manner some men there be as well as women, that can skill of getting and breeding none but daughters: and others there be againe that are good at none but sonnes: and many times it falleth out that folke haue sonnes and daughters both, but they by turnes, this yeare a son, the next yeare a daughter, in order. So [*Cornelia*] the mother of the *Gracchi*, who for twelue childbeds kept this course duly: and *Agrippina*, the wife of *Cesar Germanicus*, for nine, euer changing from the male to the female. Some women are barren all their youth; and others again beare but once in their whole life. Some neuer go their full time with their children; and such women, if peraduenture by helpe of physicke or other good means, and choice keeping, they overcome this infirmitie, bring daughters ordinarily and no other. The Emperor *Augustus* among other singularities that he had by himselfe during his life, saw ere he died the nephew of his neece, that is to say his progenie to the fourth degree of lineall discent: and that was *M. Scyllanus*, who hapned to be borne the same yeare that he departed out of this world. He hauing been Consull, and afterward Lord Gouvernor of Asia, was poysoned by prince *Nero*, to the end that he might thereby attaine to the empire. *Qu. Metellus Macedonicus* left behind him six children, and by them eleuen nephewes: but daughters in law and sons in law, and of all such as called him father, seuen. In the Chronicles of *Augustus Cæsars* acts for his time, we finde vpon record, that in his twelfth Consulship, when *L. Sylla* was his companion and colleague in gouernment, vpon the eleuenth day of Aprill, *C. Crispinus Helarus* a gentleman of Fesute, came with solemne pompe into the Capitoll, attended vpon with his nine children, seuen sons and two daughters; with 27 Nephewes the sonnes of his children, and 29 nephewes more, once remoued, who were his sons nephewes, and twelue Nieces besides that were his childrens daughters, and with all these solemly sacrificed.

CHAP.

CHAP. XIII.

¶ Of the same matter more at large.

A Woman commonly is past childe-bearing after 50 yeares of her age. And for the most part their monthly termes stay at forty. As for men, it is cleare and wel knowne, that king *Masiniissa* when he was about 86 yeres old, begat a son whom he called *Methymathmas*: & *Cato Censorius* that famous Censor begat another vpon the daughter of *Salonius* his vassal, when hee was past 80 yeares of age. And hereof it commeth, that the race which came of his other children were surnamed *Liciniani*, but the off-spring of this last sonne, *Salonini*, from whom *Cato Vticensis* (who slew himselfe at Vtica) is lineally descended. Moreouer, it is not long since, that dame *Cornelia* of the house and lineage of the *Scipio's*, bare vnto *Lu. Saturninus* her husband (who died whiles he was Prouost of the city of Rome) a son named *Volusius Saturninus*, and who afterwards liued to be Consull, who was begotten when his father was 62 yeares old with the better. To conclude, there haue bene amongst meaner persons very many knowne to haue gotten children after fourscore and fise.

CHAP. XV.

¶ Of Womens monethly sicknesse.

C Fall liuing creatures a woman hath a flux of blood euery moneth: and hereupon it is, that in her wombe onely there are found a false conception called *Mola*, a Moone-calf, that is to say, a lump of flesh without shape, without life, and so hard withal, that vneth a knife will enter and pierce it either with edge or point. Howbeit, a kinde of mouing it hath, and staeth the course of her moneths: and sometime after the manner of a childe indeed, it costeth the woman her life: otherwhiles it waxeth in her belly as she groweth, and ageth with her; now and then also it slippeth and falleth from her with a laske and loosenesse of the guts. Such a thing breeds likewise in the bellies of men, vpon the hardnesse of liuer or spleen, which the Physicians call *Scirrhus*, i. an hard wedge and cake vnder their short-ribs. And such an one had *Oppius Cato* a nobleman of Rome, late Pretour. But to come againe to women, hardly can there be found a thing more monstrous than is that flux & course of theirs. For if during the time of their sicknesses, they happen to approach or go ouer a vessel of wine, be it neuer so new, it wil presently soure if they touch any standing corne in the field, it wil wither and come to no good. Also let them in this estate handle graffes, they will die vpon it: the herbes and young buds in a garden if they do but passe by, will catch a blast, and burne away to nothing. Sit they vpon or vnder trees whiles they are in this case, the fruit which hangeth vpon them will fall. Do they but see themselves in a looking glasse, the cleare brightnesse thereof turneth into dimnesse, vpon their very sight. Look they vpon a sword, knife, or any edged tooles, bee it neuer so bright, it waxeth duskyish, so dorth also the liuely hue of yvorie. The very bees in the hie die. Yron & Steele presently take rust, yea, and brasse likewise, with a filthy, strong, and poisoned stink, if they lay but hand thereupon. If dogs chance to taste of womens fleures, they run mad therewith; and if they bite any thing afterwards, they leaue behinde them such a venome, that the wounds are incurable: nay the very clammy slime Bitumen, which at certaine times of the yere floteth and swimmeth vpon the lake of Sodom, called *Asphaltites* in Iury, which otherwise of the owne nature is pliable enough, soft and gentle, and ready to follow what way a man would haue it, cannot be parted and diuided asunder (for by reason of the viscositie, it cleaueth and sticketh like glue, and hangeth all together, & pluck as much as a man will at it) but only by a thred that is stained with this venomous blood: euen the silly Pismires (the least creatures of all others) hath a perceiuaunce & sence of this poison, as they say; for they cast aside & will no more come to that corn, which they haue found by tast to be infected with this poison. This malady, so venomous and hurtful as it is, followeth a woman still euery 30 daies; and at 3 moneths end, if it stay so long, it commeth in great abundance. And as there be some women that haue it oftner than once a month, so there are others again that neuer see ought of it. But such lightly of generation: and the mans seed serueth in stead of a runner to gather it round into a curd: which afterwards in proceffe of time

time quickneth and grows to the form of a body, which is the cause that if women with childe haue this flux of the moneths, their children are not long liued, or else they proue feeble, sickly and full of filthie humours, as *Nigidius* writeth.

CHAP. XVII.

¶ In like manner of births: and infants in the mothers wombe.

THe same *Nigidius* is of opinion, that a womans milke, nource to her owne child & giuing it sucke, will not corrupt and be naught for the babe, if she conceiue againe by the same man to whom she brought the former childe. Also it is held, that in the beginning & end of the foresaid menstruall fleures, a woman is very apt to conceiue. Moreouer, it is commonly receiued for an infallible argument in women, that they are fruitfull and with childe, if when they annoint their eies with their owne spittle as with a medicine, the same appeare infected and to change the colour thereupon. Furthermore, doubtlesse it is, that childre n breed their fore teeth in the seuenth moneth after they are borne, and first those in the vpper chaw, for the most part: likewise that they shed the same teeth about the seuenth yere of their age, & others come vp new in the place. Certaine it is also, that some children are borne into the world with teeth, as *M. Curius*, who thereupon was surnamed *Dentatus*, and *Cn. Papyrius Carbo*, both of them very great men and right honourable personages. In women the same was counted but an vn-lucky thing, & prelaged some misfortune, especially in the daies of the KK. regiment in Rome: for when *Valeria* was borne toothed, the wizards and Soothsayers being consulted thereabout, answered out of their learning by way of Prophecie, That look into what citie she was caried to nource, she should be the cause of the ruine and subuersion thereof; whereupon had away shee was and conuicied to *Suessa Pometia*, a city at that time most flourishing in wealth and riches: and it proued most true in the end, for that city was vtterly destroyed. *Cornelia* the mother of the *Gracchi* is sufficient to proue by her own example, that women are neuer borne for good whose genitall parts for procreation are growne together, and yeeld no entrance. Some children are borne with an entire whole bone that taketh vp all the gum, instead of a row of distinct teeth, as a son of *Prusias* king of the Bythinians, who had such a bone in his vpper chaw. This is to be obserued about teeth, that they onely check the fire and burn not to ashes with other parts of the body: and yet as inuincible as they are and able to resist the violence of the flame, they rot and become hollow with a little catarhe or waterish rheume that droppeth and distilleth vpon them: while they may be made, with certaine mixtures and medicines called *Dentifices*. Some weare their teeth to the very stumps onely with vse of chawing; others againe loofe them first out of their head; they serue not onely to grind our meat for our daily food and nourishment, but necessary also they be for the framing of our speech. The fore-teeth stand in good stead to rule and moderate the voice by a certaine consent and tuncable accord, answering as it were to the stroke of the tongue: and according to that row and ranke of theirs wherein they are set, as they are broader or narrower, greater or smaller, they yeeld a distinction and varietie in our words, cutting and hewing them thicke and short, framing them pleasant, plaine, and ready, drawing them out at length, or smuddering and drowning them in the end: but when they bee once false out of the head, man is bereaued of all means of good vtterance and explanation of his words. Moreouer, there are some prelagages of good or bad fortune, gathered by the teeth: men ordinarily haue giuen them by nature 32 in all, except the nation of the *Turduli*. They that haue about this number, may make account (as it is thought) to liue the longer. As for women, they haue not so many: they that haue on the right side in the vpper iaw two eie-teeth, which the Latines call Dogs-teeth, may promise themselves the flattering fauours of Fortune, as it is well seene in *Agrippina* the mother of *Domitius Nero*: but contrariwise, the same teeth double in the left side about, is a signe of euill lucke. It is not the custome in any countrey to burne in a funeral fire the dead corps of any infant before his teeth be come vp; but hereof will we write more at large in the Anatomie of man, when wee shall discourse purposely of euerie member and part of the body. *Zoroastres* was the onely man that euer wee could heare of, who laughed the same day that he was borne: his brain did so euidently pant and beat, that it would beare vp their hands that laid them vpon his head: a most certain prelage & fore-token of that great learning that afterward, he attained vnto. This also is held for certain and resolued vpon that a man at three yeares of age, is come to one moitie of his growth and height. As also this

A is obserued for an vndoubted truth, that generally all men come short of the full stature in time past, and decrease still euery day more than other: and seldome shall you see the son taller than his father; for the ardent heat of the elementarie fire (whereunto the world enclineth already now toward the later end, as somtimes it stood much vpon the waterie element) deuoureth and consumeth that plentiful humor and moisture of naturall seed, that engendreth all things: and this appeareth more euidently by these examples following. In *Crete*, it chanced that an hill claue asunder in an earth-quake, and in the chink thereof was found a body standing, 46 cubits high; some say it was the body of *Orion*; others, of *Otus*. We find in chronicles & records of good credit, that the body of *Orestes* being taken vp, by direction from the Oracles, was seuen cubits long. And verily that great and famous poet *Homer*, who liued almost 1000 yeres ago, complained and gaue not ouer, That mens bodies were lesse of stature euen then, than in old time. The *Annales* set not downe the stature and bignesse of *Nevius Pollio*; but that he was a mighty gyant, appeareth by this that is written of him, namely, that it was taken for a wonderful strange thing, that in a great rout & presse of people that came running together vpon him, he had like to haue bin killed. The tallest man that hath bin seen in our age, was one named *Gabbara*, who in the daies of prince *Claudius* late Emperour, was brought out of Arabia; nine foot high was hee, and as many inches. There were in the time of *Augustus Caesar* 2 others, named * *Pusio* and *Secundilla*, higher than *Gabbara* by halfe a foot, whose bodies were preserved and kept for a wonder in a charnell house or sepulchre within the gardens of the *Salustians*. Whiles the same *Augustus* sate as president, his niece *Iulia* had a little dwarfish fellow not about 2 foot and a hand bredth high, called *Conopas*, whom she set great store by and made much of: as also another the dwarfe named *Andromeda*, who somtime had been the slaue of *Iulia* the princeesse, and by her made free. *M. Varro* reporteth, that *Manius Maximus*, and *M. Tullius*, were but two cubits high, & yet they gentlemen and knights of Rome: and in truth we our selues haue seen their bodies how they lie embalmed and chested, which testifieth no lesse. It is well knowne that there be some that naturally are neuer but a foot and a halfe high; others again somewhat longer; and to this heighth they came in three yeres, which is the full course of their age, and then they die. Wee reade moreover in the *Chronicles*, that in *Salamis* one *Euthimenes* had a son, who in three yeres grew to be three cubits high, but he was in his gate slow and heauy, and in his wit as dull and blockish; howbeit in his time vndergrowne he was, and his voice changed to be great, and at three yeares end died suddenly of a generall crampe or contraction of all the parts of his body. It is not long since I saw my selfe the like in all respects (sauius that vndergoing aforesaid) in a son of one *Cornelius Tacitus*, a Roman knight, and a procurator or general receiuer and Treasurer for the State in *Gaule Belgique*; such the Greeks call *ἑκταπῆλος*, *i. Ectrapelos*; wee in Latine haue no name for them.

CHAP. XVI.

¶ Certaine notable obseruations in bodies of men and women.

WE see tried by experience, that take measure of a man from the sole of the foot vp to the crowne of the head, so far it is between the ends of his two middle and longest fingers, when he stretcheth out his armes and hands to the full. As also, that some men and women be stronger of the right side than of the left: others againe that be as strong of one as the other; and there be, that are altogether left handed, and best with that hand; but that is seldome or neuer seen in women. Moreouer, men weigh heauier than women; and in euerie kind of creature, dead bodies be more heauy than the quicke: and the same parties sleeping weigh more than waking. Finally, obserued it is, that the dead corps of a man floteth on the water with the face vpward; but contrariwise women swim groueling, as if Nature had prouided to saue their honesty and cower their shame, euen when they are dead.

CHAP. XVIII.

¶ Examples of diuers extraordinarie cases in mans body.

WE haue heard, that some mens bones are folliid and massie, and so do liue without any marrow in them: you may know them by these signes, they neuer feele thirst, nor put forth any sweat; and yet we know that a man may conquer and master his thirst if hee list:

* Ten foot and an halfe.

* Such an one as little John, for so the nick-name signifieth.

lift: for so a gentleman of Rome one *Iulius Viator*, descended from the race of the Vocontians our allies; being false into a kind of dropie between the skin and the flesh during his minority and nonage, and forbidden by the Physicians to drink; so accustomed himselfe to obserue their direction, that naturally he could abide it: in so much, that all his old age euen to his dying day he forbore his drink. Others also haue bin able to command and ouer-rule their nature in many cases, and breake themselves of diuers things.

CHAP. XIX.

¶ Strange natures and properties of diuers persons.

IT is said, that *Craffus* (grandfather to that *Craffus* who was slaine in Parthia) was neuer known to laugh all his life time, and thereupon was called *Agelastus*; and contrariwise, many haue bin found that neuer wept. Also that sage and renowned wise man *Socrates*, was seene alwaies to carry one and the selfe same countenance, neuer more merry and cheerefull nor more solemn and vnquiet, at one time than at another. But this obstinate constancy and firm carriage of the mind, turneth now and then in the end into a certain rigour and austerity of nature, so hard and inflexible that it cannot be ruled, and in very truth despoileth men of all affections; and such are called of the Greekes, *Apathes*, who had the experience of many such: and (that which is a marvellous matter) those especially that were the great pillars of philosophy and deep learned Clerks, namely *Diogenes* the Cinicke; *Pyrrho*, *Heraclitus* and *Timo*; and as for him he was so far gone in his humor, that he seemed professedly to hate all mankind. But these were examples of a corrupt, peruerse, & froward nature. As for other things, there be sundry notable obseruations in many; as in *Antonia* the wife of *Drusus*, who as it was well knowne, neuer spit: in *Pomponius* the poet, one that had sometimes bin Consul, who neuer belched. But as for such as naturally haue their bones not hollow, but whole and solid, they be very rare and seldom seene, and called they are in Latine *Cornei*, i. hard as hornes.

CHAP. XX.

¶ Of bodily strength and swiftnesse.

VARRO in his treatise of prodigious and extraordinary strength, maketh report of one *Tritamnerus*, a man that of body was but little and lean withall, howbeit of incomparable strength, much renowned in the fence schoole, and namely, in handling the Samnites weapons, wearing their manner of armor, and performing their feats and masteries of great name. He maketh mention also of a sonne of his, a souldier, that serued vnder *Pompeius* the Great, who had all ouer his body, yea and throughout his armes and hands, some sinewes running streight out in length, others crossing ouerthwart lattise-wise; and he faith moreouer of him, that when an enemy out of the camp gaue him defiance and challenged him to a combat, he would neither put on defensiuie harness, ne yet arme his right hand with offensive weapon; but with naked hand made meanes to foile and overcome him, and in the end when hee had caught hold of him, brought him away perforce into his own camp with one finger. *Iunius Valens* a capitaine, pensioner or centurion of the gard-souldiers about *Augustus Caesar*, was wont alone to beare vp a charriot laden with certain hogheads or a butt of wine, vntill it was discharged thereof, & the wine drawne out: also his manner was with one hand to stay a coach against all the force of the horses straining and straining to the contrary; and to perform other wonderful masteries, which are to be seen engrauen vpon his tombe; and therefore (qd. *Varro*) being called *Hercules Rusticellus*, he tooke vp his mule vpon his back and carried him away. *Fufius Saluius* hauing two hundred pound weights at his feet, and as many in his hands, and twise as much vpon his shoulders, went withall vp a paire of staires or a ladder. My selfe haue seene one named *Athanasius*, do wonderfull strange matters in the open shew and face of the world, namely, to walke his stations vpon the stage with a cuirace of lead weighing 500 pound, booted besides with a pair of buskins or greiues about his legges that came to as much in weight. As for *Milo* the great wrestler of Crotona, when he stood firm vpon his feet, there was not a man could make him stir one foot; if he held a pomegranat fast within his hand, no man was able to stretch a finger of his and force it out at length. It was counted a great matter, that *Philippides* ran 1140 stadia, to wit,

A wit, from Athens to Lacedæmon in two daies, vntill *Lanis* a courtier of Lacedæmon, and *Philonides* footman to *Alexander* the great, ran between Sicyone and Olis in one day, 1200 stadia. But now verily at this day we see some in the grand cirque, able to indure in one day the running of 160 miles. And but a while agoe we are not ignorant, that when *Foncius* & *Pipianus* were Consuls, a yong boy but 9 yeres old, between noon and euening ran 75 miles. And verily a man may wonder the more at this matter, and come to the full conceit thereof, if he do but consider, that it was counted an exceeding great iourney that *Tiberius Nero* made with three chariots (shifting from one to the other fresh) in a day and a night, riding post haste vnto his brother *Drusus* then lying sicke in Germany, and all that was but 200 miles.

CHAP. XXI.

¶ Examples of good Eie-sight.

WE find in histories as incredible examples as any be, as touching quicknesse of Eie-sight: *Cicero* hath recorded, that the whole Poeme of *Homer* called *Ilias*, was written in a piece of parchment, which was able to be couched within a nut shel. The same writer maketh mention of one that could see and discern out-right 135 miles. And *M. Varro* nameth the man, and faith he was called *Strabo*, who affirmeth thus much moreouer of him, that during the Carthaginian war he was wont to stand and watch vpon *Lilybæum*, a cape in Sicily, to discouer the enemies fleet loosing out of the haven of Carthage, and was able to tel the very just number of the ships. *Callicrates* vsed to make Pismires and other such like little creatures, out of yvorie so artificially, that other men could not discern the parts of their body one from another. There was one *Myrmecides*, excellent in that kinde of workmanship: who of the same matter wrought a chariot with foure wheelles and as many steedes, in so little roome, that a silly flie might couer all with her wings. Also he made a ship with all the tackling to it, no bigger than a little bee might hide it with her wings.

CHAP. XXII.

¶ Of Hearing.

AS for hearing, there is one example wonderfull. For the bruit of that battell, whereupon *Sybaris* was forced & sacked, was heard the very same day as far as *Olympia* [in Greece.] As touching the news of the Cimbrians defeate, as also the report and tidings of the victorie ouer the Persians, made by the Roman Castores, the same day that it was achieued, were held for diuine reuelations rather than humane reports, and the knowledge thereof came more by way of vision than otherwise.

CHAP. XXIII.

¶ Examples of Patience.

MANY are the calamities of this life, incident to mankind, which haue afforded infinite trials of mens patience, in suffering paines in their body. Among others, for women, the example of *Leena* the courtisan, is most rare and singular, who for all the dolorous tortures that could be deuised, would neuer bewray *Harmodius* and *Aristogiton*, who slew the tyrannous king. And for men, *Anaxarchus* did the like, who being for such a cause examined vpon the racke, in the midst of his torments bit off his own tongue with his teeth, the only means whereby he might haply reueale and disclose the matter in question, and spit it in the face of the tyrant that put him to his torture.

CHAP. XXIII.

¶ Examples of Memorie.

AS touching memorie, the greatest gift of Nature, and most necessary of all others for this life, hard it is to iudge and say who of all others deferred the chiefe honor therein: considering how many men haue excelled, and woon much glory in that behalfe. King *Cyrus* was

CHAP. XXVI.

¶ The commendation of Pompey the great.

AS concerning all the titles and victorious triumphs of Pompey the great, wherein hee was equall in renowne and glory, not onely to the acts of Alexander the great, but also of Hercules in a manner, and god Bacchus: if I should make mention thereof in this place, it would redound not to the honour onely of that one man, but also to the grandeur and Maieftie of the Roman empire. In the first place then, after he had recovered Sicily, and reduced it vnder obedience (where his first rising was, and where hee began to shew himselfe in the quarrell of the Common weale, and to side with Sylla) hauing also conquered and subdued Africke, and raunged it vnder the obedience of Rome, where he acquired the surname of Magnus, by reason of the great booty and pillage which he brought from thence; being no higher of birth and calling, than a Roman gentleman or man of armes, entred with triumphant chariot into Rome: a thing that was neuer scene before in a man of that place and qualitie. Immediately after this, he made a voyage into the West, and hauing brought vnder obedience of the Romans 876 great townes, which he forced by assault betwene the Alpes and the marches of Spaine, he erected trophies and triumphant columnes vpon the mountain Pyrenæus, with the title and inscription of these victorious exploits, and neuer made one word of his victorie ouer Sertorius, so braue a mind he carried with him. And after the ciuill troubles and broiles appeased & quenched (which drew after them all forreine wars) he triumphed againe the second time, being as yet but a knight of Rome: so oftentimes a generall of command & conduct, before he euer serued as soldier in the field. These famous deeds atchieued, sent out he was in another expedition, to scoure & cleere all the seas, and so forward into the East parts. From whence he returned with more titles still of honor to his country, after the manner of those that winne victories at the solemne festiuall * Games; for as the victors vse not themselves to accept the chaplets and guirlands in their own names, but to be crowned therewith in the behalf of their native countries; euen so, Pompeius, in that temple which he caused to be built of the bootie and pillage woon from the enemies, and dedicated to * Minerva, entituled the citie with the whole honour, and attributed all to them in an inscription or table engrauen in this manner: Pompeius the Great, Lord Generall, hauing finished the warres which continued thirtie yeares, during which he had discomfited, put to flight, slaine, or receiued to mercie vpon submission 2183000 men: sunke or taken 846 saile, woon and brought to his deuotion, of cities, townes and castles, to the number of 1538: subdued and put vnder subiection all lands and Nations betwene the lake Maotis and the red sea, hath dedicated of right and good desert this temple to Minerva. This is the brieue and summarie of his seruice in the East. As for the triumph, wherein he rode the third day before the Calends of October, in the yeare wherein M. Messala and M. Piso were Consuls, the tenure and title ran in this form: Whereas Cn. Pompeius hath cleared all the sea coasts from Pyrats and rourers, and thereby recovered vnto the people of Rome the lordship and soueraignetic of the seas; and withall subdued Pontus, Armenia, Paphlagonia, Cappadocia, Cilicia, Syria, the Scythians, Iudæa, and the Albanois: the Island Creta, and the Bastarnians, hath triumphed ouer them all, as also for the vanquishing of the 2 kings Mithridates and Tigranes. But the greatest glorie of all glories in him was this (as himselfe deliuered openly in a full assembly, at what time as he discoursed of his owne exploits) That whereas Asia when he receiued it, was the vtmost frontier prouince and limit of the Roman Empire, hee left the same in the very heart & mids thereof, and so deliuered it vp to his country. Now if a man would set Caesar on the other side against him, & likewise rehearse his noble acts, who indeede of the two seemed greater in the sight of the world, he had need verily to fetch a circuit about the world, and comprehend the whole globe thereof, which were an infinit piece of work, and in all reason impossible.

CHAP. XXVII.

¶ The praise of Cato, the first of that name.

IN sundry other kindes of vertues many men haue diuersly excelled. But Cato, the first of the Porcian house, was thought to be the only person who was able to perform three things in the highest degree that are most commendable in a man. For first and formost he was a singular good

Olympia Nemæa, Pythia, Isthmia.

* Or Victorie.

was able to call euery souldier that he had through his whole army by his owne name. L. Scipio could do the like by all the citizens of Rome. Semblably, Cincas, Embassador of king Pyrrhus, the very next day that he came to Rome, both knew and also saluted by name all the Senate, & the whole degrees of Gentlemen and Caualerie in the citie. Mithridates the king, reigned ouer two and twentie nations of diuers languages, and in so many tongues gaue lawes and ministred justice vnto them, without truchman: and when he was to make speech vnto them in publicke assembly respectiue to euery nation, he did performe it in their own tongue without interpreter. One Charmidas or Charmadas, a Grecian, was of so singular a memory, that he was able to deliuer by heart the contents word for word of all the books that a man could call for out of any librarie, as if he read the same presently within book. At length the practise hereof was reduced into an art of Memory: deuised and inuented first by Simonides Melicus, and afterwards brought to perfection and consummate by Metrodorus Sepsus, by which a man might learne to rehearse againe the same words of any discourse whatsoeuer after once hearing: and yet there is not a thing in man so fraile and brittle againe as it, whether it be occasioned by discafe, by casual injuries or occurrents, or by feare, through which it faileth somtime in part, and otherwhiles decayeth generally, and is clean lost. One with the stroke of a stone, fell presently to forget his letters onely, and could reade no more; otherwise his memorie serued him well enough. Another with a fall from the rooffe of a very high house, lost the remembrance of his owne mother, his next kinsfolks, friends, and neighbors. Another in a sicknesse of his, forgot his own seruants about him: and Messala Corvinus the great Orator, vpon the like occasion, forgot his own proper name. So fickle and slipperie is mans memorie: that oftentimes it assaieth and goeth about to leese it selfe, euen whiles a mans body is otherwise quiet and in health. But let sleep creepe at any time vpon vs, it seemeth to be vanquished, so as our poore spirit wandreth vp and downe to seeke where it is, and to recouer it againe.

CHAP. XXV.

¶ The praise of C. Iulius Caesar.

FOR vigor and quicknesse of spirit, I take it, that C. Caesar Dictatour, went beyond all men besides. I speake not now of his vertue and constancie, neither of his high reach and deep wit, whereby he apprehended the knowledge of all things vnder the cope of heauen; but of that agilitie of minde, that prompt and ready conceit of his, as nimble and actiue as the verie fire. I haue heard it reported of him, that he was wont to write, to reade, to indite letters, and withall to giue audience to suiters & heare their causes all at one instant. And being employed, as you know he was, in so great and important affairs, he ordinarily indited letters to foure secretaries or clerkes at once: and when he was free from other greater businesse, he would otherwise finde feuen of them work at one time. The same man in his daies fought 50 set battels with banners displayed against his enemies: in which point, he alone out-went M. Marcellus, who was scene 40 times saue one in the field. Besides the carnage of citizens that hee made in the ciuill wars when he obtained victory, he put to the sword 1192000 of his enemies, in one battell or other. And certes for mine owne part, I hold this for no speciall glory and commendation of his, considering so great iniurie done to mankind by this effusion of blood, which in some part he hath confessed himselfe, in that he hath forborne to set downe the ouerthrowes & blood-shed of his aduersaries (fellow citizens) during the ciuill wars. Yet Pompey the great deserues honour more iustly for scouring the seas, and taking from the rourers 846 saile of ships. But to returne againe to Caesar, ouer and aboue the qualities of worth before rehearsed, an especiall property of his owne he had for clemency and mercy, wherein he so far forth furmounted all other men, that hee repented thereof in the end. As for his magnanimity, it was incomparable, and he left such a presient behind him, as I forbid all men to match or second it. For to speake of his sumptuosities, of his largesses, of the magnificent shewes exhibited to the people, the exceeding cost & charges therein bestowed, with all the stately furniture thereto belonging, were a point of him that fauored such lauish expence and superfluities. But herein appeared his true hauintesse of mind indeed, and that vnmatchable spirit of his, that when vpon the battell at Pharalia, as wel the cofers & caskets with letters & other writings of Pompey, as also those of Scipio's before Thapsus, came into his hands, he was most true to them, and burnt all without reading one scrip or scrol.

CHAP.

Carnader, according to Cincero and Quintilian.

good Oratour: see only, a most braue captaine and renowned commander in the field: and last of all, a right worthy Senatour and approued counsellor. And yet in my conceit, all these excellent parts seeme to haue shined more bright (although he came after the other) in *Scipio Aemilianus*. To say nothing of this blessed gift besides, that he was not hated and spighted of so many men, as *Cato* was. But if you will seeke for one especiall thing in *Cato* by himselfe, this is reported of him, That he was judicially called to his answer 44 times, and neuer was there man accused oftner than he, yet went he euer cleare away and was acquit.

CHAP. XXVIII.

¶ Of Valour and Fortitude.

AN endlessse peece of worke it were to know and set downe who bare the prize for valiancy, & namely if we admit the fabulous tales of poets. As for the poet *Ennius*, he had in greatest admiration, *T. Caecilius Tenuer*, and especially his brother: and in regard of those two, he compiled the sixt booke of his *Annales* to the rest. But *L. Sicius Dentatus*, a Tribune of the Commons, not long after the banishment of the kings, when *Sp. Tarpeius* and *A. Asterius* were Consuls, by most voices surpasse in this kind, if it be true that a number of men report of him: namely, that he serued in 120 foughten fields: 8 times maintained combat with his enemy, giuing defiance, and euermore got the vpper hand: carrying before him the glorious markes of 45 skarres receiued by wounds, and neuer a one in the backe parts of his body. Moreouer, he woon the spoile of 34 feuerall enemies: and had giuen him of his captains, for his prowesse and good seruice, 18 headlesse speares, 25 caparisons and furnitures of great horses, 83 chains, 160 bracelets for to adorne his arms: 26 crowns, or triumphant chaplets, whereof 14 were ciuicke, for rescuing of Roman citizens in jeopardy of death, 8 of beaten gold, 3 other mural, for mounting first ouer the enemies wall: and last of all, one obsidionall, for enforcing the enemy to leue and breake vp his siege and depart; also with a stipend or pension, fee out of the Exchequer & chamber of the city; and lastly, the prise or ransom of ten prisoners, with 20 oxen besides to make vp the reward; and in this glorious pompe and shew he followed nine captain Generals going before him, who by his means triumphed all. Ouer and besides (which I suppose was the worthiest act that euer he did) he accused in open court before the body of the people, one commander and great captaine, named *T. Romulus* (notwithstanding he had bin a Consul) and conuicted him for his ill management and conduct of the wars. As for *Manlius Capitolinus*, he was as many honourable testimonies of valour, but that he lost them all againe, with that vnhappy end of his life that he made. Before he was full 17 yeres of age, hee had gained already two complete spoiles of his enemies. He was the first Roman knight or man of armes, that was honored with a mural crowne of gold for scaling ouer the wall in an assault; with six ciuicke chaplets for sauing the life of citizens six times out of the enemies hands. Moreouer, he receiued 37 gifts of the people for his good seruice, and carried the skarres in the fore-part of his body of 33 wounds. He rescued *P. Seruilius*, Generall of the Roman Cauallerie, & in the rescue was himselfe wounded for his labor, in shoulder and thigh both. Aboue all other hardy acts, he alone guarded and defended the Capitoll, and thereby the whole State of Rome, against the Gauls: a braue peece of seruice, but that he marred all againe in aspiring to be king ouer the same. In these aboue rehearsed examples, certes vertue hath carried a great stroke, but yet fortune hath been the mightier, and preuailed more in the end. And in my iudgement verily, none may right & iustly prefer any man before *M. Sergius*; albeit *Catiline* his nephewes son diseredited that name of his, & derogated much from the honor of his house. The second time that he went into the field and serued, his had was to lose his right hand: and in two other seruices hee was wounded no fewer than 23 times: by meanes whereof hee had little vse of either hand, and his feet stood him in no great stead. Howbeit, thus maimed and disabled as hee was for to be a souldiour, hee went many a time after to the warres, attended with one slaue onely, and performed his deuoir. **M**Twife was he taken prisoner by *Annibal* (for he dealt not I may tell you with ordinary enemies) and twife brake he prison and made escape, notwithstanding, that for twentie moneths space he was euery day ordinarily kept bound with chaines and fetters. Four times fought hee with his left hand onely, vntill two horses one after another, were killed vnder him. Then hee made himselfe a right hand of yron, which he fastened to his arme, and fighting with the help of it, he raised

A raised the siege from before *Cremona*, and saued *Placentia*. In France he forced 12 fortified camps of the enemies. All which exploits appeare vpon record in that Oration of his which he made in his Pretorship, at what time as his Colleagues and companions in gouernement would not permit him to be at the solenne sacrifices, because he had a maim, and wanted a lim. But what heaps of crowns and chaplets, thinke you, would he haue gathered together, if he had bin committed and matched with any other enemies but *Annibal*: Certes, to know a man of worth indeed, much materiall it is to consider in what time hee liueth, and is imploied, for the prooffe of his valour. For what store of ciuicke coronets and garlands, yeelded either the battell of *Trebia* and *Ticinus*, or of *Thrasymenus* the lake? What crowne could haue bin gained and woon at the iourney of *Cannæ*, where the best seruice was by good footmanship to flie & run away? To conclude, all others may vaunt verily, that they haue vanquished men; but *Sergius* may boast, that he hath conquered and ouercome euen Fortune her selfe.

CHAP. XXIX.

¶ The commendation of some men for their quicke wits.

WHo is able to make a muster as it were of them that haue been excellent in wit: so difficult a matter it is to run through so many kinds of sciences, and to take a suruey of curious handi-works in such varietie, of most rare and singular artifices? Vnlesse haply we agree vpon this, and say, that *Homer* the Greeke poet excelled all other, considering either the subiect matter, or the happy fortune of his worke. And hereupon it was, that *Alexander* the Great (for in this so proud a censure and comparison, I shal do best to cite the iudgment of the highest, and of those that be not subiect to enuie) hauing found among the spoils of *Darius* the king, his persumier or casket of sweet ointments, and the same richly imbellished with gold and costly pearls and precious stones, when his friends about him shewed him many vses whereto the said coffer or cabinet might be put vnto, considering that *Alexander* himselfe could not away with those delicate perfumes, being a warriour, and slurred with bearing armes, and following warfare: when, I say, his gallants about him could not resolute well what seruice to put it to: himselfe made no more ado but said thus, I will haue it to serue for a case of *Homers* bookes: judging hereby, that the most rare and precious worke proceeding from that so admirable a wit of man, should be bestowed and kept in the richest box and casket of all others: the same prince, in the forcing and sackage of the citie of *Thebes*, caused by expresse commandement, That the dwelling house & whole family of *Pindarus* the Poet should be spared. He built againe the natiue city wherein *Aristotle* the Philosopher was borne: and in so glorious a shew of his other worthy deeds, would needs intermingle this testimony of his bounty, in regard of that rare clerke who gaue light to all things in the world. The murderers of *Archilochus* the poet, the very Oracle of *Apollo* at *Delphi* disclosed and reuealed. When *Sophocles* the prince of all tragicall Poets was dead in Athens, at what time as the citie was besieged by the *Lacedæmonians*, god *Bacchus* appeared sundry times by way of vision in a dreame to *Lysander* their king, admonishing him to suffer his delight, and him whom he set most store by, for to be entered. **E** Whereupon the king made diligent enquire who lately was departed this life in Athens: and by relation of the citizens soone found it out and perceiued who it was that the foresaid god meant, and so gaue them leaue to bury *Sophocles* in peace, and to performe his funeralls without any molestation or impeachment.

CHAP. XXX.

¶ Of Plato, Ennius, Virgil, M. Varro, and M. Cicero.

Denis the tyrant, borne otherwise to pride and cruelty, being aduertised of the coming and arriual of *Plato*, that great clerke and prince of learning, sent out to meet him a ship adorned with goodly ribbands, and himselfe mounted vpon a charriot drawne with four white horses, receiued him as if he had bin a King, at the haue, when hee dis barked and came aland. *Isocrates* sold one Oration that he made for 20 talents of gold. *Aeschines* that famous orator of Athens in his time, hauing at *Rhodes* rehearsed that accusatorie oration which he had made

made against *Demosthenes*, read withall his aduersaries defence againe, by occasion whereof he was confined to Rhodes, and there liued in banishment: and when the Rhodians that heard it wondred thereat, Nay (qd. *Aeschines*) you would haue marvelled much more at it, if you had heard the man himselfe pronouncing it, & pleading *Vina voce*: yeelding thus as you see a notable testimony of his aduersary, in the time of his aduersitie. The Athenians exiled *Thucydides* their Generall Captaine: but after he had written his Chronicle, they called him home again, wondering at the eloquence of the man, whose vertue and prowesse they had before condemned. The KK. of Egypt and Macedonie gaue a singular testimony how much they honoured *Menander* the Comical poet, in that they sent Embassadors for him, and a fleet to waite him for his more securitie: but he wane unto himselfe more fame and glory by his owne settled iudgement, for that he esteemed more of his owne priuat study and following his book, than of all those fauors offered vnto him from great princes. Moreover, there haue bin great personages and men of high calling at Rome, who haue shewed the like in token, how they esteemed and regarded the learned crew of forrein nations. *Cn. Pompeius*, after he had dispatched the war against *Mithridates*, intended to go and visit *Posidonius*, that renowned professor of learning; and when hee should enter into the mans house, gaue streight commandement to his Liſtors or Huiſhers, that they should not (after their ordinary maner with all others) rſp at his dore; and this great warriour, vnto whom both the East and West parts of the world had submitted, vailed boner, as it were, and bafed his armes and ensignes of state which his officers carried, before the veric dore of this Philosopher. *Cato*, surnamed *Censorius*, vpon a time when there came to Rome that noble embassage from Athens, consisting of three, the wisest sages among them; when hee had heard *Carnedes* speake (who was one of those three) gaue his opinion presently, That those embassadors were to be dispatched and sent away with all speed; for feare least if that man argued the case, it would be an hard piece of worke to found and find out the truth, so pregnant were his reasons, and so witty his discourses. But Lord! what a change is there now in mens manners and dispositions! This *Cato*, the renowned Censor, both now and at all times else, could not abide to haue any Grecian within Italy, but alwaies gaue iudgement to them all in generall to be expelled: but after him there comes his nephew once remoued, or his nephewes sonne, who brought one of their Philosophers ouer with him, when he had bin military Tribune or knight marſhall: and another likewise vpon his embassage to Cypres. And verily a wonder it is and a memorable thing to consider how these two *Catoes* differed in another point: for the former of them could not away with the Greek tongue, the other that killed himselfe at *Vtica*, esteemed it as highly. But to leaue strangers, let vs now speak of our own countymen, so renowned in this behalfe. *Scipio Africanus* the elder, gaue expresse order, and commanded, That the statue of *Ennius* the poet should be set ouer his tomb, to the end, that the great name and stile of *Africanus*, or indeed the booty rather that hee had woun and carried away from a third part of the world, should in his monument vpon the reliques of his ashes be read together with the title of this poet. *Augustus Caesar* late Emperor, expressely forbad that the Poeme of *Virgil* should be burned, notwithstanding that he by his last wil and testament on a modesty, gaue order to the contrary: by which means there grew more credit and authority vnto the Poet, than if himselfe had approued and allowed his owne verses. *Asinius Pollio* was the first that set vp a publicke Library at Rome, raised of the spoile and pillage gained from the enemies. In the Library of which gentleman, was erected the image of *M. Varro*, euen whiles he liued: a thing that won as great honor to *M. Varro* in mine opinion (considering that amongst those fine wits, whereof a great number then flourished at Rome, his hap only was to haue the garland at the hands of a noble citizen and an excellent Orator beside:) as that other nauall crowne gained him, which *Pompey* the Great bestowed vpon him for his good seruice in the pyrats war. Infinite examples more there are of vs Romans, if a man would seeke after them and search them out: for this only nation hath brought forth more excellent and accomplished men in euery kinde, than all the lands besides of the whole world. But what a sin should I commit, if I proceeded farther and speake not of thee, O *M. Cicero*? and yet how should I possibly write of thee according to thy worthinesse: would a man require a better prooffe of thy condigne praises, than the most honorable testimony of the whole body of that people in generall, and the acts onely of thy Consulship, chosen out of al other vertuous deeds throughout thy whole life? Thine eloquence was the cause that all the Tribes renounced the law *Agraria*, as touching the diuision of Lands among

A among the commons, albeit their greatest maintenance and nourishment consisted therein. Through thy persuation they pardoned *Roscius*, the first author of that seditious bill and law, whereby the States and degrees of the city were placed distinctly in their seats at the Theatre: they were content I say, and tooke it well, that they were noted and pointed at for this difference in taking place and rowms, which he first brought in. By means of thy orations, the children of proscrip and outlawed persons were ashamed and abashed to sue for honorable dignities in common-weale: thy witty head it was that put *Catiline* to flight, and banished him the city: thou, and none but thou didst out-law *M. Antonius*, and put him out of the protection of the State. All haile therefore, O *M. Tullius*, faire chieue thee, thou that first was saluted by the name of *Parens patrie*, i. Father of thy countrey: first that deserued triumph in thy long robe, & the laurel garland, for thy language: the only father indeed of eloquence & of the Latin tongue: and (as *Caesar* Dictator sometime thine enemy hath written of thee) hast deserued a crown aboue all other triumphs, by how much more praise-worthy it is, to haue amplified and set out the bounds and limits of Roman wit and learning, than of Roman ground and dominion.

CHAP. XXXI.

¶ Of a certaine Maiesſtie in behaiour and cariage.

T hose, who among other gifts of the minde haue surpassed other men in sage aduise and wisdom, were thereupon at Rome surnamed *Cati*, and *Corculi*. In Greece, *Socrates* carried the name away from all the rest, being deemed by the Oracle of *Apollo Pythius*, the wisest man of all others.

CHAP. XXXII.

¶ Of Authoritie.

A gaine, *Chilo* the Lacedemonian was of so great reputation among men, that his sayings were held for Oracles; and three precepts of his were written in letters of gold, & consecrated in the temple of *Apollo* at Delphi: where the first was this, *Know thy selfe*: the second, *Set thy minde too much on nothing*. The third, *Debt and Law are alwaies accompanied with misery*. His hap was to die for ioy, vpon tidings that his son wan the best prize, and was crowned victour at the solemne game Olympia; and when he should be interred, all Greece did him honour, and solemnized his Funerals.

CHAP. XXXIII.

¶ Persons of a diuine spirit and heavenly nature.

A mong women, *Sybill* was excellent at diuination, and for a certaine fellowship and societie with coelestiall wights, of great name. As for men, among the Greeks, *Melampus*: and with vs Romans, *Martius*, carried as great an opinion.

CHAP. XXXIV.

¶ *Scipio Nasica*.

E *Scipio Nasica* was iudged once by the Senat (sworne to speak without passion and affection) to be the best & honestest man that euer was from the beginning of the world: howbeit the same man, as vpright as he was, suffered a repulse and disgrace at the peoples hands in his white Robe when he sued for a dignity; and to conclude, in the end his hap was not to depart this life in his owne countrey; no more than it was the will of God that *Socrates* the wisest man (so deemed by the Oracle of *Apollo*) should die out of prison.

CHAP. XXXV.

¶ Of Chastitie.

S *Plpitia*, daughter of *Paterculus*, and wife to *Fulvius Flaccus*, by al the voices in general of Roman dames, carried away the prize for continencie, and was elected out of the hundred principall matrons of Rome to dedicate and consecrate the image of *Venus*, according to

and ordinance out of *Sybilis* bookes. *Claudia* likewise, was by a religious and deuout experient proued to be such another, at what time as she brought the mother of the gods, *Cybele* to Rome.

CHAP. XXXVI.
Of Pietie or kindenesse.

IN all parts verily of the world, there haue been found infinite examples of naturall loue and affection, but one example thereof at Rome hath been knowne singular about all others, and incomparable. There was a poore young woman of the common sort, and therefore base and of no account, who lately had been in childbed, whose mother was condemned to perpetuall prison, and there lay, for some great offence that she had committed: this daughter of hers and young nourse aforesaid, obtained leaue to haue acceffe vnto her mother, and euermore by the gaoler was narrowly searched for bringing to her any victuall, because her iudgment was to be famished to death: thus she went and came so long, vntill at last she was found suckling of her mother with the milke of her breasts. This was reputed for such a strange and wondrous example, that the mother was releas'd and given to the daughter for her rare pietie and kindnes: both of them had a pension out of the city allowed them for their amaintenance for euer; and the place where this hapned was consecrated to *Pietie*: in so much, as when *C. Quintius* and *M. Acilius* were Consuls, there was a temple to her built, in the very place where this prison stood, iust whereas now standeth the Theatre of *Marcellus*. The father of the *Gracchi* happened to light vpon and take two serpents within his house, whereupon he sent out to the Sooth-sayers for to know, what this thing might presage: who made this answer, That if he would himselfe liue, the female snake should be killed; Nay marry (qd. he) not so, but rather kill the male; for my wife *Cornelia* is yong enough, and may haue more children. This said he, meaning to spare his wifes life, in consideration of the good she might do to the common-weale. And in truth; like as the wizards prophesied, so it fell out soone after, and their words tooke effect. *M. Lepidus* so entirely loued his wife *Apuleia*, that he died for very thought and griefe of heart, after shee was diuorced from him and turned away. *P. Rutilius* chanced to be somewhat ill at ease and sickish, but hearing of his brothers repulse, and that hee was put by his Consulship (for which he stood in suit) died suddenly for sorrow. *P. Catiens Philotimus* so loued his Lord and master, that notwithstanding he was by him made his sole heire of all that euer he had, yet for kind heart, cast himselfe into the funerall fire to be burnt with him.

CHAP. XXXVII.

Of diuers excellent men in many Arts and Sciences, and namely in Astrologie, Grammer, and Geometrie.

IN the skill and knowledge of sundry Sciences, an infinit number of men haue excelled; howbeit, we wil but take the very floure of them all, and touch those only whom meet it is to be named for their speciall desert. In Astrologie, *Berosus* was most cunning; in so much as the Atheniens for his diuine predictions and prognostications, caused his statue with a golden tongue, to be erected in the publicke schoole of their Vniuersitie. For Grammer, *Apollodorus* was singular, and therefore was highly honored of the States of Greece, called Amphictyones. In Physicke, *Hippocrates* excelled, so far forth as by his skill hee foretold of a pestilence that should come out of Sclauonia; and for to cure and remedie the same, sent forth his disciples and schollers to all the cities about. In recompence of which good desert of his, all Greece by a publick decree ordained for him the like honors, as vnto *Hercules*. For the very same cunning and science, king *Ptolome* gaue vnto *Cleombrotus* of Cea (at the solemne feast holden in the honour of the great mother of the gods) a hundred talents, and namely for curing the king *Antiochus*. *Critobulus* likewise acquired and got himselfe a great name, for drawing an arrow forth of king *Philips* eie, and curing the wound when he had don, so as the sight remained, & no blemish or deformity appeared. But *Asclepiades* the Prusian, surpassed all others in this kind, who was the first author of that new sect which bare his name, reiect'd the embassadors, the large promises & fauors offered of *K. Mithridates*: found out the way and means to make wine wholesome and medic-

A medicinable for sicke folke: and recovered a man to his former state of health, who was caried forth vpon his biere to be buried: and lastly he attained the greatest name; for laying a wager against fortune, and pawning his credit so farre as he should not be reputed a Physitian, in case he euer were known to be sicke or any way diseased. And in truth the wager hee woon; for his hap was to liue in health vntill he was very aged, and then to fall downe from a paire of staires, and so to die suddenly. A singular testimonie of skill and cunning *M. Marcellus* gaue vnto *Archimedes* that notable Geometrician and Engineer of Syracusa, who in the saccage and rifling of that city gaue expresse commandement concerning him alone, that no violence should be done vnto him: howbeit hee will failed of his execution, by occasion of a souldier, who in that hurly-burly slew him, not knowing who he was. Much commended and praised is *Ctesiphon* of Gnosos, for his notable knowledge in Architecture, and namely for the wonderful frame of *Dianacs* Temple at Ephesus. *Philon* likewise was highly esteemed for making the Arsenall at Athens, able to receiue 1000 ships. *Ctesibius* also was much accounted of for deuising winde Instruments; and by means of certain engins to draw and send water to any place. *Dinocrates* also the enginier eternised his name for casting the plot and deuising the modell of Alexandria in Egypt, at what time as *Alexander* the great founded it. To conclude, this mighty prince and commander *Alexander* streightly forbad by expresse edict, That no man should draw his pourtrait in colours but *Apelles* the painter: that none should engraue his personage but *Pyrgoteles* the grauer: and last of all, that no workman should cast his image in brasse but *Lysippus* a Founder. In which three feats many Artisans haue excelled for their rare workmanship.

CHAP. XXXVIII.

Singular works of Artificers.

King *Attalus* cheapned one picture wrought by the *Aristides* Theban, and 100 talents for it. *Cesar* the Dictator offered to *Timomachus* eight talents for two pourtraits, to wit, of *Medea* and *Ajax*, which he meant to set vp and consecrate in the temple of *Venus Genetrix*. King *Candaules* bought of *Butarchus* a painted table, wherein was drawne the defeat and destruction of the Magnetes, which tooke vp no great roome, and weighed out the poise thereof in good gold. King *Demetrius*, surnamed *Expugnator*, [i. the conqueror and great forcer of cities] forbore to set Rhodes on fire, because he would not burne one painted table the handiwork of *Protagenes*. *Praxiteles* was innobled for a rare Imager and cutter in stone and marble: he eternised his memoriall by making one image of *Venus* for the Gnidians, so liuely, that a certaine yong man became so amorous of it, and so doted thereon, that he went beside himselfe: which piece of worke was esteemed of such worth by *Nicomedes*, that whereas the Gnidians owed him a great sum of money, he would haue taken it for full paiement of the whole debt. The statue of *Iupiter Olympius* is to be seen, and dayly commendeth the workman *Phydias*. *Iupiter* likewise *Capitolinus*, and *Diana* in Ephesus yeeld good testimonies of *Menors* cunning: and the tooles or instruments of the said workman were consecrated (for their exquisite making) vnto them in their temples, and there remaine.

CHAP. XXXIX.

Of Seruants and Slaues.

I Haue not knowne or heard to this day, of a man borne a slaue, that was prised so high as *Daphnis* the Grammarian was: for *Cn. Priscus* held him at 300700 Sesterces to *M. Scaprus* a great and principall man of Rome. Howbeit in this our age certain stage players haue gon beyond this price, and that not a little: many they were such as had bought out their freedom before, and were not then slaues. And no maruell, for we finde vpon record, that the great Actor *Roscus* in former time might yerely dispend by the stage 500000 Sesterces. Vnlesse a man desire in this place to heare of the Treasurer and purueior general of the army in Armenia for the late wars of King *Tyridates*, who was enfranchised by means of *Nero*, for 120000 Sesterces, but it was the war that cost thus much, and not the man. Like as *Sutorius Priscus* gaue vnto *Seianus* 3500 Sesterces for *Pazon* one of his gelded Eunuchs: For a man would say that this was

was more to satisfie his filthy lust, than for any special beauty to be seen in the said *Pezon*. But he tooke the vantage of the time, and went cleare away with this impious villanie: for at what time as he bought him, the city was in perplexitie and sorrow, and no man for thinking of greater affaires and troubles, had any leisure to finde fault or say a word in reproofe of such enormities.

CHAP. XL.

¶ The excellencie of Nations.

Doubtlesse it is, and past all question, that of all Nations vnder the Sun, the Romans excell and are the only men for all kinde of vertues. But to determine who is the happiest man in all the world is aboue the reach of humane wit; considering that some take contentment and repose felicitie in this thing, others in that, and euery one measureth it according to his seuerall fancy and affection: but to say a truth, and iudge aright indeed, laying aside all the glossing flatteries of fortune, and without courting her to determin this point, There is no man to be counted happy in this world. Right well it is on our side, and Fortune dealeth in exceeding fauor with vs, if we may not iustly be called vnhappy: for put case there be no other miserie and calamitie besides, yet surely a man is euer in feare lest Fortune will frowne vpon him, and do him a shrewd turne one time or other: and admit this feare once, there can be no sound happinesse and contentment in the minde. What shall I say moreouer than this, that no man is at all times wise and in his perfect wits? Would God that this were taken of most men for a Poets word only, and not a true saying indeed. But such is the vanity and folly of poore mortall men, that they flatter themselves, and are very witty to deceiue themselves, making their accounts and reckonings of good and euill fortune like to the Thracians, who by certain white and blacke stones which they cast into a certaine vessell, and there laid vp for the better proofe and triall of euery dayes fortune; and at the last day and time of their death they fall to parting these stones one from another, and telling them apart, and according to the number of the white and blacke, giue iudgement and pronounce of each ones fortune. But what say they to this, that many times it falleth out, that the day marked with a white stone, for a good day, had in it the beginning & ouerture of some great misfortune and calamitie? How many men haue seemed to fall into Fortunes lap, and entred vpon great empires and dominions, which in the end turned to their afflictions and miseries? How many haue we seen ouerthrowne, punished extremely, and brought to vtter ruine, euen by means of their owne good parts and commendable gifts? Certes these be good things & great fauors, if a man could make full account to enioy them but one houre with contentment. But thus verily stands the case, and this is the ordinary course of this world: one day is the iudge of another, and the day of death iudgeth and determineth all: and therefore there is no trust in them, neither may wee assure our selues of any. To say nothing of this, that our good fortunes are not in number equall to our bad: and say there were as many of the one as of the other, Is there any one ioy to be weighed in true ballance against the least grief and sorrow that commeth? Foolish and sortish men that we are for all our curiositie! for we reckon our daies by tale and number, whereas we should ponder and peise them by weight.

CHAP. XLI.

¶ Of the highest tipe and pitch of felicity.

Lampido the Lacedemonian Lady is the only woman that euer was knowne to haue bene daughter to a King, a Kings wife, and mother to a King. Also *Phenice* was known alone to be the daughter, sister, and mother to them that wan the victorie and carried away the best prize at the Olympian games. In one house and race of the *Curices* there were known three excellent Orators one after another by descent from the father to the son. The only family and line of the *Fabij* affoorded three Presidents of the Senat in course, one immediatly vnder another, to wit, *M. Fabius Ambustus* the father, *Fabius Rullianus* the father, *Fabius Rullianus* the son, and *Q. Fabius Gurges* the nephew.

CHAP.

CHAP. XLII.

¶ Examples of Fortunes mutabilitie.

Infinite other examples we haue of the varietie and inconstancie of Fortune: for what great ioyes to speake of, gaue she euer, but vpon some mishap or other? Again, the greatest miseries and calamities that haue bin, haue they not ensued vpon the most ioyes and contents.

CHAP. XLIII.

¶ Of one twice outlawed and out of protection: as also of *Q. Metellus* and *L. Sylla*.

Fortune preferred for 36 yeares *M. Fiduſius* a Senator, outlawed by *Sylla*: yet hapned hee afterward to be outlawed the second time; for he out-liued *Sylla*, and continued vnto the time of *Marcus Antonius*: and for certain it is knowne, that by him hee was banished and outlawed againe, for no other reason but because he had been so before time. So kind was Fortune to *P. Ventidius*, as that she would haue him to triumph alone ouer the Parthians: but shee had before time so good as played with him, when shee saw him led (being a boy) as prisoner in *Cn. Pompeius Strabo* his triumph for the defeature and ouerthrow of the *Asulan*s. Although *Massurius* testifieth, that he was so led in triumph as a slaue twice: *Cicero* saith, that hee was at first but a Mulitier, and draue mules laden with meale for the oven, to serue the campe. Many other affirme, that in his youth hee was a poore souldier, and serued as a footman in his single trouſes and grieues. Moreouer, such good fortune had *Valbus Cornelius*, as to the senior Conſull accused, yea and a Iury was impanelled to go vpon him, so as he was in danger to be whipped, vpon their verdict. Well, this mans hap for all this was to be the first Roman Conſull of Forreiners, and namely *I*landers within the main Ocean: he (I say) attained to that honor, which our forefathers denied flatly to the Latines their neighbors. Among other notable examples, *L. Fulvius* may go for one, who was Conſull of the *Tusculans* when they reuolted and rebelled against the Romans: howbeit forsaking his owne citifens, and returning to Rome, was presented by the whole people aduanced to the same honour amongst them, and he was the man alone knowne to haue triumphed in Rome ouer them whose Conſull he was, euen the same yere that he himselfe was as a Roman enemy in the field. *L. Sylla* was the only man vntill our time that challenged vnto himselfe the syname of *Felix*. But how was hee adopted as it were into this name, forsooth euen by shedding and spilling so much innocent blood of Roman citifens, and by waging war against his native country? And whereupon I pray you grounded he this happinesse of his, and had so great an opinion thereof, if this were not it, that he was able to banish, that he was able to banish, confiscate, and put to death so many thousand citifens? O false and deceitfull interpretation, dangerous, vnhappy, and pernicious euen to posteritie and the time to come! For were not they more blessed and happy, who then fortun'd to lose their liues, (whose death at this day we pity, and whom we take compassion of) than *Sylla*, whom all men at this day hateth and abhorreth? Moreouer, was not his end more cruell and horrible than the sorrow of all those that by him were outlawed, and their goods forfeit? for his owne wretched body did eat, gnaw, and consume it selfe, and bred daily and hourelly lothsome vermine to put the fame to paine and torment. And say that he dissembled all this, and would not be knowne of it; and suppose we gaue credit that last dreame of his (wherein he lay as it were dead or in a trance) vpon which he gaue out this speech, that himselfe and none but he had the glory to surmount all enuy: yet in this one thing he plainly confessed that his felicitie came short & was defectiue, in that he had not time to consecrate the Capitoll Temple. *Q. Metellus* in that funerall oration of his which he made in praise and commendation (as the maner was) of *L. Metellus* his father, gaue these laudable reports of him, that he had been the foueraigne Pontife or high-Priest of Rome, twice Conſull, Dictator, Generall of the horse, one of the fifteen Quindecemvirs deputed for diuision of lands among the souldiers and Commons: and that in the first Punicke warre he shewed many Elephants in a triumph: moreover he left in writing, that hee had accomplished ten of the greatest and best points belonging to this life: in the seeking whereof

whereof and in attaining thereunto, all the great Sages of the world spend their whole life: for (saith he) his desire was, and he thereto aimed, namely, to be a most doubty and hardy warrior, an excellent orator, a right valiant captaine and commander: also, to haue the conduct, charge, and execution of the greatest and most important affaires, to be in the highest place of honor, to be singular in wisdom, to be accounted the principall and chiefe in Senat, to come to great riches by good and lawfull means, to leaue much faire issue behind him: and to conclude, to be simply the best man of all other, and the principall person in the city. To these perfections he (and none but he since Rome was Rome) attained. Now to confute this were a long and needlesse picke of worke, considering that one only mischance checked these fauors of Fortune, and fully disproued all: for the very same *Metellus* became blinde in his old age, for hee lost his eyes in a skare-fire, at what time hee would haue saued and got away the *Palladium*, i. Image of *Minerva*, out of the temple of *Vesta*. His act I confesse was vertuous and memorable, but the event was ill for him and miserable. In regard whereof I know not how he should be called vnhappy and wretched: and yet I see not why he should be named happy and fortunate. This I must needs say in conclusion, that the people of Rome granted vnto him that priuiledge, that nener man in the world was knowne to haue, namely, to ride in his coach to the Senat house so oft as he sate at the counsell table. A great prerogatiue I confesse, and most stately, but it was allowed him for want of his eyes.

CHAP. XLIV.

¶ Of another *Metellus*.

A Sonne likewise of this *Metellus*, who gaue out those commendations aforesaid of his father, may be put in the ranke of the most rare presidents of felicitie in this world: for besides the most honorable dignities and promotions hee was aduanced vnto in his life time, and the glorious addition and surname of *Macedonicus*, which he got in Macedonia; when he was dead, there attended vpon his dead corps at his funerals to inter him, foure of his sons; the one Pretor for the time being; the other three had been Consuls in their time: & of these three, two had triumphed in Rome, and the third had been Censor. These were points, I may tell you, of great note and regard, and few men are to be found in comparisn, that can come to any one of them. And yet see! in the very prime and floure of all these honors, it fortuneed that *Catinius Labo*, surnamed *Macerio*, a Tribune or protector of the Commons (whom he before by vertue of his Censorship had displaced out of the Senat) waited his time when he returned about noone from *Mars* field, and seeing no man stirring in the market place, nor about the Capitoll, tooke him away perforce to the cliffe *Tarpeius*, with a full purpose to pitch him downe headlong from thence and to breake his necke. A number came running about him, of that crue and company which was wont to salute him by the name of Father; but not so soone as such a case required, considering this so sudden an occurrent: and when they were come, went but slowly about any rescue, and kept a soft pace, as if they had waited vpon some corps to a buriall; and to make resistance and withstand perforce the Tribune, armed as he was with his sacrosanct and inuolable authoritie, they had no warrant by Law: insomuch as hee was like to haue perished and come to a present mischance, euen for his vertue, and faithfull execution of his Censorship, had there not been one Tribune of ten found, hardly and with much adoe to step between and oppose himselfe against his Colleague, and so by good hap rescued him out of his clutches, and saued him as it were at the very pits brinke, enen from the vtter point of death. And yet he liued afterwards of the courtesie and liberality of other men: for why, All his goods from that day forward were seised as forfeit and confiscate, by that Tribune whom before time he had condemned: as if hee had not suffered punishment and sorrow enough at his hands, to haue his necke so wrythed by him, as that the blood issued out at his very eares. Certes for mine owne part I would reckon this for one of his crosses and calamities, That hee was an enemy to the later *Africanus Emilianus*, euen by the testimonie and confession of *Macedonicus* himselfe: for after the death of the said *Africanus*, these were his words vnto his owne sonnes; Go your waies sirs and do honour to his Obsequies, for the funerall of a greater perennage, and a better Citisen, shall you neuer see. And this spake he to them when as they had conquered *Creta* and the *Balear Islands*, and thereof were surnamed *Creticus* and *Balearicus*, and

A and had worne the lawrell diadem in triumph; being himselfe already entituled with the stile of *Macedonicus*, for the conquest of Macedonia. But if we consider and weigh that onely wrong and iniurie offered him by the Tribune, who is it that can iustly deeme him happy, being exposed as he was to the pleasure, mercy, and force of his enemy, far inferior to *Africanus*, and so to come to confusion? What were all his victories to this one disgrace? what honors and triumphant chariots strooke nor Fortune downe with her foot, and ouerturned all againe, or at least wife set not back again with this her violent course, suffering a Roman Censor to be haled and tugged in the very heart of the city (the only way indeed to bring him to his death) to be harried I say vp to that capitoll hill there to make his end, whither aforetime hee ascended triumphant, but neuer committed that outrage vpon those prisoners and captiues whom hee lead in triumph, and for whose spoiles he triumphed, as to hale and pull them in that rude sort? And verily the greater was this outrage, and seemed the more heinous, in regard of the felicity that afterward ensued: considering, that this *Macedonicus* was in danger to haue lost so great an honor as he had in his sollemne and stately sepulture, namely when he was caried forth to his funerall fire by his triumphant children, as if he had triumphed once again at his buriall. In sum, that can be no sound and assured felicitie that is interrupted with any indignitie or disgrace whatsoeuer: much lesse by such an one as this was. To conclude, I wot not well whether there be more cause to glory for the modest carriage of men in those daies, or to grieue at the indignitie of the thing, in that among so many *Metelli* as there were, so audacious a villanie as this was of *Catinius* was neuer reuenged vnto this day.

CHAP. XLV.

¶ Of *Augustus Caesar* late Emperor.

As touching the late Emperor *Augustus*, whom all the world rangeth in this ranke of men fortunat: if we consider the whole course of his life we shall find the wheele to haue turned often, and perceiue many changes of variable fortune. First, his owne vnclie by the mothers side put him by the Generalship of the horse, and notwithstanding all his earnest suit preferred *Lepidus* to that place before him: secondly, he was noted and thought hardly of for those outlawries of Roman citizens, and thereby purchased himselfe much hatred and displeasure: tainted also he was for being one of those three in the Triumvirate, yoked and marched with wicked companions and most dangerous members to the weal publique: and this galled him the more, that in this fellowship, the Roman empire was not equally and indifferently parted among them three, but *Antonie* went away with the greatest share by odds. Also his ill fortune was in the battell before *Philippus* to fall sicke, to take his flight, and for three daies, diseased as he was, to lurke and lie hidden within a marish: whereupon (as *Agrippa* and *Mecenas* confesse) he grew into a kinde of dropsie, so as his belly and sides were puffed vp and swelled with a waterish humor, gotten and spread betwixt the flesh and the skin. Furthermore, he suffered shipwreke in Sicily, and there likewise he was glad to skulk within a caue in the ground. What should I say, how when he was put to flight at sea, and the whole power of his enemies at his heeles, he besought *Proculus* in that great danger to rid him out of his life: how he was perplexed for the quarrels and contentions at *Perusium*: in what feare and agonie hee was in the battell of *Actium* (a towne of *Albanie*) as also for the issue of the Pannonian warre, for the fall of a bridge and a towne both. So many mutinies among his soldiers; so many dangerous diseases: the iealousie and suspicion that he had euermore of *Marcellus*: the reproch & shame he sustained for confining and banishing *Agrippa*: his life so many times laid for by poison and other secret traines: the death of his children, suspected to haue bin by indirect meanes: the double sorrow and grief of heart thereby, and not altogether for his childlesse estate. The adulterie of his owne daughter, and her purpose of taking his life away, detected and published to the World: the reprochfull departure and slipping aside of *Nero* the sonne of his Wife: another adulterie committed by one of his owne Nieces.ouer and aboue all this, thus many more crosses and troubles comming one in the necke of another: namely, want of pay for his souldiers, the rebellion of *Sclauonia*, the mustering of slaues and bond seruants to make vp his army, for want of other able youths to leuy vnto the warres: Pestilence in Rome Citie: famine and drought vniuersally throughout Italy: and that which more is, a deliberat purpose

and resolution of his to famish and pine himselfe to death, hauing to that end fasted 4 dayes and 4 nights; and in that time receiued into his body the greater part of his owne death. Besides, the ouerthrow and rout of *Varius* his forces, the foule staine and blemish to the touch of his honor and maiestie very neere: the putting away of *Posthumius Agrippa* after his adoption, and the misse that he had of him after his banishment: then, the suspition that hee conceived of *Fabius* for disclosing his secrets: adde hereto the opinion and conceit he tooke of his owne wife and *Tiberius*, which surpassed all his other cares. To conclude, that god, and he who I wot not whether obtained heauen, or deferred it more, departed this life, and left behinde him as heire to the crowne his enemies sonne.

CHAP. XLVI.

¶ Whom the gods iudge most happy.

I Cannot ouerpasse in this discourse and consideration the Oracles of Delphos, deliuered from that heauenly god to chaastise and repress as it were the folly and vanitie of men: and two there be which giue answer to the point in question after this manner: First, that *Phedrus*, who but a while before died in the seruice of his countrey, was most happy. Moreouer, *Gyges* (the most puissant king in those daies of all the earth) sent a second time to know of the Oracle, who was the happiest man next him: and answer was made, That *Aglans Psophidius* was happier than the former. Now this *Aglans* was a good honest man well steeped in yeares, dwelling in a very narrow corner of Arcadia, where he had a little house and land of his own, sufficient with the yearely commodities thereof to maintaine him plentifully with ease, out of which hee neuer went, but employed himselfe in the tillage and husbandry thereof, to make the best benefit he could: in such sort that (as it appeared by that course of life) as he coueted least, so he felt as little trouble and aduersitie while he liued.

CHAP. XLVII.

¶ Who was canonised a god here vpon earth liuing.

BY the ordinance and appointment of the same Oracle, as also by the ascent and approbation of *Iupiter* the foueraigne god, *Enthyus* the famous wrestler (who alwaies wan the best prize at Olympia saue once) was reputed and consecrated a god while he liued, and knew thereof: born he was at Locri in Italy, where one statue of his, as also another at Olympia, were both in one day stricken with lightning: whereat I see *Callimachus* wondred, as if nothing else were worthy admiration, and gaue order that he should be sacrificed vnto as a god: which was performed accordingly both while he liued, and after hee was dead. A thing that I maruell more at than any thing else, That the gods were therewith contented, and would permit such a dishonour to their maiestie.

CHAP. XLVIII.

¶ Of the longest liues.

THE terme and length of mans life is vncertaine, not only by reason of the diuersity of climates, but also because Historians haue deliuered such varietie of mens ages, and euerie man by himselfe hath a seuerall time limited vnto him at the very day of his birth. *Hesiod* (the first writer, as I take it, who hath treated of this argument, and yet like a Poet) in his fabulous discourse touching the age of man faith forsooth, that a crow liues nine times as long as we; and harts or stags 4 times as long as hee, but Rauens thrice as long as they. As for his other reports touching the Nymphs and the bird Phoenix, they are more like poeticall tales, than true relations. *Anacreon* the Poet maketh mention, that *Arganthionius* king of the Tartarians, liued 150 yeares: and *Cynarus* likewise King of the Cyprians ten yeares longer. *Theopompus* affirmeth, that *Epimenides* the Gnosian died when he was 157 yeares old. *Hellanicus* hath written, That amongst the Epians in *Ætolia* there be some that continue full two hundred yeares: and with him accordeth *Damastes*: adding moreouer, that there was one *Pictoreus* among them, a man of exceeding stature, mighty and strong withall, who liued three hundred yeares.

Ephorus

A *Ephorus* testifieth, that ordinarily the kings of Arcadia were 300 yeares old ere they died. *Alexander Cornelius* writeth of one *Dando* a Sclauonian, who liued 500 yeares. *Xenophon* in his treatise of old age, makes mention of a King of the Latines, or as some say, ouer a people vpon the sea coasts, who liued 600 yeares; and because he had not liued loud enough already, he goes on still and faith, that his son came to 800. All these strange reports proceed from the ignorance of the times past, and for want of knowledge how they made their account; for some reckoned the Summer for one yeare, and the Winter for another. There were againe that reckoned euery quarter for a yeare, as the Arcadians, whose yeare was but three moneths. Ye shall haue some, and namely the Egyptians, that count euery change or new Moon for a yeare: and therefore no maruell if some of them are said to liue 1000 yeares. But to passe from these vncertainties, to things confessed and doubtlesse. Held it is in maner for a certain truth, that *Arganthionius* King of Calis reigned full 80 yeares, and it is thought he was 40 yeares old when he came vnto the crowne. And as vndoubted true it is, that *Masanis* sawe the crown 60 yeares. As also that *Gorgias* the Sicilian liued vntill he was 108 yeares old. As for *Q. Fabius Maximus* (a Roman) hee continued Augure 63 yeares. *M. Perpenna*, and of late daies *L. Volusius Saturninus*, out liued all those Senators which sate in counsell with them when they were Consuls, and whose opinions they were wont to aske. As for *Perpenna*, when hee died, hee left but 7 of those Senators aliue, whom he had either chosen or re-elected in his Censorship: and he liued himselfe 98 yeares. Where by the way one thing commeth into my mind worth the noting, That one *Lustrum* or 5 yeares space there was, and neuer but one, in which there died not a Roman Senator, and that was from the time that *Flaccus* and *Albinus* the Censors finished their suruey, & solemnly purged the city after the order, to the comming in of the next new Censors, being from the foundation of Rome 579 yeares. *M. Valerius Corvinus* liued 100 yeares complete: between his first and sixt Consulute were 46 yeares; he tooke his seat vpon the yuorie chaire of estate, and was created a magistrate Curule 21 times; and no man else so often. *Marcus* the Pontife or foueraigne priest liued full as long as he.

To come now to women: *Liuis* the wife of *Rutilius* liued 97 yeares with the better. *Statilia* a noble lady of Rome, in the time of *Claudius* the Emperor, was knowne to be 99 yeares of age. *Ciceroes* wife *Terentia* out-liued her husband vntill she was 103 yeares old. *Clodia* wife to *Ostius*, went beyond her, and saw 115 yeares, & yet she had in her youth 15 children. *Luceia* a common vice in a play, followed the stage and acted thereupon 100 yeares. Such another vice that plaid the foole & made sport between whiles in interludes, named *Galaria Copiola*, was brought again ro act her feats vpon the stage, when *Cn. Pompeius* and *Q. Sulpitius* were Consuls, at the solemn plaies vowed for the health of *Aug. Cesar* the Emperor, in the 104 yere of her age: the first time that euer she entred the stage, to shew proofe of her skill in that profession, was 91 yeares before, and then she was brought thither by *M. Pomponius* an *Ædile* of the Commons, in the yere that *C. Marius* and *Cn. Carbo* were Consuls. And once again *Pompeius* the Great, at the solemn dedication of his stately Theatre, trained the old woman to the stage for to make a shew, to the wonder of the world. Moreouer, *Africanus Padianus* is mine Author, that one *Samula* liued 110 yeares; and therefore I maruell the lesse, that one *Stephanio* (who was the first of the long robe that brought dancing and footing vpon the stage) plaid his part & danced in both the Secular plaies, as well those that were set out by *Augustus* late Emperor, as which *Claudius* exhibited in his 4 Consulute, considering that between the one and the other there were but 63 yeares: and yet liued *Stephanio* many a day after. *Mutianus* witnesseth, that in *Tempsis* (for so is the crest or pitch of the mountain *Tmolus* called) folke liued ordinarily 150 yeares. At that age *T. Fullo* of Bononia entred his name into the Subsidie book, at the time that *Cl. Cesar* held the generall tax: and that he was so old indeed, appeared truly as wel vpon record in the registers office, by conferring and laying together feuerall payments by him made from time to time, as also by certain things he had seen and known done in his life time (for the Emperor had a speciall care and regard, that way to find out the truth.)

CHAP. XLIX. Of diuers Horoscopes or Natiuities of men.

THIS point would require the conference and aduice of Astrologers: for *Epigenes* saith, it is not possible for a man to liue 122 yeares: and *Berosus* is of opinion, that one cannot passe 117. The proportion and reckoning holdeth still for good, which *Petofirus* and *Nesepsis* calcula-

R

calculated and grounded vpon their Quadrant, which they call *Tetartemorion*, that is to say, the compasse in the Zodiaque of three signes: Orientall, which determine of the life or death of men, according to which account it is euident, that in the tract or clymat of Italy men may reach to 126. yeares. The aboue-named Astrologers affirmed, that a man could not possibly passe the space of 90 degrees from the Ascendent or erection of his natiuitie (which they call *Anaphoras*) and that euen this course through the degrees of three signes, is many times interrupted and cut short, either by the opposition and encounter of some wicked planets, or by the maligne aspects of them or the Sun. On the other side, *Asclepiades* and his sect affirme, that the length of our life proceedeth from the influence of the [fixed] stars: but as touching the utmost terme thereof they set downe nothing definitiue: many thus much they say, That the fewest sort of men liue any long time; for that the greatest number by far haue their natiuitie incident and liable to the dangerous houres and time, either of the moones occurrence (as in her Quadrature, Opposition, and Sextile aspect) or of daies according to the number of seuen or nine (which are daily and nightly marked and obserued): whereupon ensueth the rule of the dangerous graduall yeares, called *Clymaactericke*: and such as are in that wise borne, lightly liue not aboue 54 yeares. And here we may see by the doubtfulness and incertitude of this science of Astrologie, how vncertain this whole matter is which we haue in hand. Moreover, we found the contrarie by experience and many examples; and namely in the last taxation, numbring, and review of the prouinces subiect to Rome within Italy, that was taken vnder the *Cæsars Vespasians*, the father and the sonne, both Emperors and Censors. And here we need not to search euery corner, and to ransacke euery place very narrowly; we will onely giue instance and set downe the examples of the one moiety thereof, namely that tract which lieth betwene Apennine and the Po. At Parma three men were found that liued fixe score yeares: at Brixels, one that liued 125 yeares: at Plaisance one elder by a yeare: at Faventia there was one woman 132 yeares old: at Bononie, *L. Terentius* the sonne of *Marcus*; and at Ariminum, *M. Aponius*, reckoned each of them 150 yeares. *Tertullus* was knowne to be 137 yeares old. About Plaisance there is a towne situate vpon the hills, named *Velleiacium*, wherein six men brought a certificate, that they had liued an hundred yeares apiece: foure likewise came in with a note of an hundred and twenty yeares: one, of an hundred and fourteene, namely *M. Mutius*, son of *Marcus*, named *Galerius felix*. But because we will not dwell long in a matter so euident and commonly confessed: in the review taken of the eighth region of Italy, there were found in the rolle 54 persons of an hundred yeares of age: 57 of an hundred and ten: two, of 125: foure of 130: as many that were 135 or 137 yeares old: and last of all, three men of an hundred and fortie. But let vs leaue these ages, and consider awhile another inconstant variety in the nature of mortall men: *Homer* reporteth, that *Helior* and *Polydamas* were borne both in one night, men so different in nature and qualitie. Whiles *C. Marius* was Consul, and *Cn. Carbo* with him, who had been twice before Consul, the fifth day before the calends of Iune, *M. Cæcilius Rufus* and *C. Licinius Calvus* were borne vpon a day, and both of them verily proued great Orators: but they sped not alike, but mightily differed one from another in the end. And this is a thing seen daily to happen throughout the World, considering that in one houre kings and beggars are borne, likewise lords and slaues.

CHAP. L.

¶ Sundry examples of diuers Diseases.

P^{vb.} *Cornelius Rufus*, who was Consul together with *M. Curius*, dreamed that he had lost his sight, and it proued true indeed, for in his sleep he became blind & neuer saw again. Contrariwise *Phalerus*, [or *Iason Phereus*] being giuen ouer by the Physicians for an impostume he had in his chest, in dispaire of all health (purposing to kill himselfe for to be rid out of his paine) Rabbed his breast with a knife: but he found this deadly enemy to be his onely Physitian. *Q. Fabius Maximus* being long sicke of a quartane Ague, stricke a battell with the People of Saouy and Auvergne neere the riuier Isara, vpon the sixth day before the Ides of August, wherein

- A** wherein he slew of his enemies 13000, and therewith was deliuered from his feuer, and neuer had it after. Certes this gift of life that we haue from nature, be it more or lesse, is fraile & vncertain; and say that it be giuen to any in largest measure, it is but scant yet, and very short, yea and of but small vse, if wee consider the whole course thereof from the beginning to the end. For first, if we count our repose and sleep in the night season, a man can be truly said to liue but halfe his life; for surely a good moiety and halfe deale thereof which is spent in sleeping, may be likened well to death: and if he cannot sleep, it is a pain of all pains, and a very punishment. I reckon not in this place the yeares of our infancie, which age is void of reason and sense; ne yet of old age, which the longer it continueth, the more are they plagued that be in it. What should I speake of so many kindes of dangers, so many diseases, so many feares, so many persue cares, so many prayers for death, as that in maner we pray for nothing oftner? In which regards how can a man be said to liue the while? and therefore Nature knoweth not what better thing to giue a man than short life. First and formost, the senses wax dull, the members and limmes grow benumbed, the eye sight decayeth betimes, the hearing followeth soone after, then faile the supporters, the teeth also and the very instruments that serue for our food and nourishment: and yet forsooth all this time so full of griefe & infirmities is counted a part of our life. Hereupon it is taken for a miraculous example, and that to which again we cannot find a fellow, that *Xenophilus* the musitian liued 105 yeares, without any sickness or defect in all his body. For all other men, beleue me, are vexed at certain houres (like as no other creatures besides) with the pestiferous heats and shaking colds of the feuer in euery ioynt, sinew, and muscle of the body, which go and come, keeping their times in their feuerall fits, not for certain houres in the day only, but from one day to another, and from night to night; one while euery third day or night, otherwhiles euery fourth, yea and somtime a whole yeare together. Moreover, what is it but a very disease, to know the time and houre of a mans death, and so to die forsooth in wise dome? For maladies there be in which Nature hath set down certain rules and lawes: namely a quartane feuer neuer lightly begins in the shortest daies of the yeare, neither in the 3 moneths of winter [to wit, December, Ianuarie, Februarie.] Some diseases are not incident to those that are about 60 yeares of age: others againe do end and passe away when youths begin to be undergrowne, and especially this is obserued in young maidens. Moreover, old folke of all other are least subiect to take the plague. Furthermore, sicknesses there be that follow this region or that, assailing and infecting the inhabitants generally therein. There be some againe that surpris and take hold of seruants only, both all and some: others touch the best persons alone of the highest calling, and so from degree to degree. But in this place obserued usually it is by experience, That a pestilence beginning in the South parts, goeth alwaies towards the West, and neuer lightly but in winter, neither continueth it about three moneths.

CHAP. LI.

¶ Of the signes of death.

- E****N**ow let vs take a view of deadly tokens in sickness: in rage and furious madnesse, to laugh is a mortall signe: in frenzie, wherein men are bestraght of their right wits, to take care of the skirts, fringes, and welts of their garments, that they be in good order; to keepe a fumbling and pleiting of the bed-clothes, the neglect of such things as would trouble them in their sleepe, and breake it: the voluntarie letting go of their water; prognosticate death. A man may see death also in the eyes and nose most certainly of all other parts: as also in the manner of lying, as namely when the patient lieth alwaies on his backe with his face vpward. We gather signes also by the vneuen stroke of the arterie; as also when the pulse beateth so vnder the physicians hand as if he felt an ant creeping vnder it. Other signes also there be, which *Hippocrates* the prince and chief of all Physicians hath very wel obserued and set downe. Now whereas there be an infinite number of signes that presage death; there is not one knowne than can assure a man certainly of life and health. For *Cato* that famous Censor, writing to his sonne as touching this argement, hath deliuered, as it were out of an Oracle, That there is an obseruation of death to be collected euen in them that are in the most perfect health: for (saith hee) youth resembling age, is a certaine signe of vntimely death or short life. As for diseases, they

are so innumerable, that *Pherecydes* of the Island *Syros* died of a great quantity of Lice that came crawling out of his body. Some are knowne to be neuer free from the Ague, as *C. Metanas*. The same man for three yeares before hee died neuer laid his cies together for sleepe a minute of an houre. *Antipater Sidonius* the Poet, once a yeare during his life had an ague fit vpon his birth day: he liued for all that to be an old man, and vpon the day of his natiuitie died in such a fit.

CHAP. LII.

¶ Of such as were carried forth vpon the Biers to be buried, and reuiued againe.

A *Viola*, one that had bin Confull, came againe to himselfe when he was cast or put into the funerall fire to be burnt: but because the flame was so strong that no man could come neere to recouer him, he was burnt quicke. The like accident befell to *Lu. Lamia*, Pretor lately before. As for *C. Atilius Tubero*, that he was brought aliue againe from the like fire, after he had bin Pretor of Rome, both *Messala Rufus* and many besides constantly affirme. See how it goeth with mortall men: see, I say, our vncertaine state and condition, and how we are born, exposed, and subiect to these and such like occasions of fortune: insomuch as in the case of man there is no assurance at all, no not in his death. We reade in Chronicles, that the ghost of *Hermotimus Clazomenius* was wont vsually to abandon his body for a time, and wandering vp and downe into far countries, vsed to bring him newes from remote places, of such things as could not possibly be knowne vnlesse it had bin present there: and all the while his body lay as halfe dead, in a trance. This manner it continued so long, vntill the *Cantharidæ*, who were his mortall enemies, tooke his body vpon a time in that extasie, and burnt it to ashes; and by that means disappointed his poore soule when it came backe againe, of that sheath, as it were, or case where she meant to bestow her selfe. Moreouer, we finde in records, that the spirit or ghost of *Aristæus* in the Island *Proconessus*, was seen evidently to fly out of his mouth in forme of a Raven; and many a like tale followeth thereupon. For surely I take it to be no better than a fable, which is in like manner reported of *Epimenides* the Gnosian, namely, that when he was a boy, he being for heate and trauell in his iourney all wearie, laid him downe in a certain caue, where he slept 57 yeares. At length he wakened as it were vpon the next morning, and wondred at such a sudden change of euery thing he saw in the world, as if hee had taken but one nights sleepe. Hereupon, forsooth, in as many daies after as he slept yeares, he waxed old. Howbeit he liued in all 175 yeares. But to returne to our former discourse, women of all others by reason of their sex are most subiect to this danger, to be reputed for dead when there is life in them: and namely because of the disease of the matrice called the rising of the Mother: which if it be brought againe, and ferled streight in the place, they soone recouer and take breath againe. Not impertinent to this treatise is that notable and elegant booke among the Greeks compiled by *Heraclides*, where he writeth of a woman that for a seuen night lay for dead, and fetched not her breath sensibly, who in the end was raised againe to life. Moreouer *Varro* reporteth, that vpon a timewhen the twenty deputy Commissioners were diuiding lands in the territory of *Capua*, there was one there carried forth vpon his bier to be burnt, and came home againe vpon his feet. Also, that the like hapned at *Aquinum*. Likewise, that in Rome one *Corfidius*, who had married his owne Aunt by the mothers side, after he had taken order for his funeralls, and set out a certaine allowance therefore, seemed to yeeld vp his ghost and die: howbeit hee reuiued againe, and it was his chance to carry him forth indeed vnto buriall, who had provided the furniture before for his funerall. This *Varro* writeth besides of other miraculous matters, which verily are worth the rehearfall at large. One of them is this: Two brethren there were, by birth and calling gentlemen of Rome; whereof the elder, named *Corfidius*, hapned in all appearance to die: and when his last will and testament was once opened and published, the younger brother (who was his heire) was very busie and ready to set forward his funerall. In the mean time the man who seemed dead fell to clap one hand against another, and therewith raised the seruants in the house: when they were come about him, he recounted vnto them, that he was come from his younger brother, who had recommended his daughter to his tuition and guardenage: and moreouer, had shewed and declared vnto him, in what place he had secretly hidden certain gold

A gold vnder the ground, without the priuity of any man; requesting him withal to imploy that funerall prouision which he had prepared for him, about his own buriall and sepulture. As he was relating this matter, his brothers seruitors came in great hast to this elder brothers house; and brought word their master was departed this life: and the treasure before-said was found in the place accordingly. And verily there is nothing more common in our daily speech, than of these diuinations; but they are not to be weighed in equall ballance with these, nor to be reported or credited all so confidently, forsomuch as for the most part they are mere lies, as we will proue by one notable example. In the Sicilian voiage it fortuneth that *Gabienus*, one of the brauest seruitors that *Cæsar* had at sea, was taken prisoner by *Sex. Pompeius*, and by commandement from him his head was stricken off in a manner, and scarce hung to the neck by the skin, and so lay he all day long vpon the sands in the shore. When it grew toward euening, and that a great companie were flocked about him, he fetched a great groane, and requested that *Pompeius* would come vnto him, or at leastwise send some one of his deare familiars that were neere vnto him. And why? Come I am (quoth he) from the infernal spirits beneath, and haue a message to deliuer vnto him. Then *Pompeius* sent diuers of his friends to the man, vnto whom *Gabienus* related in this manner: That the infernal gods were well pleased with the iust quarrell, and cause of *Pompeius*, and therefore he should haue as good issue therof as he could wish. This, quoth he, was I charged and commanded to deliuer. And for a better prooffe of the truth in effect, so soon as I haue done mine errand I shall forthwith yeeld vp the ghost. And so it hapned indeed. Histories also make mention of them that haue appeared after they were committed to earth: But our purpose is to write of Natures works, and not to prosecute such miraculous end prodigious matters.

CHAP. LIII.

¶ Of sudden Deaths.

A S for sudden death, that is to say, the greatest felicitie and happines that can befall man, many examples wee haue thereof that alwaies seeme strange and maruellous; howbeit they are common. *Verrius* hath set forth a number of them, but I will keepe within a meane, and make choice of them all. Besides *Chilon* the Lacedemonian, of whom we spake before, the died suddenly for very ioy, *Sophocles* the poet, and *Demis* a king or tyran of Sicily: both of them vpon tydings brought vnto them, that they had won the best prize among the tragical Poets. Presently after that famous defeat at *Cannæ*, a mother died immediately vpon the sight of her son aliue, whom by a false messenger she heard to haue bin slain in that battell. *Diodorus* a great professed Logician, for very shame that hee could not presently assoile a friuolous question, nor answer to some demands proposed by *Stilbo*, swooned and neuer came again. Without any apparant cause at all that could be seen, diuers haue left their life: namely two of the *Cæsars*, the one Pretor for the time being, the other who had borne that dignity, the father of *Cæsar* the Dictator: both of them in the morning when they were new risen, and putting on their shooes, the one at *Pisæ*, the former at Rome. In like manner *Q. Fabius Maximus* in his very Consulship, vpon the last day of December, [which was the last also of his magistracie, had hee liued longer] in whose place *Rebilius* made sute to be Confull for a very few houres that remained of that yere. Semblably *C. Fulcinius Gurginus* a Senator. All of them in perfect health, so lustie and well liking that they thought to go forth presently, and of nothing lesse than to dy before. *Q. Amylius Lepidus*, euen as he was going out of his bed chamber, hit his great toe against the dore fill, and therewith died. *C. Aufidius* was gotten forth of his house, and as he was going to the Senat, stumbled with his foot in the Comitium or common place of assemblies, and died in the place. Moreouer, a certain Embassador of the Rhodians, who had to the great admiration of all that were present, pleaded their cause before the Senat, in the very entry of the Councill house, as he was going forth, fell downe dead and neuer spake word. *Cn. Babius Pamphilus*, who had bin Pretor, died suddenly as he was asking a boy what it was a clocke. *A. Pompeius*, so soon as he had worshipped the gods in the Capitoll, and said his Orafons, immediately died. So did *M. Inuentius Talsa* the Confull, as hee was offering sacrifice. And *Caius Scribanius Pansa*, as hee stood at a shop in the market place about eight of the clocke in the morning, leaning vpon his brother *P. Pansa* his shoulders. *Babius* the Iudge, as hee was adorning

ning the day of ones appearance in the court. *M. Terentius Corax*, whiles he was writing letters in the market place. No longer since than the very last ycare, a Knight of Rome, as hee was talking with another that had been Consul, and rounding him in the care, fell downe starke dead. And this hapned before the yorie statue of *Apollo*, which stands in the Forum of *Augustus*. But about all others it is strange, that *C. Iulius* a Surgeon should die as he was dressing of a fore eie with a salve, and drawing his instrument along the eye. What should I say of *L. Manlius Torquatus*, a man who had bin sometime Consul, whose hap was to die sitting at supper, even in reaching for a cake or wafer vpon the boord. *L. Durus Valla* the physition died whiles he was drinking a potion of mede or sweet honied wine. *Appius Aufeius* being come out of the Baine, after he had drunk a draught of honied wine, as he was supping off a rere egge died. *P. Quintius Scapula* as he was at supper in *Aquillius Gallus* his house. *Decimus Sauscius* the Scribe, as he sate at dinner in his owne house. *Cornelius Gallus*, one who had bin Lord Pretor, and *T. Aetherius* a Roman Knight, died both in the very act of *Venus*, whiles they lay vpon women. The like befell in our daies to two gentlemen of Rome, who died both as they were dealing contrary to nature with one and the same counterfeite lester named *Mithycus*, a youth in those daies of surpassing beauty. But of all others, *M. Ofilius Hilarius*, an actor and plaier in comedies, as it is reported by antient writers, died most secure of death, & with the greatest circumstances about it: for after he had much delighted the people, & made them sport to their contentment on his birth day, he kept a feast at home in his house; and when supper was set forth vpon the table, hee called for a messe of hot broth in a pottinger to drinke off; and withall casting his eye vpon the maske or visor he put on that day, fitted it for his visage, and tooke off the chaplet or garland from his bare head, and set it thereupon: in this habit, disguised as he sate, hee was starke dead and key cold before any man perceiued it: vntill he that leaned next vnto him at the boord put him in minde of his portage that it cooled, and making no answer, they found in what case he was.

These examples all be of happy deaths: but contrariwise there be an infinite number that are as miserable & vnfortunat. *L. Domitius*, a man descended of a most noble house and parentage, being vanquished by *Cesar* before *Marseils*, and taken prisoner at *Corfinium* by the same *Cesar*; for very irksomnesse of his tedious life, poisoned himselfe: but after he had drunke the poison, repented of that which he had done, and did all that euer hee could to liue still, but in vaine. We finde vpon record in the publike registers, that when *Felix* one of the carnation or flesh-coloured liuery that ranne with chariots in the great cirque or shew-place was had forth dead to be burnt, one of his fauorits and consorts flung himselfe into his funerall fire for company. A friuolous and small matter it is to speak of; but they of the other part that sided with the aduerser faction of other liueries, because this act should not turne to the honor and credit of their concurrent the actiue Chariotier about named, gaue it out and said, that this his friend and wel-willer did not do it for any loue he bare him, but that his head was intoxicate with the strong fauor of the incense and odors that were in the fire, and so being beside himselfe, wist not what he did. Not long before this chanced, *M. Lepidus*, a gentleman of Rome descended of a most noble family, who (as is aboue said) died for thought and grieve of heart that hee had diuorced his wife, was by the violent force of the flame cast forth of the funerall fire; & because of the extreme heat thereof, no man could come neere to lay his corps again in the place where it was & should be: they were faine to make another fire hard by of dry vine cuttings, and such like sticks, and so he was burnt bare and naked as he was.

CHAP. LIIII.

¶ Of Buriall or Sepulture.

To burne the bodies of the dead hath bin no antient custome among the Romans: the manner was in old time to inter them. But after they were giuen once to vnderstand, that the corpes of men slain in the wars afar off, and buried in those parts, were taken forth of the earth again, ordained it was to burne them. And yet many families kept them still to the old guise and ceremonie of committing their dead to the earth: as namely the house of the *Cornelii*, whereof there was not one by report burned before *L. Sylla* the Dictator, and he willed it expressly, and provided for it before hand, for feare himselfe should be so serued as *C. Marius* was, whose corps he caused to be digged vp after it was buried. Now in Latine he is said to be

A be *Sepultus*, that is bestowed or buried any way, it makes no matter how: but *humatus* properly, who is interred only, or committed to the earth.

CHAP. LV.

¶ Of the Ghosts, or spirits of men departed.

After men are buried, great diuersitie there is in opinion, what is become of their souls & ghosts, wandering some this way, and others that. But this is generally held, that in what estate they were before men were born, in the same they remain when they are dead. For neither body nor soule hath any more sence after our dying day, than they had before the day of our natiuitie. But such is the folly & vanitie of men, that it extendeth stil euen to the future time; yea, and in the very time of death flattereth it selfe with fond imaginations, and dreaming of I know not what life after this: for some attribute immortality to the soule: others deuise a certain transfiguration therof; & there be again who suppose, that the ghosts sequestred from the body, haue sence, whereupon they do them honour and worship, making a god of him that is not so much as a man. As if the maner of mens breathing differed from that in other liuing creatures, or as if there were not to be found many other things in the World, that liue much longer than men, and yet no man iudgeth in them the like immortality. But shew me what is the substance and body as it were of the soule by it selfe? what kind of matter is it apart from the body? where lieth her cogitation that she hath? how is her seeing, how is her hearing performed? what toucheth she? nay, what doth she at all? How is she employed? or if there be in her none of all this, what goodnesse can there be without the same? But I would know where shee seeth and hath her abiding place after her departure from the body? and what an infinit multitude of souls like shadows would there be, in so many ages, as well past as to come? how surely these be but fantastical, toolish, and childish toies, deuised by men that would faine liue alwaies, and neuer make an end. The like foolery there is in preferuing the bodies of dead men: & the vanity of *Democritus* is no lesse, who promised a resurrection thereof, and yet himselfe could neuer rise again. And what a folly is this of all follies to thinke (in a mischief) that death should be the way to a second life? what repose and rest should euer men haue that are borne of a woman, if their souls should remain in heauen aboue with sence, whiles their shadows tarried beneath among the infernall wights? Certes, these sweet inducements and pleasing persuasions, this foolish credulitie and light beliefe, marreth the benefit of the best gift of Nature, to wit, Death, it doubleth besides the paine of a man that is to die, if he happen to thinke and consider what shall betide him the time to come. For if it be sweet and pleasant to liue, what pleasure and contentment can one haue, that hath once liued, and now doth not. But how much more ease and greater securitie were it for each man to beleue himselfe in this point, to gather reasons, and to ground his resolution and assurance vpon the experience that he had before hee was borne.

CHAP. LVI.

¶ The first inuentors of diuers things.

Before we depart from this discourse of mens nature, me thinks it were meet and convenient to shew their sundry inuentions, and what each man hath deuised in this world. In the first place, prince *Bacchus* brought vp buying and selling: he it was also that deuised the diadem that royall ensigne and ornament, and the manner of triumph. Dame *Ceres* was the first that shewed the way of sowing corne, whereas before-time men liued of mast. She taught also how to grind corne, to knead dough, and make bread thereof, in the land of Attica, Italy, and Sicily; for which benefit to mankind, reputed she was a goddesse. She it was that beganne to make lawes, how soeuer others haue thought, that *Rhadamantus* was the first law giuer. As for Letters, I am of opinion, that they were in Assyria from the beginning time out of mind; but some thinke, and namely *Gellius*, that they were deuised by *Mercurie* in Egypt: but others say they came first from Syria. True it is that *Cadmus* brought with him into Greece from Phoenice to the number of sixteen, vnto which, *Palamedes* in the time of the Trojan war added foure more in these characters following, *ϕ*, *χ*, *ξ*, *ο*. And after him *Simonides Melicus* came with other foure;

four, to wit, *z. h. t. a.* the force of all which letters we acknowledge and see evidently expressed in our Latine Alphabet. *Aristotle* is rather of mind, that there were 18 letters in the Greeke Alphabet from the beginning, namely, *α. β. γ. δ. ε. ζ. η. θ. ι. κ. λ. μ. ν. ο. π. ρ. σ. τ. θ.* and that the other two *ϕ.* and *χ.* were set to by *Epicharmus*, and not by *Palamedes*. *Anticlidus* writeth, That one in Egypt named *Menon*, was the inventor of letters, fifteene yeares before the time of *Phoroneus*, the most antient king of Greece; and he goeth about to proue the same by antient records and monuments out of histories. Contrariwise, *Epigenes*, an author as renowned, and of as good credit as any other, sheweth, That among the Babylonians there were found Ephemerides containing the obseruation of the stars, for 720 yeares, written in bricks and tiles: and they that speake of least, to wit, *Berosus* and *Critodemus*, report the like for 480 yeares. Whereby it appeareth evidently, that letters were alwaies in vse, time out of mind. The first that brought the Alphabet into Latium or Italy, were the Pelasgians. *Euryalus* and *Hyperbus*, two brethren at Athens, caused the first bricke and tile-kils, yea, and houses thereof to be made: whereas before their time men dwelt in holes and caues within the ground. *Gellius* is of opinion, that *Dexius* the sonne of *Calus*, deuised the first houses that were made of earth and cley: taking his patterne from Swallows and Martins nests. *Cecrops* founded the first towne that euer was, and called it after his owne name Cecropia: which at this day is the castle or citadell in Athens. Some will haue that Argos was built before it, by king *Phoroneus*. And others againe, that Sydicne was before them both. And the Egyptians affirme, That long before that, their city Diospolis was founded. *Cinyra*, the sonne of *Agriopa* deuised tiling and slating of houses first, as also found out the brasie mines, both within the Ile Cyprus. He inuented also pinsers, hammers, yron croiues, and the Anvil or Stithe. *Danaus* sunk the first pits for wells in Greece, which then was called Argos Dipfion; & sailed out of Egypt thither, for that purpose. *Cadmus* at Thebes (or, as *Theophrastus* saith) in Phoenice, found out stone quarries first. *Thraso* was the first builder of towne walls: of towers & fortresses, the Cyclops, as *Aristotle* thinketh: but the Tyrrinthians according to *Theophrastus*. Weauing was the inuention of the Egyptians: and dying wool, of the Lydians in Sardis. *Closter* the son of *Arachne* taught the first making of the spindle for woollen yeare: and *Arachne* her selfe was the first spinner of flax thred, the weauer of linnen, and of nets. *Niceas* the Megarean deuised the fullers craft. *Boethius* shewed the art of sowing, as wel for tailors as Corviners and shoemakers. The Egyptians would haue the skill of physicke to haue bin first among them: but others affirme, That *Arabus* the son of *Babylon* & *Apollo*, was the author thereof. The first Herbarist and Apothecarie, renowned for the knowledge of simples, & composition of medicines, was *Chiron*, son of *Saturne* & *Phyllira*. *Aristotle* thinketh, that *Lydus* the Scythian taught the feat of casting and melting brasie, with the tempering also of the same: howbeit, *Theophrastus* saith it was *Delas* the Phrygian. As for the forges & furnaces of brasie, some think the Chalypes deuised, others attribute that to the Cyclopes. The discovery of the yron and steel mines, as also the working in them, was the inuention (as *Hesiodus* saith) of those in Crete, who were called Daetyli Idæi. Likewise of siluer, *Erichthonius* the Athenian beareth the name, or (after some) *Acacus*. The gold mines, together with the melting and trying thereof, *Cadmus* the Phoenician first found out neere the mountain Pangæus: but there be that giue the praise hereof to *Thoas* & *Acacis* in Panchaia: or els to *Sol* the son of *Oceanus*, to whom *Gellius* attributeth the inuention of Physick, and making hony. *Midacritus* was the first man that brought lead out of the Island Cassiteris. And the Cyclopes inuented first the yron-smiths forge. *Corabus* the Athenian deuised the potters craft, shewing how to cast earthen vessels in moulds, & bake them in furnaces. And therein, *Anacharsis* the Scythian, or after some, *Hyperbius* the Corinthian, inuented the cast of turning the roundel or globe. Carpenters art was the inuention of *Dedalus*, as also the tools thereto belonging, to wit, the saw, the chip-axe, and hatchet, the plumb line, the auger and wimble, the strong glew, as also fish-glew, and stone. Saudre. As for the rule & square, the leuell, the turners instrument, and the key, *Theodorus Samius* deuised them. *Phidon* the Argiue, or *Palamedes* as *Gellius* rather thinketh, found out measures and weights. *Pyrodes* the son of *Cilix*, deuised the way to strike fire first out of the flint, and *Prometheus*, the means to preferue & keep it in a stalke of *Ferula*, or Fennell gyant. The Phrygians inuented first the wagon & chariot with foure wheeles. As for trafficke and merchandise, the Carthaginians had the first honour thereof. *Eumolpus* the Athenian was of name for planting, pruning, and cutting vines: also for setting and grafting trees. *Staphylus* the sonne of *Silenus* taught men how to delay wine with

A with water. *Aristeus* the Athenian inuented the making of oyle oliue, as also the presse & mill thereto belonging. The same man taught the cast of drawing hony out of the combs. *Buzyges* the Athenian, or as others would haue it, *Triptolemus*, yoked oxen first for tillage of the ground, and deuised the plough. The Egyptians were the first of al men that were gouerned by the monarchy, and the Athenians, by a popular state. After the reigne of *Theseus*, the first king or tyrant was *Phalaris*, at Agrigentum in Sicily. The Lacedæmonians brought in bondage and slavery, first. The first judgement that passed for life and death, was in the court Ariopagus at Athens. The first battell that euer was fought, was between the Africanes and Egyptians, & the same performed by bastons, clubs, & coulstaues, which they call Phalangæ. Shields, bucklers, and targets were deuised by *Pratus* and *Anisus*, when they warred one against the other: or els by *Calchus* the son of *Athamas*. *Midias* of Messene made the first cuirace. And the Lacedæmonians, the mourian, the sword, and the speare. The Carians deuised the grieues, the crests, and pennaches vpon helmets. *Scythes* the son of *Iupiter*, deuised bow & arrowes: although some say that *Perfus* the son of *Perfus* inuented arrows. The Ætolians inuented the lance and the pike: the dart with a loup, *Atolus* the son of *Mars*, deuised. As for the light iauelins, and the Partuisanes, *Tyrrhenus* brought them first into vse: & *Penthesilea* the Amazon-queene, the gleiue, bill, battell-axe, and halbard. *Piscus* found out the bore-speare and chasing staffe. Among engines of artillery, the Cretes inuented the Scorpion or crosse-bow: the Syrians, the Catapult: the Phoenicians the balist or brake, and the sling. *Pyseus* the Tyrrhenian brought vp the vse of the brasen trumpet: and *Arctonon Clozomenius* of the pauois, mantlets, targuet-roofs, for the assault of cities. The engine to batter walls (called sometime the horse, and now is named the ram) was the deuise of *Epeus* at Troy. *Bellerophon* shewed first how to ride on horseback. *Pelethronius* inuented saddle, bridle, and other furniture for the horse. The Thessalians called Centaures, inhabiting neere to the mountain Pelius, were the first that fought on horseback. The Phrygians deuised first to driue and draw a chariot with two horses; *Erichthonius*, with foure. *Palamedes* inuented (during the Trojan war) the manner of setting an army in battell array: also the giuing of signall, the priue watch-word, the Corps de guard, the watch and ward. In the time of the said war, *Sinon* deuised the sentinels and watch-towers, as also the espiall. *Lycanor* was the first maker of truce. *Theseus* of leagues and alliances. *Car*, of whom Caria tooke the name, obserued first the flight and cry of birds, and thereby gaue presages and fore-tokens. *Orpheus* went farther in this skill, and tooke marks from other beasts. *Dolphus* pried into beasts inwards, and thereby foretold things to come. *Amphiarus* was the first that had knowledge in Pyromancie, & gathered signs by speculation of fire: like as *Tyresias* the Thebane, by the feeding and gesture of birds. *Amphichyon* gaue the interpretation of strange and prodigious sights, as also of dreames. *Atlas* the son of *Libya* (or as some say, the Egyptians; & as others, the Assyrians) inuented Astrology: & in that science *Anaximander* deuised the Sphere. As for the knowledge & destination of the winds *Aeolus* the son of *Hellen*, he professed it first. *Amphion* brought musicke first into the world. The flute and the single pipe or recorder were the inuentions of *Pan*, the son of *Mercurie*. The crooked cornet, *Midias* in Phrygia deuised. And in the same country, *Marsyas* inuented the double fluit. But *Amphion* taught first to sing and play to the Lydian measures: *Thamyras* the Thracian to the Dorian: and *Marsyas* of Phrygia to the Phrygian. *Amphion* likewise (or, as some say, *Orpheus*, and after others *Linus*) plaied first vpon the Citterne or the Lute. *Terpander* put seuen strings more vnto it. *Simonides* added thereto an eight: and *Timotheus* the ninth. *Thamyras* was the first that plaied vpon the stringed instrument, Lute Cittern, or harpe, without song: & *Amphion* sung withal, or according to some, *Linus*. *Terpander* was the first that set songs for the foresaid stringed instrument. And *Dardanius* the Træezenian began first vocall musicke to the pipe. The Curets taught to daunce in armour; and *Pyrrhus* the Morisk, in order of battell: and both these were taken vp first in Crete. The heroick or hexametre verse we acknowledge to haue come first from the Oracle of *Pythius Apollo*. But about the original of Poemes & Poetry, there is a great question among authors. And it is probably gathered by histories, that there were Poets before the time of this Trojan war. *Pherecides* of Syros, in the daies of king *Cyrus*, inuented first the writing in prose. *Cadmus* the Milesian wrote Chronicles, and compiled the first history; *Lycan* hath the report of setting out the first publicke games, and prouing of masteries & feats of strength of actiuiity, in Arcadia. To *Acastus* in Iolcum we are beholden for the first solemnities and games at funerals: and after him to *Theseus*, in the streights of Isthmus. *Hercules* instituted

instituted the exercise of wrestlers and champions at Olympia: and *Pythius* was the first plaier at tennis. *Gyges* the Lydian gaue the first prooue of painting and limning, in *Egypt*: but in Greece, *Busiris* a cousin of *Dadalus* was the first painter, as *Aristotle* supposeth; but after *Theophrastus*, it was *Polygnotus* the Athenian. *Danaus* was the first that sailed with a ship, and so he passed the seas from *Egypt* to Greece; for before that time they vsed but troughs or flat planks, deuised by *K. Erythra* to crosse from one Island to another in the red sea. But we meet with some writers who affirme, that the Troians and Mysians were the first sailers, and deuised nauigation before them in *Hellepont*, when they set out a voiage against the Thracians. And euen at this day in the British ocean, there be made certaine wicker boats of twigs couered with lether and stitched round about: in Nilus, of paper, cane-reed and rushes. *Philostephanus* witnesseth, that *Iason* first vsed the long ship or gally: but *Egeas* saith, that it was *Paralus*: *Ctesias* attributes it to *Samyra*; *Saphanas* to *Semyramis*: and *Archimachus*, to *Aegon*. *Damastes* testifieth, that the *Erythraians* made the Bireme or gally with two banks of oares. *Thucydides* writeth that *Aminocles* the Corinthian built the first Trireme with three rows of oars to a side. *Aristotle* saith, that the Carthaginians were the first that set to sea the Quadrireme with 4 ranks of oares to a side: and *Nesichton* the Salaminian, set afloat the first Quinquereme with 5 course of oares on either side. *Zenagoras* of Syracusa brought vp those of six; and so from it to those of ten, *Mnesigeon* was the inuenter. It is said, that *Alexander* the Great built gallies for 12 bankes to a side: and *Philostephanus* reporteth, that *Ptolema* surnamed *Soter*, rose to fifteen: *Demetrius* the son of *Antigonus*, to thirty; *Ptolome Philadelphus*, to forty: and *Ptolome Philopator* surnamed *Tryphon*, to fifty. As for ships of burthen and merchandise, as hoyes, &c. *Hippus Tyrius* inuented them. The Cyrenians made fregates; the Phoenicians, the bark; the Rhodians, the Pinace and Brigantine: and last of all the Cyprians made the hulke and great carrack. The Phoenicians were the first that in sailing, obserued the course of the stars. The Copeans deuised the oare: the Plateans inuented the broad and flat end thereof: *Icarus* the sailes: *Dadalus* the mast and the crosse saile-yard. The vessels for transporting of horses, were the inuention of the Samians, or else of *Pericles* the Athenien. The Thasij had the honour for framing the long ships couered with hatch: for before-time they fought only from out of the hin-decke in the poupe, and the fore-castle in the proe. Then came *Pisens* the Tyrrhene, and armed the stem and beake-head of the shippe with sharpe tines and pikes of brasse: *Eupalamus* deuised the anchor: *Anacharsis* made it first with two teeth or floukes: the grappling hookes and the yron hands were the deuise of *Pericles* the Athenien; and finally, *Typhis* inuented the help of the helme, for the Pilot to steere & rule the ship. The first that set out an Armada to the sea for fight was *Minos*. The first that killed beasts was *Hyperbius* the son of *Mars*: and *Prometheus* ventured to slay an ox or a Bœufe.

CHAP. LVII.

¶ Wherein appeared first the generall agreement of all Nations.

The secret consent of all countries was shewed first in this, That they should vniuersally in all places vse the Ionian letters.

CHAP. LVIII.

¶ Of Antique Letters.

The old characters of Greeke letters, were the same in manner that the Latine be in these daies; and this appeareth sufficiently by an antique table of brasse which came from the temple at Delphos, the which at this day is in the great library of the Palatium dedicated to *Minerva*, by the liberality of the Emperors, with this or such like inscription vpon it, *Ναυσιφάνης τῆς πόλεως Ἀθηναίων, ἡμετέρας, Ναυσικράτης* (the son) of *Tisamenus* an Athenien, caused this table to be made and set vp to the noble virgin *Minerva*.

CHAP. LIX.

¶ When Barbers were first scene at Rome.

The next thing that all people of the world agreed in, was to entertain Barbers, but it was late first ere they were in any request at Rome. The first that entered Italy came out of Sicillie, and it was in the 454 yeare after the foundation of Rome. Brought in they were by

A by *P. Titinius Mena*, as *Varro* doth report; for before-time they neuer cut their haire. The first that was shauen euery day was *Scipio Africanus*; and after him commeth *Augustus* the Emperour, who euermore vsed the razor.

CHAP. LX.

¶ Of Horologies or Dials, when they were first deuised.

The third vniuersal accord of all nations, was in the obseruation how the houres went; and this was a point grounded vpon good reason: but at what time, and by whom this was deuised in Greece, we haue declared in the second booke of this work; & long it was before this order came vp at Rome, as well as the vse of the Barber. In the 12 tables of Romane lawes, there is no mention at all made but of East and West; after certain yeres the noon-stead point in the South quarter also was obserued, and the Consuls bedle or crier pronounced noon, when standing at the hall or chamber of the councill, he beheld the Sun in that wise betwene the pulpit called *Rostra*, and the *Grecostasis* which was a place where forein embassadours gaue their attendance: but when that the same sun inclined downward from the column named *Mœnia*, to the common gaole or prison, then he gaue warning of the last quarter of the day, and so pronounced. But this obseruation would serue but vpon cleere daies, when the sun shined: and yet there was no other means to know how the day went, vntill the first Punicke war. *Fabius Vellatilis* writeth, that *L. Papyrius Cursor*, 12 yeres before the war with *Pyrrhus*, was the first, that for to do the Romans a pleasure, set vp a sun-dyall to know what it was a clocke, vpon the temple of *Quirinus* at the dedication thereof, when his father had vowed it before him. Howbeit mine author sheweth not either the reason of the making of that diall, or the workman; ne yet from whence it was brought, nor in what writer he found it so written. *M. Varro* reporteth, that the first diall was set vp in the common market place, vpon a columne neere the foresaid *Rostra*, in the time of the first Punicke war, by *M. Valerius Messala* the Consull, presently after the taking of Catana in Sicily; from whence it was brought; thirty yeares after the report that goeth of the foresaid quadrant and diall of *Papyrius*; namely, in the yeare after the foundation of the city 477. And albeit the strokes and lines of this Horologe or diall agreed not fit with the houres, yet were the people ruled and went by it for an hundred yeares saue one, euen vntill *Q. Martius Philippus* (who together with *L. Papius* was Censor) set another by it, framed & made more exquisitly according to Art. And this piece of work among other good acts done by the Censor during his office, was highly accepted of the people as a singular gift of his. Yet for all this, if it were a close and cloudy day wherein the Sun shone not out, men knew not what it was a clocke certainly; and thus it continued fve yeres more. Then at last, *Scipio Nasica* being Censor with *Lenas*, made the deuise first to diuide the houres both of day and night equally, by water, distilling and dropping out one vessell into another. And this manner of Horologe or water-clocke, he dedicated in the end within house, and that was in the 595 yere from the building of Rome. Thus you see how long it was, that the people of Rome could not certainly tell how the day passed. Thus much concerning the Nature of man: let vs returne now to discourse of other liuing creatures; and first of land-beasts.

THE EIGHTH BOOKE OF
THE HISTORIE OF NATVRE,
WRITTEN BY C. PLINIVS
SECVNDVS.

CHAP. I.

¶ *Of landbeasts. The praise of Elephants: their wit and understanding.*

Asse we now to treat of other liuing creatures, and first of land-beasts: among which, the Elephant is the greatest, and commeth neereft in wit and capacitie, to men; for they vnderstand the language of that country wherein they are bred, they do whatsoeuer they are commanded, they remember what duties they be taught, and withall take a pleasure and delight both in loue and also in glory, nay more than all this, they embrace goodnesse, honestie, prudence, and equitie (rare qualities I may tel you to be found in men) and withall haue in religious reuerence (with a kinde of deuotion) not only the stars and planets, but the sun and moon they also worship. And in very truth, writers there be who report thus much of them, That when the new moon beginneth to appeare fresh and bright, they come downe by whole heards to a certaine riuer named Amelus, in the desarts and forests of Mauritania, where after that they are washed and solemnly purified by sprinkling and dashing themselves all ouer with the water, & haue saluted and adored after their manner that planet, they returne again into the woods & chafes, carrying before them their yong calues that be wearied and tired. Moreover, they are thought to haue a sense and vnderstanding of religion & conscience in others; for when they are to passe the seas into another country, they wil not embarke before they be induced thereto by an oath of their gouernors and rulers, That they shall returne again: and seene there haue bin diuers of them, being enfeebl'd by sicknesse (for as big and huge as they be, subject they are to grievous maladies) to lie vpon their backs, casting and flinging herbes vp toward heauen, as if they had procured and set the earth to pray for them. Now for their docility and aptnesse to learne any thing, the king they adore, they kneele before him, and offer vnto him garlands and chaplers of floures and green herbes. To conclude, the lesser sort of them, which they call Bastards, serue the Indians in good stead to eare and plough their ground.

CHAP. II.

¶ *When Elephants were put to draw first.*

The first time that euer they were knowne to draw at Rome, was in the triumph of Pompey the Great, after he had subdued Africke, for then were two of them put in geeres to his triumphant chariot. But long before that, it is said that Father Bacchus hauing conquered India, did the like when he triumphed for his conquest. Howbeit, in that triumph of Pompey, Procilius affirmeth, That coupled, as they were, two in one yoke, they could not possibly go in at the gates of Rome. In the late solemnity of tournois & sword-fight at the sharp, which Germanicus Caesar exhibited to gratifie the people, the elephants were seen to shew pastime with leaping & keeping a stir, as if they danced, after a rude and disorderly manner. A common thing it was

A was among them to sling weapons & darts in the aire so strongly, that the winds had no power against them; to flourish also before hand; yea, and to encounter and meet together in fight like sword-fencers; and to make good sport in a kinde of Moriske dance: and afterwards to go on ropes and cords: to carry (foure together) one of them laid at ease in a litter, resembling the manner of women newly brought a bed: last of all, some of them were so nimble and well practised, that they would enter into an hall or dining place where the tables were set full of guests, and passe among them so gently and daintily, weighing as it were their feet in their going, so as they would not hurt or touch any of the company as they were drinking.

CHAP. III.

¶ *The docilitie of Elephants.*

This is knowne for certaine, that vpon a time there was an Elephant among the rest, not so good of capacity, to take out his lessons, and learn that which was taught him: and being beaten and beaten again for that blockish and dull head of his, was found studying and conning those feats in the night, which he had bin learning in the day time. But one of the greatest wonders of them was this, that they could mount vp and clime against a rope, but more wonderfull, that they should slide downe again with their heads downward. Mutianus, a man who had in his time bin thrice Consul, reporteth thus much of one of them, that he had learned to make the Greeke characters, and was wont to write in that language thus much, *Thine haue I written, and made an offering of the Celicke spoiles.* Likewise hee saith, that himselfe saw at Puteoli, a certain ship discharged of Elephants embarked therein; and when they should be set ashore, and forced to go forth of the vessel, to which purpose there was a bridge made for them to passe ouer, they were affrighted at the length thereof, bearing out so far from the land into the water: and therefore to deceiue themselves, that the way might not seeme so long, went backward with their tails to the banke, and their heads toward the sea. They are ware, & know full well that their only riches (for loue of which, men lay wait for them) lieth in their armes and weapons that Nature hath giuen them: king Iuba calleth them their horns: but Herodotus, who wrote long before him, and the custome of speech, hath rearmed them much better, teeth. And therefore when they are shed and fallen off, either for age, or by some casualtie, the Elephants themselves hide them within the ground. And this in truth is the only yuory: for all the rest, yea, and these teeth also so far as lay couered within the flesh, is of no price, and taken for no better than bone. And yet of late daies, for great scarcitie & want of the right teeth, men haue bin glad to cut and saw their bones into plates, and make yvorie therof. For hardly can we now come by teeth of any bignes, vnlesse we haue them out of India. For all the rest that might be gotten in this part of the world between vs and them, hath bin imployed in superfluities only, and serued for wanton roies. You may know yong Elephants by the whiteness of these teeth: and a specjall care and regard haue these beasts of them about all. They looke to one of them alwaies, that the point be sharp, and therefore they forbear to occupie it, least it should bee blunt against they come to fight: the other they vse ordinarily, either to get vp roots out of the earth, or to cast down any banks or mures that stand in their way. When they chance to be enuironed and compassed round about with hunters, they set formost in the rank to be seen, those of the heard that haue the least teeth: to the end, that their price might not be thought worthy the hazard and venture in chafe for them. But afterwards, when they see the hunters eager, and themselves ouermatched and weary, they breake them with running against the hard trees, and leaving them behind, escape by this ranfome as it were, out of their hands.

CHAP. IIII.

¶ *The clemencie of Elephants: their foresight and knowledge of their owne dangers: also the fell fiercenesse of the Tygre.*

A Wonder it is in many of these creatures, that they should thus know wherefore they are hunted, and withall take heed & beware of all their dangers. It is said, that if an elephant chance to meet with a man wandering simply out of his way in the wilderness, hee will mildly and gently set him in the right way again. But if he perceiue a mans fresh footing, before he espie the man, he will quake and tremble for feare of being forelaid & surpris'd: he wil stay

stay from farther following the sent, look about him euery way, snuffe and puffle for very anger. Neither will he tread vpon the tract of a mans foot, but dig it out of the earth, and giue it the next Elephant vnto him, and he againe to him that followeth, and so from one to another passeth this intelligence and message as it were, to the vtmost rank behind. Then the whole heard makes a stand, and cast round about to returne backward, and withall put themselves in battell array: so long continueth that strong virulent smel of mens feet, and runneth through them all, notwithstanding for the most part they be not bare but shod. Semblably, the Tigresse also, how fierce and cruell she be to other wilde beasts, & careth not a whit for a very Elephant; if shee happen to haue a sight of a mans footing, presently, by report, carieth away her young whelpes, and is gon. But how commeth she to this knowledge of a man? where saw she him euer before, whom thus she feareth? for surely such wild woods & forests are not much trauelled & frequented by men. Set case, that they may wel wonder at the strange sight and nouelty of their tracts, which are so seldome seen, how know they that they are to be feared? Nay, what should be the reason, that they dread to see a man indeed, being as they are, far bigger, much stronger, and swifter by many degrees than a man? Certes, herein is to be seen the wonderfull worke of Nature, and her mightie power; that the greatest, the most fell and sauage beasts that be, hauing neuer seen that which they ought to feare, should incontinently haue the sence and conceit, why the same is to be feared.

CHAP. V.

¶ The vnderstanding and memorie of Elephants.

THe Elephants march alwaies in troups. The eldest of them leadeth the vaward, like a captain: and the next to him in age, commeth behind with the conduct of the arrereguard. When they are to passe ouer any riuer, they put for most the least of al their company, for feare, that if the bigger should enter first, they would, as they trod in the channell, make the water to swell and rise, and so cause the foud to be more deepe. *Antipater* writeth, that *K. Antiochus* had two Elephants, which he vsed in his wars aboue all the rest, and famous they were for their surnames, which they knew well enough, and wist when any man called them thereby: and verily, *Cato* reciting in his Annals the names of the principall capitaine Elephants, hath left in writing, That the Elephant which fought most lustily in the point of the Punick war, had to name Surus, by the same token, that the one of his teeth was gone. When *Antiochus* on a time would haue founded the foud of a certaine riuer, by putting the Elephants before, *Ajax* refused to take the water, who otherwise at all times was wont to lead the way. Whereupon the king pronounced with a loud voice, That look which Elephant passed to the other side, he should be the captain and chiefe. Then *Patroclus* gaue the venture: & for his labor had a rich harness and caparison giuen him; & was all trapped in siluer (a thing wherein they take most delight) and made besides the foueraigne of all the rest. But the other that was disgraced thus, and had lost his place, would neuer eat any meat after, but died for very shame of such a reprochfull ignominy. For among other qualities, maruellous bashfull they are: for if one of them be ouermatched & vanquished in fight, he wil neuer after abide the voice & braying of the conqueror, but in token of submission, giueth him a turfe of earth, with veruaine or grasse vpon it. Vpon a kind of shamefaced modesty, they neuer are seen to ingender together, but perform that act in some couert & secret corner. They go to rut, the male at 5 yeres of age, the femal not before she is 10 yeres old. And this they do euery third yere: and they continue therein fve daies in the yere (as they say) and not aboue: for vpon the sixt day they all to wash themselves ouer in the running riuer: & before they be thus purified, return not to the heard. After they haue taken one to another once, they neuer change: neither fall they out and fight about their femalls, as other creatures do most deadly and mortally. And this is not for want of loue and hot affection that way: for reported it is of one Elephant, that he cast a fancy and was enamoured vpon a wench in *Aegypt* that sold nosogaies & garlands of floures. And lest any man should thinke that hee had no reason thereto, it was no ordinary maiden, but so amiable, as that *Aristophanes* the excellent Grammarian, was wonderfully in loue with her. Another there was, so kind and full of loue, that he fancied a youth in the army of *Protopaus*, that scarce had neuer an haire vpon his face, and so entirely he loued him, that what day soeuer he saw him not, he would forebare his meat.

A meat, and eat nothing. *K. Iuba* likewise reporteth also of an Elephant that made court to another woman, who made and sold sweet ointments and perfumes. All these testified their loue and kindnes, by these tokens: joy they would at the sight of them, and looke pleasantly vpon them: make toward them they would (after their rude and homely manner) by all means of flatterie: and especially in this, that they would saue whatsoeuer people cast to them for to eat, and lay the same full kindly in their laps and bosomes. But no maruel it is that they should loue who are so good of memorie. For the same *Iuba* saith, That an Elephant tooke knowledge and acquaintance of one man in his old age, and after many a yere, who in his youth had bin his ruler and governor. He affirmeth also, that they haue by a secret diuine instinct, a certain sence of justice and righteous dealing. For when *K. Bacchus* meant to be reuenged of 30 Elephants, that he had caused to be bound vnto stakes, and set other 30 to run vpon them, appointing also certain men among to pricke and prouoke them thereto, yet for all that, could not one of them be brought for to execute this butcherie, nor be ministers of anothers crueltie.

CHAP. VI.

¶ When Elephants were first seen in Italy.

THe first time that Elephants were seen in Italy, was during the war of *K. Pyrrhus*, & they called them by the name of *Lucae boues*, i. Lucane oxen, because they had the first sight of them in the Lucans countrie, and it was in the 472 yere after the cities foundation. But in Rome it was seuen yeres after ere they were seen, and then they were shewed in a triumph. But in the yere 502, a number of them were seen at Rome by occasion of the victorie of *L. Metellus Pontifex* ouer the Carthaginians: which Elephants were taken in Sicilie. For 14 of them were conueied ouer vpon planks and flat bottomes, which were laied vpon ranks of great tuns and pipes set thicke one by another. *Verrius* saith, that they were caused to fight in the great cirque or shew place, and were killed there with shot of darts and iauelins for want of better counsel, and because they knew not well what to do with them: for neither were they willing to haue them kept and nourished, ne yet to be bestowed vpon any kings. *L. Piso* saith they were brought out only into the shew place or cirque aforesaid, and for to make them more contemptible were chased round about it by certaine fellows hired thereto, hauing for that purpose certain stauces and perches, not pointed with iron, but headed with bals like foiles. But what became of them afterward, those Authours make no mention: who were of opinion that they were not killed.

CHAP. VII.

¶ Their fights and combats.

Much renowned is the fight of one Roman with an Elephant, at what time as *Annibal* forced those captiues whom he had taken of our men, to skirmish one against another to the vtterance. For the only Roman that remained vnslaine at that vnaturall conflict, he would needs match with an Elephant, and see the combat himseife, assuring him vpon his word, that if he could kil the beast, he should be dismissed and sent home with life & liberty. So this prisoner entred into single fight with the Elephant, & to the great hearts griefe of the Carthaginians slew him out-right. *Annibal* then sent him away indeed according to promise and couenant; but considering better the consequence of this matter; and namely, that if this combat were once by him bruted abroad, the beasts would be lesse regarded, and their seruice in the wars not esteemed; made after him certaine light horsemen to ouertake him vpon the way to cut his throat, so making him sure for telling tales. Their long snout or trunk which the Latins call *Proboscis*, may be easily cut off, as it appeared by experience in the wars against *K. Pyrrhus*. *Fenestella* writeth, That the first sight of them in Rome, was exhibited in the grand Cirque, during the time that *Claudius Pulcher* was *Aedile Curule*, when *M. Antonius* and *A. Postumius* were Consuls: in the 650 yere after the citie of Rome was built. In like manner, 20 yeres after, when the *Luculli* were *Aediles Curule*, there was represented a combat between bulls and Elephants. Also in the second Consulship of *C. Pompeius* at the dedication of the temple to *Venus Victorese*, 20 of them, or as some write, 17 fought in the great Cirque. In which solemnitie the

the Gætulians were set to launce darts and jauelins against them. But among all the rest, one Elephant did wonders: for when his legs and feet were shot and sticke full of darts, he crept vpon his knees, and neuer staied til he was gotten among the companies of the said Gætulians, where he caught from them their targets and bucklers perforce, flung them aloft into the aire, which as they fell, turned round, as if they had bin trundled by art, & not hurled & thrown with violence by the beasts in their furious anger: and this made a goodly sight, and did great pleasure to the beholders. And as strange a thing as that was seen in another of them, whose fortune was to be killed out of hand with one shot: for the dart was so driuen, that it entered vnder the eie, and pierced as far as to the vitall parts of the head, euen the ventricles of the brain. Whereupon all the rest at once assaied to break forth and get away, not without a great hurly & trouble among the people, notwithstanding they were without the lists, and those set round about with yron grates and bars. [And for this cause *Cæsar* the Dictatour, when afterwards hee was to exhibit the like shew before the people, cast a ditch round about the place, letting in the water and so made a more thereof: which prince *Nero* afterwards stopped vp, for to make more room for the knights and men of armes.] But those Elephants of *Pompey* being past all hope of escaping and going cleere away, after a most pittifull manner and rufull plight that cannot bee expressed, seemed to make mone vnto the multitude, crauing mercie and pittie, with grievous plaints and lamentations, bewailing their hard state and wofull case: in such sort, that the peoples hearts earned again at this piteous sight, and with tears in their eies, for very compassion, rose vp all at once from beholding this pageant, without regard of the person of *Pompey* that great Generall and Commander, without respect of his magnificence and stately shew, of his munificence and liberality, where he thought to haue woon great applause and honor at their hands; but in lieu thereof fell to cursing of him, and wishing all those plagues and misfortunes to light vpon his head, which soon after infused accordingly. Moreover, *Cæsar* the Dictatour in his third Consulship exhibited another fight of them, and brought forth 20 to maintain skirmish against 500 footmen: and a second time he set out 20 more, with woodden turrets vpon their backs, containing 60 defendants apiece: and he opposed against them 500 footmen, and as many horse. After all this, *Claudius* and *Nero* the Emperors brought them forth one by one into single fight, with approued, expert, and accomplished fencers, at the end of al the other solemnities when they had done their prizes. This beast, by report of all writers, is so gentle to all others that are but weak, and not so strong as himselfe, that if he passe through a flock or heard of smaller cattell, it will with the nose or trunk which serueth in stead of his hand, remoue and turn aside whatsoeuer beast commeth in his way, for feare he should go ouer them, and so crush and tread vnder his foot any of them, ere it were aware. And neuer do they any hurt, vnlesse they be prouoked thereto. Alwaies walke they by troups together, and worst of all other can they away with wandring alone, but loue company exceeding well. If it fortune that they be inuiroined with horsmen, look how many of their fellows be feeble, weary, or wounded, those they take into the mids of their Squadron: and as if there were marshalled and ordered by a Serjeant of a band, or heard the direction of some Generall, so skilfully and as it were with guidance of reason, do they maintain fight by turns, and succeed one after another in their course. The wild sort of them, after they be taken, are soonest brought to be tame and gentle, with the iuice or decoction of husked barley.

CHAP. VIII.

¶ The manner of taking Elephants:

The Indians are wont to take Elephants in this manner: the gouernor driueth one of them that are tame, into the chafe and forrests, and when he can meet with one of them alone, or single him from the heard, he all to beateth the wilde beast till he hath made him wearie, and then he mounterh vpon him & ruleth him as wel as the former. In Africk they catch them in great ditches which they make for that purpose: into which, if one of them chance to wander astray from his fellows, all the rest immediatly come to succour him; they heap together a deale of boughs, they rol down blocks & stones, and whatsoeuer may serue to raise a banke, and with all that euer they can do, labor to plucke him out. Before-time, when they meant to make them tractable, their maner was, by a troupe of horsmen to driue or train them by little & little

a long

- A a long way in a certain lawn or vally, made by mans hand for the nones, ere they were aware, and when they were inclosed within ditches or bankes, there they would keep them from meat so long, vntil for very hunger they would be glad to come to hand for food: & by this they might know they were gentle and tame enough to be taken, if they would meekly take a branch of a bow presented and offered vnto them. But now adaies, since they seek after them for their teeth sake, they make no more ado but shoot at their legges, which otherwise naturally are tender enough and the softest part of their whole body. The Troglodites, a people bounding vpon Æthiopia, who liue only vpon the venison of Elephants flesh, vse to clime trees that be neer their walk, and there take a stand: from thence (letting all the heard to passe quietly vnder the trees) they leap down vpon the buttocks of the hinmost: then he that doth this feat, with his left hand laieth fast hold vpon his taile, and sets his feet and legs fast in the flanke of the left side, and so hanging and bending backward with his body, he cutteth the ham-strings of one of his legges with a good keen bil or hatchet that he hath of purpose in his right hand: which done, the Elephant beginneth to slack his pace, by reason that one of his legs is wounded: the man then maketh shift to get away and alighteth on foot, and for a farwell he hougheth the sinews likewise of the other ham, and all this doth he in a trice with wonderful agility and nimblenes. Others haue a safer way than this, but it is more subtil and deceitfull: they set or stick in the ground a great way off, mighty great bows ready bent; to hold these fast, they chuse certain tal lusty, and strong fellows, and as many others as sufficient as they, to draw with all their might and maine C the said bowes against the other, and so they let flie against the poore Elephants as they passe by, jauelins and bore-spears, as if they shot shafts, and stick them therewith, and so follow them by their blood. Of these beasts, the femals are much more fearfull than the male kind.

CHAP. IX.

¶ The manner of taming Elephants:

- A S furious and raging mad as they be sometime, they are tamed with hunger and stripes; but men had need to haue the help of other Elephants that are tame already, to restraine the vnruely beast with strong chains: of all times, when they go to rut they are most out of order and starke wood; down go the Indian stables and beast stals then, which they ouer-turne with their teeth; and therefore they keepe them from entring into that fit, and separate the femals apart from the males, making their parks and enclosures asunder, as they doe by other beasts. The tamed sort of them serue in the wars, and carry little castles or turrets with armed souldiers, to enter the squadrons and battalions of the enemies: and for the most part, all the seruice in the wars of the East, is performed by them, and they especially determine the quarrell: these be they that breake the ranks, beare down armed men that are in the way, and stampe them vnder foot. These terrible beasts (as outrageous otherwise as they seem) are frightened with the least grunting that is of a swine: be they wounded at any time or put into a fright, backward alwaies they go, and do as much mischief to their own side that way, as to their enemies. E The African Elephants are afraid of the Indian, and dare not look vpon them; for in truth the Indian Elephants be far bigger.

CHAP. X.

¶ How they breed and bring forth their young: and of their nature otherwise.

- The common sort of men thinke, that they go with young ten yeres: but *Aristotle* saith that they go but two yeres, and that they breed but once and no more in their life, and bring not aboue one at a time: also that they liue commonly by course of nature 200 yeres, and some of them 300. Their youthful time and strength of age beginneth when they be 60 yeres old: they loue riuers aboue all things, and lightly ye shall haue them euermore wandring about waters; and yet by reason otherwise of their big and vnwealdie bodies, swim they cannot. Of all things they can worst away with cold, and that is it they are most subiect vnto, and feele greatest inconuenience by: troubled they be also with the collick, and ventosities, as also with the flux of the belly: other maladies they feele nor. I find it written in histories, that if

S 3

they

they drinke oile, the arrows and darts which stick in their bodies wil come forth and fall off : G but the more that they sweat, the sooner wil they take hold and abide in stil the faster. The eating of earth breedes the consumption in them, vnlesse they feed and chew often therof: they deuoure stones also. As for the trunks and bodies of trees, it is the best meat they haue, & therein take they most delight. If the date trees be too high that they cannot reach the fruit, they will ouerturn them with their forehead, and when they lie along, eat the dates. They chew and eat their meat with their mouth: but they breath, drink, and smell, with their trunk, which not improperly is called their hand. Of all other liuing creatures, they cannot abide a mouse or a rat, and if they perceiue that their prouander lying in the manger, tast and sent neuer so little of them, they refuse it and wil not touch it. They are mightily tormented with paine, if they chance in their drinking to swallow down an horleeche (which worm, I obserue, they begin now to call a bloud-sucker:) for so soon as the horleeche hath settled fast in his wind-pipe, he putteth him to intolerable pains. Their hide or skin of their back is most tough & hard, but in the belly, soft & tender: couered their skin is neither with haire nor bristle, no not so much as in their taile, which might serue them in good stead to driue away the busie & troublesome flie (for as vast & huge a beast as he is, the flie hanteth & stingeth him) but full their skin is of crosse wrinkles lattisewise; & besides that, the smell thereof is able to draw and allure such vermin to it: & therefore when they are laid stretched along, and perceiue the flies by whole swarms settled on their skin, suddenly they draw those cranies and creuises together close, and so crush them all to death. This serues them in stead of taile, main, and long haire. Their teeth beare a very high price, and they yeeld the matter of greatest request, and most commendable, for to make the statues and images of the gods: but such is the superfluity and excesse of men, that they haue deuised another thing in them to commend, for they find forsooth a special dainty tast in the hard callous substance of that which they call their hand: for no other reason (I beleeue) but because they haue a conceit that they eat yvorie, when they chew this gristle of their trunk. In temples are to be seen Elephants teeth of the greatest size: howbeit in the marches of Africke where it confineth vpon Æthiopia, they make of yuory the very principals and corner posts of their houses: also with the Elephants tooth they make mounds & pales both to inclose their grounds, and also to keep in the beasts within park, if it be true that *Polybius* reporteth, from the testimony of king *Gulussa*.

CHAP. XI.

¶ *Where the Elephants are bred: how the Dragons and they disagree.*

Elephants breed in that part of Africke which lieth beyond the desarts and wildernesse of the Syrtis: also in Mauritania: they are found also amongst the Æthyopians and Troglodites, as hath beene said: but India bringeth forth the biggest: as also the dragons that are continually at variance with them, & euermore fighting, and those of such greatnesse, that they can easily clasp and wind round about the Elephants, and withall tye them fast with a knot. In this conflict they die, both the one and the other: the Elephant he falls downe dead as conquered, and with his heauy weight crusheth and squaseth the dragon that is wound and wreathed about him.

CHAP. XII.

¶ *The wittinesse and policie in these creatures.*

Wonderfull is the wit and subtilty that dumbe creatures haue, and how they shift for themselves and annoy their enemies, which is the only difficulty that they haue to arise & grow to so great an heighth and excesseive bignes. The dragon therefore espying the Elephant when he goeth to reliefe, assaileth him from an high tree and launceth himselfe vpon him; but the Elephant knowing well enough he is not able to withstand his windings & knittings about him, seeketh to come close to some trees or hard rocks, and so for to crush and squise the dragon between him and them: the dragons were hereof, entangle and snarle his feet & legs first with their taile: the Elephants on the other side, vndo those knots with their trunk as with a hand: but to preuent that againe, the Dragons put in their heads into their snout, and

fo

A so stop their wind, and withall fret and gnaw the tenderest parts they find there. Now in case these two mortall enemies chance to re-incounter on the way, they bristle & bridle one against another, and addresse themselves to fight; but the chiefe thing the dragons make at is the eie, whereby it comes to passe, that many times the Elephants are found blinde, pined for hunger, and worne away, and after much languishing, for very anguish and sorrow die of their venome. What reason should a man alledge of this so mortall warre betweene them, if it be not a very sport of Nature, and pleasure that she takes, in matching these two so great enemies together, and so euen and equal in each respect? But some report this mutuall war between them after another sort, and that the occasion thereof ariseth from a naturall cause: for (say they) the Elephants blood is exceeding cold, and therefore the dragons be wonderful desirous thereof to refresh and coole themselves therewith during the parching hot season of the yeare. And to this purpose they ly vnder the water, waiting their time to take the Elephants at a vantage when they are drinking; where they catch fast hold first of their trunk, and they haue not so soone clasped and intangled it with their taile, but they set their venomous teeth in the Elephants eare (the onely part of all their body which they cannot reach vnto with their trunk) and so bite it hard: now these dragons are so big withal, that they are able to receiue all the elephants blood: thus are they sucked dry vntill they fall downe dead: and the dragons also, drunke with their blood, are squeseed vnder them, and so dy together.

CHAP. XIII.

¶ *Of Dragons.*

C IN Æthiopia there be as great dragons bred as in India, namely 20 cubits long: but I maruell much at this one thing, that king *Inba* should think they are crested. They are bred most in a countrey of Æthiopia where the *Asachai* inhabit. It is reported, that vpon their coast they are inwrapped foure or fift of them one within another, like to a hurdle or lattise-work, and thus passe the seas to find out better pasturage in Arabia, cutting the waues, and bearing their heads aloft, which serue them in stead of sailes.

CHAP. XIV.

¶ *Of monstrous great Serpents, and namely of those called Boæ.*

D *Megasthenes* writeth, that there be serpents among the Indians growne to that bignesse, that they are able to swallow stags or bulls all whole. *Metrodorus* saith, that about the riuier Rhindacus in Pontus, there be serpents that catch and deuoure the fowles of the aire, be they neuer so swift winged, and soare they neuer so high. Well knowne it is, that *Attilius Regulus*, Generall vnder the Romans during the wars against the Carthaginians, assailed a Serpent neere the riuier Bagrada, which caried in length 120 foot; and before hee could conquer him was driuen to discharge vpon him arrows, quarrels, stones, bullets, and such like shot, out of brakes, slings, and other engins of artillery, as if he had giuen the assault to some strong warlike towne: the prooffe wherof was to be seen by the marks remaining in his skin and chawes; which vntill the war of Numantia remained in a temple or conspicuous place of Rome. And this is the more credible, for that we see in Italy other serpents named Boæ, so big and huge, that in the daies of the Emperor *Claudius* there was one of them killed in the Vaticane, within the belly wherof there was found an infant all whole. This serpent liueth at the first of kins milk, and there of takes the name Boæ. As for other beasts which ordinarily of late are brought from all parts into Italy, and oftentimes haue there been seen, needlesse it is for me to describe their formes in particular curiously.

CHAP. XV.

¶ *Of Scythian beasts, and those which are bred in the North parts.*

F Verry few sauge beasts are ingendred in Scythia for want of trees & pasturage. Few likewise in Germany bordering vpon it. Howbeit that countrey brings forth certaine kinds of goodly great wild boeufs: to wit, the Bisontes, mained with a collar like Lions: and the Vri,

Vri, a mighty strong beast and a swift, which the ignorant people call Buffles, whereas indeed the Buffle is bred in Africke, and somewhat resembles a calfe rather, or stag. The Northerne regions bring forth wilde horses, which there are found in great troupes: like as in Asia and in Africke there are to be seen wild Asses. Moreouer, a certain beast called the Alce, very like to a horse, but that his eares are longer, and his necke also with two markes distinguishing them a-funder. Moreouer, in the Island of Scandinavia there is a beast called Machlis, not much vnlike the Alce aboue-named: common he is there, & much talk we haue heard of him, howbeit in these parts he was neuer seen. He resembles, I say, the Alce, but that he hath neither ioynt in the hough, nor pasternes in his hind legs; and therefore he neuer lieth downe, but sleepeeth leaning to a tree. Wherefore the hunters that lie in wait for these beasts, cut down the trees while they are asleepe, and so take them: otherwise they should neuer be taken, they are so swift of foot, that it is wonderfull. Their vpper lip is exceeding great, and therefore as they graze and feed they go retrograde, lest if they went passant forward, they should fold that lip double vnder their muzzle. There is (they say) a wild beast in Pæonia, called Bonafus, with a maine like an horse, otherwise resembling a bull: many his hornes bend so inward with their tips toward his head, that they serue him in no stead at all for fight, either to offend, or defend himself: and therefore all the helpe hee hath is in his good footmanship, and otherwhiles in his flight by dunging, which he will squirt out from behind him three acres in length. This his ordure is so strong and hot, that it burneth them that pursue him, like fire, if haply they touch it. A strange thing it is, and wonderfull, that the Leopards, Panthers, Lions, and such like beasts, as they go, draw in the points of their claws within their body, as it were into sheaths, because they should neither breake nor wax blunt, but be alwaies keene and sharpe: also, that when they runne they should turne the hooked nailes of their pawes back, and neuer stretch them forth at length but when they meane to assaile or strike any thing.

CHAP. XVI.

¶ Of Lions.

THE Lions are then in their kind most strong and couragious, when the haire of their main or collar is so long that it couereth both necke and shoulders. And this comes to them at a certain age, namely to those that are ingendred by Lions: for such as haue Pards to their sires neuer haue this ornament, no more than the Lionesse. These Lionesses are very lecherous, and this is the cause that the Lions are so fell and cruell. This, Africke knowes best, and sees most; and especially in a great drought, when forwant of water a great number of wild beasts resort by troupes to those few riuers that be there, and meet together: and hereupon it is, that so many strange shaped beasts of a mixt and mungrell kind are there bred, whiles the males either perforce or for pleasure leap and couer the females of all sorts. From hence it is also that the Greeks haue this common prouerbe, *That Africke euermore brings forth some new and strange thing or other.* The Lion knoweth by sent and smell of the Pard, when the Lionesse his mate hath played false, and suffered her selfe to be couered by him; and presently with all his might and maine runneth vpon her for to chastise and punish her. And therefore when the Lionesse hath done a fault that way, she either goeth to a riuer and washeth away the strong and ranke sauor of the Pard, or else keepeth aloofe and followeth the Lion afar off, that he may not catch the said smell. I see it is commonly held, that the Lionesse brings forth yong but once in her life, for that her whelps in her kinling teare her belly with their nailes, and make themselves roome that way. *Aristotle* writeth otherwise, a man whom I cannot name but with great honour and reuerence, and whom in the historie and report of these matters I meane for the most part to follow. And in very truth King *Alexander* the Great, of an ardent desire that he had to know the natures of all liuing creatures, gaue this charge to *Aristotle*, a man singularly accomplished with all kinds of science and learning, to search into this matter, and to set down the same in writing: and to this effect commanded certaine thousands of men, one or other, throughout all the tract as well of Asia as Greece, to giue their attendance and obey him: to wit, all Hunters, Falconers, Fowlers, and Fishers that liued by those professions: Item, all Foresters, Park-keepers, and Variners: all such as had the keeping of heards and flockes of cattell: of bee-hiues, fish-pooles, stewes, and ponds: as also those that kept vp fowle tame or wild,

A in mew: those that fed poultry in bartoñ or coup: to the end that he should be ignorant of nothing in this behalfe, but be aduertised by them, according to his Commission, of all things in the world. By his conference with them he collected so much, as thereof hee compiled those excellent bookes *de Animalibus*, i. of Liuing creatures, to the number almost of 50. Which being couched by me in a narrow roome and bricfe summary, with addition also of some things which he neuer knew, I beseech the Readers to take in good worth: and for the discoerie and knowledge of all Natures works, which that most noble and famous King that euer was desired so much to know, to make a short start abroad with me, and in a bricfe discourse by mine own pains and diligence digested, to see all. To return now vnto our former matter: That great philosopher *Aristotle* therefore reporteth, That the Lionesse at her first litter bringeth forth five whelps, and euery yeare after fewer by one: and when the commeth to bring but one alone, she giueth ouer and is barren. Her whelps at the first are without shape like small gobbets of flesh no bigger than weefels. When they are six moneths old they can hardly go, and for the two first they stir not at all. Lions there be also in Europe (only between the riuers *Achelous* and *Nessus*) and these verily be far stronger than those of Africke or Syria. Moreouer, there are two kinds of Lions: the one short, wel trusted, and compact, with more crisp and curled mains, but these are timorous and cowards to them that haue long and plain haire; for those passe not for any wounds whatsoeuer. The Lions lift vp a leg when they pisse, as dogs do: and moreouer, they haue a strong and stinking breath, their very body also smelleth rank. Seldom they drink, and eate but each other day; and if at any time they feed til they be full, they wil abstain from meat three daies after. In their feeding, whatsoeuer they can swallow without chewing, downe it goes whole: and if they finde their gorge and stomacke too full, and not able indeed to receiue according to their greedy appetite, they thrust their pawes down their throats, and with their crooked clees fetch out some of it again, to the end they should not be heauy and slow vpon their fulnesse, if haply they be put to find their feet and fly. Mine Author *Aristotle* saith moreouer, That they liue very long: and hee proueth it by this argument, That many of them are found toothlesse for very age. *Polybius*, who accompanied *[Scipio] Amylianus* in his voiage of Africke, reporteth of them, That when they be growne aged they will prey vpon a man: the reason is, because their strength will not hold out to pursue in chase any other wilde beasts: then they come about the cities and good towns of Africke, lying in wait for their prey, if any folk come abroad: and for that cause, he saith, that while hee was with *Scipio*, hee saw some of them crucified and hanged vp, to the end that vpon the sight of them other Lions should take example, and be skarred from doing the like mischiefe. The Lion alone of all wilde beasts, is gentle to those that humble themselves vnto him, and will not touch any such vpon their submission, but spareth what creature soeuer lieth prostrate before him. As fell and furious as he is otherwhiles, yet he dischargeth his rage vpon men, before he sets vpon women, and neuer preyeth on babes vnlesse it be for extreme hunger. They are verily perswaded in Lybia, that they haue a certain vnderstanding when any man doth pray or intreat them for any thing. I haue heard it reported for a truth, by a captiue woman of Getulia (which being fled was brought home again to her master) that she had pacified the violent fury of many Lions within the woods and forests, by faire language and gentle speech; and namely, that for to escape their rage, shee hath been so hardy as to say, she was a filly woman, a banished fugitiue, a sickly, feeble, & weak creature, an humble suiter and lowly suppliant to him the noblest of all other liuing creatures, the Soueraigne and commander of all the rest, and that she was too base and vnworthy for his glorious Maiestie to prey vpon her. Many and diuers opinions are currant, according to the sundry occurrences that haue hapned, or the inuentions that mens wits haue deuised as touching this matter; namely, that sauage beasts are dulced and appeased by good words and faire speech: as also that fell serpents may be trained and fetched out of their holes by charmes; yea and by certaine coniurations and menaces restrained and kept vnder for a punishment: but whether it be true or no, I see it is not yet by any man set downe or determined. To come againe to our Lions, the signe of their intent and disposition is their taile; like as in horses, their eares: for these two marks and tokens certainly hath Nature giuen to the most couragious beasts of all others, to know their affections by: for when the Lion stirs not his taile, he is in a good mood, gentle, mild, pleasantly disposed, and as if he were willing to be plaied withall: but in that fit he is seldome seen, for lightly he is alwaies angry. At the first when he entrencheth into his choler,

he beateth the ground with his taile: when he groweth into greater heats, he flappeth and jerketh his flanks and sides withall, as it were to quicken himselfe, and stir vp his angry humour. His maine strength lieth in his brest: hee maketh not a wound (whether it be by lash of taile, scratch of claw, or print of tooth) but the blood that followeth is black. When his belly is full all his anger is past, and he doth no more harme. His generositie and magnanimitie he shewes most in his dangers: which courage of his appeareth not only herein, that he seems to despise all shot of darts against him, defending himselfe a long time onely with the terrible aspect of his countenance, protesting as it were that he is unwilling to deale, vnlesse he be forced thereto in his owne defence, *i. se defendendo*, and at length maketh head again, not as compelled or driuen thereto for any perill that hee seeth, but angered at their folly that assaile or set vpon him: but herein also is seen rather his noble heart and courage, That be there neuer so many hounds and hunters following after him, so long as he is in the open plains where he may be scene, hee maketh semblance as though hee contemned both dog and man, dismarching and retiring with honour, and otherwhiles seeming in his retreat to turne again and make head: but hauing gained the thickets and woods, and gotten into the Forrests out of sight, then he skuds away, then he runneth amain for life, as knowing full well, that the trees and bushes hide him, that his shamefull dislodging and flight is not then espied. When hee chafeth and followeth after other beasts he goeth alwaies saltant or rampant; which he neuer vseth to do when he is chased in fight, but is only passant. If he chance to be wounded, he hath a maruellous eye to mark the party that did it, and be the hunters neuer so many in number, vpon him he runneth only. As for him that hath let fly a dart at him, and yet missed his marke and done no hurt to him, if he chance to catch him, hee all to touzeth, shaketh, tosseth, and turneth him lying along at his feet, but doth him no harme besides. When the Lionesse fighteth for her yong whelps, by report, she fettereth her eies wistly and entirely vpon the ground, because shee would not be affrighted at the sight of the chasing flaues of the hunters. Lions are nothing at all crafty and fraudulent, neither be they suspicious: they neuer look askew, but alwaies cast their eye directly forward, and they loue not that any man should in that sort looke side-long vpon them. It is constantly beleueed, that when they ly a dying they bite the earth, & in their very death shed teares. This creature, so noble as hee is, and withall so cruell and fell, trembleth and quaketh to heare the noise of cart-wheeles, or to see them turne about; nay hee cannot abide of all things Chariots when they be void and empty: frighted hee is with the cockes combe, and his crowing much more, but most of all with the sight of fire. The Lion is neuer sicke but of the peeuishnesse of his stomacke, loathing all meat: and then the way to cure him is to ty vnto him certaine shee Apes, which with their wanton mocking and making moues at him, may moue his patience, and driue him for the very indignitie of their malapert faucinesse, into a fit of madnesse; and then so soone as he hath tasted their blood he is perfectly wel again: and this is the only help.

Scævola the son of *Publius* was the first at Rome that in his Curule *Ædileship* exhibited a fight and combat of many Lions together, to delight the people: but *L. Sylla*, who was afterward Dictator, was the first of all others that in his Pretorship represented a shew of 100 lions with maines and collars of haire: and after him, *Pompey* the Great shewed 600 of them fighting in the grand Cirque, whereof 315 were male Lions with mane. And *Cæsar* Dictator brought 400 into the shew-place. The taking of them in old time was a very hard piece of worke, and that was commonly in pit-falls: but in the Emperor *Claudius* his daies it chanced, that a shepheard or heardsmen who came out of *Getulia* taught the manner of catching them: a thing otherwise that would haue beene thought incredible, and altogether vnbeseeeming the name and honour of so goodly a beast. This *Getulian*, I say, fortun'd to encounter a Lion, and when he was violently assailed by him, made no more ado but threw his mandilion or cassocke full vpon his eyes. This feat or cast of his was soone after practised in the open shew-place, in such sort that a man would hardly haue beleueed but hee that saw it, that so furious a beast should so easily be quailed, and daunted so soone as euer hee felt his head couered, were the things neuer so light, making no resistance, but suffering one to do what hee would with him, euen to binde him fast, as if in very truth all his vigour and spirit rested in his eies. Lesse therefore is it to be maruelled at, that *Zyfmachus* strangled a Lion, when as by the commandement of *Alexander* the Great he was shut vp alone together with him. The first man that euer yoked them at Rome, and made them to draw in a chariot, was *M. Antonius*. And verily it was in the

- A the time of ciuill warre, after the battell fought in the plaines of *Pharsalia*; a shrewd and vnhappy preface of the future euent, and namely for men of an high spirit & braue mind in those daies, to whom this prodigious sight did prognosticate the yoke of subiection: for what should I say how *Anthony* rode in that wise with the Courtesan *Cytheris* a common Affect in Interludes vpon the stage? To see such a sight was a monstrous spectacle, that passed all the calamities of that time. It is reported that *Hanno* (one of the noblest Carthaginians that euer were) was the first man that durst handle a Lion with his bare hand, and shew him gentle and tame, to follow him all the city ouer in a slippe like a dog. But this deuice and trick of his turned to his great damage and vtter vndoing: for the Carthaginians hereupon laid this ground, that *Hanno*, a man of such a gift, so witty and inuentive of all deuises, would be able to persuaide the people to whatsoeuer his minde stood; and that it was a dangerous and ticklish point, to put the liberty of so great a state as Carthage was, into the hands and managing of him who could handle and tame the furious violence of so sauage a beast, and thereupon condemned and banished him. Moreouer we find in histories many examples also of their clemencie and gentleness, seen vpon diuers casuall occasions. *Mentor* the Syracusan fortun'd in Syria to meet with a Lion, who after an humble maner in token of obedience and submission, seemed to rumble and wallow before him: hee astonied for feare started backe and began to fly; but the wild beast followed him still, and was ready at euery turne to present himselfe before him, licking the very tracks of his foot-steps as he went, in flattering manner, as if he would make loue vnto him. *Mentor* at length was ware that the Lion had a wound in his foot, and that it swelled therewith: whereupon he gently plucked out the spill of wood that had gotten into it, and so eased the beast of his paine. This accident is for a memoriall represented in a picture at *Syracusa*. Semblably, *Elpis* a *Samian* being arriued and landed in *Africk*, chanced to espy neer the shore a Lion gaping wide, and seeming afar off to whet his teeth at him in menacing wise: he fled apace to take a tree, calling vpon god *Bacchus* to help him (for then commonly wee fall to our prayers when we see little or no hope of other helpe:) but the Lion stopt him not in his flight, albeit he could haue crossed the way well enough, but laying himselfe downe at the tree root, with that open mouth of his wherewith he had skared the man, made signes to moue pitty and compassion. Now so it was, that the beast hauing lately fed greedily, had gotten a sharp bone within his teeth, that put him to exceeding paine: besides that, hee was almost famished: and he looking pittifully vp to the man, shewed how he was punished himselfe among those verie weapons wherewith he was wont to anoy others, and after a sort with dumb and mute prayers besought his help. *Elpis* auised him well a pretty while; and besides that hee was not very forward to venture vpon the wilde beast, he staied the longer and made the lesse hast, while he considered rather this strange and miraculous accident, than otherwise greatly feared. At last he comes downe from the tree and plucks out the bone, while the Lion held his mouth handsomely to him, and exposed himselfe to his helpfull hand as fitly as he possibly could. In requitall of which good turne, it is said, that so long as this ship of his lay there at anchor, the Lion furnished him and his company with good store of venison ready killed to his hand. And vpon this occasion *Elpis* after his return dedicated a temple to *Bacchus*: which vpon this reason the Greeks called *ἱλίουσιος ἀνστήρ*, *i. of gaping Bacchus*; or *Ζωστήριος ἀνστήρ*, *i. the chappell of Bacchus the Sauour*. Can we maruell any more from henceforth, that wild beasts should marke and know the footing of a man, seeing that in their extremities and necessities they haue recourse to him alone for hope of succour? Why went not they to other creatures? or who taught them that the hand of man was able to cure them? vnlesse this be the reason, that griefe, anguish, and extreme perill forceth euen sauage beasts to seeke all means of help and reliefe.

CHAP. XVII.

Of Panthers.

- F *Demetrius* the philosopher, so wel seen into the speculation of Natures works, & the causes thereof, makes mention of as memorable a case as the former, touching a Panther: for as he saith there was a Panther desirous to meet with a man, & therefore lay in the mids of an high-way vntill some passenger should come by, and suddenly was espied by the father of

of *Philinus* the Philosopher, who trauailed that way. The man (for feare) began to retire and go backe againe, but the wild beast kept a tumbling and vauing all about him, doubtlesse and by all apparance after a flattering sort, as if it would haue had somewhat, and such a tossing and tormenting of it selfe she made, so piteously, that it might soone be seene in what grieve and pain the Panther was. The poore beast had but lately kindled, and her young whelps were false into a ditch, as farre off well, the first point that the man shewed of pittie and commiseration was, not to be affraid, and the next was, to haue regard and care of her: follow he did the Panther, as she seemed to train and draw him by his garment (which with her claws shee tooke hold of daintily) vntill they were come to the pit or ditch aboue-said. So soon then as he knew the cause of her grieve and sorrow, and withall what might be the reward of his courtesie, euen as much as his life came to, he drew forth her little ones that were fallen into the said pit: which done, she and her whelps together leaping and shewing gambols for ioy, accompanied him, and through the wildernesse directed him vntill he was gotten forth. So as it appeared in her, that shee was thankfull vnto him, and requited his kindnesse, albeit there passed no couenant nor promise between them of any such recompence: a rare example to be found euen among men. This story and such like giue great colour of truth to that which *Democritus* reporteth, namely, that *Thobas* in Arcadia saued his life by means of a dragon. This *Thobas* being but a very childe, had loued this dragon when he was but yong, very well, and nourished him: but at last, being somewhat fearfull of his nature, and not well knowing his qualities, and fearing withall the bignes that now he was growne vnto, had carried him into the mountains and delarts: wherein it fortuned that he was afterward set vpon and inuironed by theeues: whereupon he cried out, and the dragon knowing his voice, came forth and rescued him. As for babes and infants cast forth to perish, and sustained by the milke of wilde beasts, like as *Romulus* and *Remus* our first founders, who were suckled by a she wolfe; such things in mine opinion are in all reason to be attributed more to fortune and fatall destinies, than to the nature of those beasts. The Panthers and Tygers are in a maner the only beasts (for the varietie of spotted skins and fures which they yeeld) in great request, and commendable: for other beasts haue each one a proper colour of their owne, according to their kind: Lions there be all blacke, but they are found in Syria only. The ground of the Panthers skin is white, beset all ouer with little black spots like eies. It is said, that all foure-footed beasts are wonderfully delighted and enticed by the smell of Panthers; but their hideous looke and crabbed countenance, which they bewray by shewing their heads, skareth them as much againe: wherefore their maner is to hide their heads, and hauing trained other beasts within their reach by their sweet fauour, they fly vpon them and worrie them. Some report, that they haue one marke on their shoulder resembling the Moone, growing and decreasing as she doth, sometime shewing a full compasse, and otherwhiles hollowed and pointed with tips like hornes. In all this kind and race of wild beasts now adaies they call the male * *Varix* and *Pardi*, and great abundance there is of them in Africke and Syria. Some there be againe that make no other difference betweene the Luzernes and Leopards, and these Panthers, but only this, that the Panthers are white: and as yet I know no other marks to descry them by. There passed an old Act and Ordinance of the Senate, forbidding expressely that any Panthers of Africke should be brought into Italy. Against this edict, *Cn. Aufidius* a Tribune of the commons put vp another bill vnto the people; and granted it was, That for the solemnitie of the games *Circenses* they might be brought ouer. *Scaurus* was the first man who in his Edileship exhibited a shew vnto the people of 150 Luzernes together. After him *Pompey* the Great brought forth 410. The Emperor *Augustus* 420: who also in the yere that *Q. Tubero* and *Fabius Maximus* were Consuls together (vpon the 4 day before the Nones of May, at the dedication of the Theatre of *Marcellus*) was the first of all others that shewed a tame Tyger within a cage: but the Emperor *Claudius* foure at once.

CHAP. XVIII.

¶ Of the Tyger and his nature: of Camels, *Chamelopardales*, and when they were first seen at Rome.

TYgers are bred in Hircania and India: this beast is most dreadfull for incomparable swiftnesse, and most of all seen it is in the taking of her yong: for her litter (whereof there is a great

A great number) by the hunters is stolne and caried away at once, vpon a most swift horse for the purpose; lying in wait to espy when the dam is abroad: and shifteth this booty from one fresh horse to another, riding away vpon the spur as hard as they can. But when the Tygresse comes and finds her den & nest empty (for the male Tygre hath no care nor regard at all of the yong) she runs on end after her yong ones, following those that caried them away, by the sent of their horse footing. They perceiuing the Tygresse to approach, by the noise she maketh, let fall or cast from them one of her whelps: vp she taketh it in her mouth, and away she runneth toward her den, swifter for the burthen that she carrieth. And presently she setteth out again, followeth the quest after her fawnes, and ouertaketh the Hunter that had them away. Thus runneth she to and fro, vntill she see that they be imbarqued and gone; and then for very anger that she hath not sped of her purpose, shee rageth vpon the shore and the sands for the losse of her fawnes.

As for Camels, they are nourished in the Levant or East parts among other heards of great cattell: two kindes there be of them, the *Bactrians* and the *Arabick*: differing herein, that the *Bactrians* haue two bunches vpon their backs; the other but one apiece there, but they haue another in their brest, whereupon they rest and ly. Both sorts want the vpper row of teeth in their mouthes, like as bulls and kine. In those parts from whence they come they serue all to carry packs like labouring horses, and are put to seruice also in the wars, and are backed of horfmen: their swiftnesse is comparable to that of horses; they grow to a iust measure, and exceed not a certaine ordinary strength. The Camell in his trauelling will not goe a iot farther than his ordinary iourney; nether will hee carry more than his accustomed and vsuall load. Naturally they doe hate horses. They can abide to be foure daies together without drinke: and when they drinke or meet with water, they fill their skin full enough to serue both for the time past and to come: but before they drinke they must trample with their feet to raise mud and sand, and so trouble the water, otherwise they take no pleasure in drinking. They liue commonly fifty yeares, and some of them an hundred. These creatures also otherwhile fall to be mad, so much as it is. Moreouer, they haue a deuice to splay euen the very females, to make them fit for the warres; for if they be not couered they become the stronger and more courageous.

Two other kinds of beasts there be that resemble in some sort the Camels: the one is called of the *Aethiopians*, the *Nabis*, necked like an horse, for leg and hoofe not vnlike the boeue, headed directly like a Camell, beset with white spots vpon a red ground, whereupon it taketh the name of *Camelopardalus*: and the first time that it was seen at Rome, was in the games *Circenses*, set out by *Cesar* Dictator. Since which time he comes now and then to Rome, to be looked vpon more for sight, than for any wild nature that hee hath: whereupon some call her the sauage Sheepe.

CHAP. XIX.

¶ Of the *Chaus* and *Cephus*.

THE Hinde-wolfe, which some call *Chaus*, and the *Gaules* were wont to name *Rhaphius*, resembling in some sort a Wolfe with Leopards spots, were shewed first in the solemnitie of the games and plaies exhibited by *Cn. Pompeius* the Gréar. He also brought out of *Aethyopia* other beasts named *Cephi*, i. *Semivulpes*, whose forefeet were like to mens hands, and the hinde feet and legs like those of a man. He was neuer seene afterward at Rome.

CHAP. XX.

¶ Of the *Rhinoceros*.

IN the same solemnities of *Pompey*, as many times else was shewed a *Rhinoceros*, with one horne and no more, and the same in his snout or muzzle. This is a second enemy by nature the Elephant: hee sleth that horne of his against hard stones, making it sharpe against he should fight; and in his conflict with the Elephant he layes principally at his belly, knowing it to be more tender than the rest. He is full as long as he, his legs are much shorter, and of the box colour.

T

CHAP.

CHAP. XXI.

¶ *Lynces or Onces, and Marmozets or Apes, called Sphinges : of Crocutes, Monkeys, English bæufes, Leocrocutes, Eale : Æthiopian bulls, the Mantichore and Lycornes : of the serpents called Caroblepes, and the Basiliske.*

ONces are common, so are Marmozets, with a browne dusky haire, hauing dugs in their brest. Æthiopia breedeth them, like as many other monstrous beasts, to wit, horses with wings, and armed with hornes, which they call Pegasi. Also the Crocutes [a kind of mastiue dogs] ingendred betwixt a dog and a Wolfe: these are able to crash with their teeth all they can come by: and a thing is no sooner downe their swallow, and got into their stomacke, but presently they digest it. Moreouer, the Cercopithecii, *i.* Monkeys with black heads, otherwise haired like Asses, differing from other Apes in their cry. The Indians haue certain bæufs with one horne, and others with 3. Also the Leocrocute, a most swift beast, as big almost as an Ass, legged like an Hart, with a necke, taile, and brest of a Lion, headed like these grayes or Badgers, with a clouen foot in twaine: the slit of his mouth reacheth to his eares, in stead of teeth an entire whole bone. They report that this beast feigneth a mans voice. They haue also among them another beast named Eale, for bignes equall to the riuer-horse, tailed like an Elephant, either black or reddish tawny of colour: his mandibles or chawes resemble those of the Bore, he hath hornes about a cubit long, which he can stir or moue as he list: for being in fight he can set them both or one of them as he will himselfe, altering them euery way, one while streight forward to offend, otherwhiles bending byas, as he hath reason to nort or push toward, or auoid anemie. But the most fell and cruell of all others of that country be the wild bulls of the Forrest, greater than our common field bulls, most swift, of colour brended, their eies gray or blewish, their haire growing contrary, their mouth wide and reaching to their eares: their hornes likewise hard by, moueable; their hide as hard as a flint, checking the dent of any weapon whatsoeuer, and cannot be pierced: all other wilde beasts they chase and hunt, themselves cannot be taken but in pit-falls: in this their wildnesse and rage they dy, & neuer become tame. *Ctesias* writeth, that in Æthiopia likewise there is a beast, which he calls Mantichora, hauing three ranks of teeth, which when they meet together, are let in one within another like the teeth of combs, with the face and eares of a man, with red eies, of colour sanguine, bodied like a Lion, and hauing a taile armed with a sting like a Scorpion: his voice resembles the noise of a flute and trumpet sounded together: very swift he is, and mans flesh of all other he chiefly desireth. In India there be found bæufs whole hoofed, with single hornes; also a wilde beast named Axis [as some thinke a muske cat] with a skin like a fawne or hind-calf, howbeit marked with more and whiter spots. This beast is consecrated to *Bacchus*, and vnder his protection. The Orsians of India hunt Apes, and take a number of them white all ouer. But the most fell and furious beast of all other is the Licorne or Monoceros: his body resembles a horse, his head a stag, his feet an Elephant, his taile a bore; he loweth after an hideous manner, one black horne he hath in the mids of his forehead, bearing out two cubits in length: by report, this wilde beast cannot possibly be caught aliue. Among the Hesperian Æthiopians there is a fountain named Nigris, the head (as many haue thought) of the riuer Nilus, and good reason there is for it, alledged by vs before: neere which spring keepeth a wilde beast called Caroblepes, little of body otherwise, heavy also and slow in al his limnes besides, but his head only is so great that his body is hardly able to beare it, he alwaies carrieth it downe to the earth, for if hee did not so, hee were able to kill all mankind; for there is not one that looketh vpon his eies, but he dies presently. The like propertie hath the serpent called a Basiliske: bred it is in the prouince Cyrenaica, and is not aboute twelue fingers bredth long: a white spot like a starre it carrieth on the head, and sets it out like a coronet or diadem: if he but hisse once, no other serpents dare come neere: hee creepeth not winding and crawling byas as other serpents doe, with one part of the body driuing, the other forward, but goeth vpriight and aloft from the ground with one halfe part of his body: he killeth all trees and shrubs not onely that he toucheth, but also that hee breatheth vpon: as for graffe and herbes, those he findeth and burneth vp, yea, and breaketh stones in sunder: so venomous and deadly he is. It is receiued for a truth, that one of them on a time

A time was killed with a launce by an horsman from his horse-back, but the poison was so strong, that went from his body along the staffe, as it killed both horse and man: and yet a silly weazle hath a deadly power to kill this monstrous serpent, as pernicious as it is [for many kings haue been desirous to see the experience thereof, and the manner how he is killed.] See how Nature hath delighted to match euery thing in the world with a concurrent. The manner is, to cast these weazles into the hole an deranies were they lye, (and easie they be to know by the stinking sent of the place about them): they are not so soone within, but they overcome them with their strong smell, but they die themselves withall; and so Nature for her pleasure hath the combat dispatched.

CHAP. XXII.

¶ *Of Wolues.*

IT is commonly thought likewise in Italy, that the eye sight of wolues is hurtful; in so much, as if they see a man before hee espy him, they cause him to lose his voice for the time. They that be bred in Affrick and Ægypt, are but little, and withal nothing liuely, but without spirit. In the colder clime, they be more cruell and eger. That men may be transformed into wolues, and restored againe to their former shape, we must confidently beleue to be a lowd lie, or else giue credit to all those tales which we haue for so many ages found to be meere fables. But how this opinion grew first, & is come to be so firmly ferled, that when we would giue men the most opprobrious words of defiance that we can, we terme them **Versipelles*, I thinke it not much amiss in a word to shew. *Euanthes* (a writer among the Greekes, of good account and authority) reporteth, that he found among the records of the Arcadians, That in Arcadia there was a certaine house and race of the *Antei*, out of which one euermore must needs be transformed into a wolfe: and when they of that family haue cast lots who it shall be, they vse to accompany the party vpon whom the lot is false, to a certaine meere or poole in that country: when he is thither come, they turne him naked out of all his clothes, which they hang vpon an oke thereby: then he swimmeth ouer the said lake to the other side, and being entered into the wilderness, is presently transfigured and turned into a wolfe, and so keepeth company with his like of that kind for nine yeeres space: during which time, (if he forbear all the while to eat mans flesh) he returneth againe to the same poole or pond, and being swomme ouer it, receiueh his former shape againe of a man, saue only that he shall look nine yeeres elder than before. *Fabius* addeth one thing more and saith, That he finderh againe the same apparell that was hung vp in the oake aforesaid. A wonder it is to see, to what passe these Greekes are come in their credulity: there is not so shamelesse a lye, but it findeth one or other of them to uphold and maintaine it. And therefore *Agriopas*, who wrote the *Olympionica*, telleth a tale of one *Damantus Parrhasius*, That he vpon a time at a certain solemne sacrifice (which the Arcadians celebrated in the honour of *Iupiter Lycæus*) tasted of the inwards of a child that was killed for a sacrifice, according to the manner of the Arcadians (which euen was to shed mans blood in their diuine seruice) and so was turned into a wolfe: and the same man ten yeeres after, became a man againe, was present at the exercise of publick games, wrestled, did his deuoir, and went away with victory home againe from Olympia. Ouer and besides, it is commonly thought and verily beleueed, that in the taile of this beast, there is a little string or haire that is effectuall to procure loue, and that when he is taken at any time, he casteth it away from him, for that it is of no force and vertue vlesse it be taken from him whiles he liues. He goeth to rut in the whole yere not aboute twelue dayes. When he is very hungry and can get no other prey, he feedeth vpon the earth. In the case of presages and fore-tokens of things to come, this is obserued That if men see a wolfe abroad, cut his way and turne to their right hand, it is good; but if his mouth be full when he doth so, there is not a better signe or more lucky in the world againe.

F There be of this kind that are called Hart-wolues, such as we said that *Pompey* shewed in the grand Cirque, brought out of Fraunce. This beast (they say) be he neuer so hungry when hee is eating, if he chauce to look backe, forgetteth his meat, sinketh away, and seeketh for some other prey.

CHAP. XXIII.

¶ Of Serpents.

AS touching serpents we see it ordinary, that for the most part they are of the colour of the earth, wherein they lie hid: and an infinite number of sorts there be of them. The serpent Ceraſtes hath many times foure small hornes, standing out double; with mouing whereof the amuseth the birds, and traineth them vnto her for to catch them, hiding all the rest of her body.

Amphisbæna hath two heads as it were, namely one at the taile; as if she were not hurtfull enough to cast her poyson at one mouth only. Some are scaled, others spotted and painted, but generally the venom of them all is deadly. There be of them that from the boughes of trees shoot and launce themselves: in such manner, as that we are not onely to take heed of serpents as they go and glide vpon the ground, but also to looke vnto them that fly as a dart or arrow sent out of an engin. The Aspides swell about the necke when they purpose to sting: and no remedie is there for them that are stung and bitten by them, vnlesse the wounded parts be cut off presently. This pestilent creature, as venomous as he is, hath one point yet of vnderstanding or affection rather; you shall not see them wandring abroad but two and two together, male and female, as if they were yoked together: and unneeth or not at all can they liue alone without their mate; so that if one of them be killed, it is incredible how the other seeks to be reuenged: it pursueth the murderer, and knoweth him again among a number of people, be they neuer so many: him it courseth, and layeth for his life, notwithstanding what difficulties soeuer, he breaketh through all, be it neuer so far thither, and nothing may impeach this reuenging humor, vnlesse some riuer be between to keep it backe, or that the party make speed to escape away in great haste. And I assure you, I am not able to say, whether Nature hath bin more free and prodigall in sending among vs such noisome things, or giuing vs remedies againe for them. For to begin withall, she hath afforded to this creature but a darke sight, and dim eyes, and those not placed in the forefront of the head, to see forward and directly, but set in the very temples. And hereof it is, that these serpents are raised oftner by their hearing than sight.

CHAP. XXIV.

¶ Of the Rat of India called Ichneumon.

BEsides the foresaid infirmities, there is mortall war between them and the Ichneumones or Rats of India. A beast this is well knowne to the Aspis, in this regard especially, that it is bred likewise in the same Egypt. The manner of this Ichneumon is, to wallow oft times within the mud, and then to dry it selfe against the Sun: and when he hath thus armed himself as it were with many coats hardened in this manner, he goeth forth to combat with the Aspis. In fight he sets vp his taile, and whips about turning his taile to the enemy, and therein lacereth and receiueth all the strokes of the Aspis, and taketh no harme thereby: and so long he maintaineth a defensue battell, vntill he espy a time, turning his head a to-side, that hee may catch the Aspis by the throat, and throttle it. And not content thus to haue vanquished this enemy, he addresseth himselfe to the conflict with another, as hurtfull euery way & dangerous as the former.

CHAP. XXV.

¶ Of the Crocodile, Scinke, and Riuer-Horse.

THe riuer Nilus nourisheth the Crocodile; a venomous creature, foure footed, as dangerous on water as land. This beast alone, of all other that keepe the land, hath no vse of a tongue; he only moueth the vpper jaw or mandible, wherewith he biteh hard; and otherwise terrible he is, by reason of the course and ranke of his teeth, which close one within another, as if two combes grew together. Ordinarily he is aboute eightene cubits in length. The female layeth eggs as big as geese do, and sitteth euery vpon them out of the water: for a certaine naturall foreknowledge she hath, how far the riuer Nilus will that yeare rise when he is at the highest,

A highest and without it will see be sure to sit. There is not another creature againe in the world, that of a smaller beginning, groweth to a bigger quantity. His feet be armed with claws for offence, and his skin so hard, that it will abide any injury whatsoeuer, and not be pierced. All the day time the Crocodile keepeth vpon the land, but he passeth the night in the water: and in good regard of the season he doth the one and the other. When he hath filled his belly with fishes, he lieth to sleep vpon the sands in the shore: and for that he is a great and greedie deuourer, somewhat of the meat sticketh euermore between his teeth. In regard whereof cometh the wren a little bird called there Trochilos, and the king of birds in Italy: and shee for her victuals sake, hoppeth first about his mouth, falleth to pecking or picking it with her little neb or bill, and so forward to the teeth, which he cleaseth; and all to make him gap. Then getteth shee within his mouth, which he openeth the wider, by reason that he taketh so great delight in this her scraping and scouring of his teeth and claws. Now when he is lulled as it were fast asleep with this pleasure and contentment of his: the rat of India, or Ichneumon abovesaid spieth his vantage, and seeing him lye thus broad gaping, whippeth into his mouth, and shooteth himselfe downe his throat as quicke as an arrow, and then gnaweth his bowels, eateth an hole through his belly, and so killeth him.

Within the riuer Nilus there breeds another Serpent called Scincos, like in forme and proportion somewhat to the Crocodile, but not all so big as the Ichneumon: the flesh whereof seruethe for a singular Antidote or countre-poison; as also for to prouoke the heart of lust in men.

C But to returne againe to the Crocodile: the mischief that he doth is so great, that Nature is not content to haue giuen him one mortal enemy & no more; & therefore the dolphins also enter the riuer Nilus in despite of the Crocodiles, that take themselves for kings there, as if this riuer were their peculiar kingdome: but seeing they be otherwise inferior to the Crocodiles in strength, who alwaies driue them away from preiding or feeding there, they deuise to ouermatch him in sle craft and subtilty, and so kill him. And in truth they haue certain fins or wings as it were vpon their backe, as trenchant & keene as kniues, properly made as it were, for this purpose. For surely all creatures are herein naturally very skilfull and cunning, to know not only their owne good, and what is for them, but also what may hurt and annoy their enemies. Ware they be what offensive weapons they haue, and of what force they are: they are not ignorant of fit occasions and opportunities to take their vantage, ne yet of the weak parts of their occurrents, by which they may assaile and conquer them the sooner. Thus the Dolphins knowing full well, that the skin of the Crocodiles belly is thin and soft, make as though they were afraid of them as he comes, and so diue vnder the water, vntill he be gotten vnder his belly, & then punch and cut it with the foresaid sharp-pointed finnes. Moreouer, there is a kind of people that cary a deadly hatred to the Crocodile, and they be called Tentyrites, of a certaine Isle euen within Nilus, which they inhabite. The men are but small of stature, but in this quarrell against the Crocodiles, they haue hearts of Lions, and it is wondrous to see how resolute and courageous they are in this behalfe. Indeed, this Crocodile is a terrible beast to them that flie from him: but contrary, let men pursue him or make head againe, he runnes away most cowardly. Now, these Islanders be the only men that dare encountre him affront.ouer and besides, they will take the riuer, and swim after them, nay they wil mount vpon their backs, and set them like horsmen: and as they turne their heads, with their mouth wide open to bite or deuour them they will thrust a club or great cudgell into it crosse ouerthwart, and so holding hard with both hands each end thereof, the one with the right, and the other with the left, and ruling them perforce (as it were) with a bit and bridle, bring them to land like prisoners: when they haue them there, they will so fright them only with their words and speech, that they compel them to cast vp and vomit those bodies againe to be entered, which they had swallowed but newly before. And therefore it is, that this is the only Isle which the Crocodiles wil not swim to: for the very smell and sent of these Tentyrites is able to driue them away, like as the Pelli with their fauour put Serpents to flight. By report, this beast seeth but badly in the water: but be they once without, they are most quick sighted. All the 4 winter months they liue in a cage, and eat nothing at all. Some are of opinion, that this creature alone groweth all his life: and surely a great time he liueth.

The same riuer Nilus bringeth forth another beast called Hippopotamus, a Riuer-horse. Taller he is from the ground than the Crocodile: he hath a clouen foot like a bœufe: the back,

maine and haire of an horse, and he hath his neyng also. His muzzle or snout turneth vp: his taile twineth like the Bores, and his teeth likewise are crooked and bending downward as the Bores tusks, but not so hurtfull: the skin or hide of his backe vnpenetrable [whereof are made targuets and head-pieces of doubty proof that no weapon wil pierce] vnlesse it be foked in water or some liquor. He eateth downe the standing corne in the field: and folke say that he setteth downe beforehand where he will pasture and feed day by day: and when hee fets forward to any field for his reliefe hee goeth alwaies backward, and his tractes are seene leading from thence, to the end that against his return he should not be forelaide nor followed by his footing

CHAP. XXVI.

¶ *Who first shewed the riuer-Horse and Crocodiles at Rome. Also the medicinable means found out by the said dumbe creatures.*

Marcus Scaurus was the first man, who in his plaies and games that he set out in his Edileship, made a shew of one water-Horse and foure Crocodiles, swimming in a poole or mote made for the time during those solemnities.

The riuer-Horse hath taught physitions one deuice in that part of their profession called Surgerie: for he finding himself ouer-grosse & fat by reason of his high feeding so continually, gets forth of the water to the shore, hauing spied afore where the reeds and rushes haue bin newly cut: and where he seeth the sharpest cane and best pointed, hee fets his body hard vnto it, to pricke a certaine veine in one of his legs, and thus by letting himselfe bloud maketh euacuation: whereby his body, otherwife inclining to diseases and maladies, is well eased of the superfluous humor: and hauing thus done, hee stopperth the orifice againe with mud, and so stancheth the bloud, and healeth the wound.

CHAP. XXVII.

¶ *What physcall Herbes certaine creatures haue shewed vs, to wit, the harts and stags, the Lizards, Swallowes, Tortois, the Weasell, the Storke, the Bore, the Snake, Dragon, Panther, Elephant, Beares, Stocke-Doues, house Doues, Cranes, and Rauens.*

The like deuice to this, namely of clifters, we learned first of a Fowle in the same Egypt, called Ibis [or the blacke Storke.] This bird hauing a crooked and hooked bill, vseth it in stead of a syringe or pipe to squirt water into that part, whereby it is most kinde and wholsome to auoid the doung and excrements of meat, and so purgeth and clenseth her body. Neither hath dumbe creatures directed vs to these feats onely practised by the hand, which might serue for our vse, to the preservation of our health, and cure of diseases: for the hart first shewed vs the vertue of the herbe Dictamnus or Dittanie, to draw arrowes forth of the bodie. Perceiuing themselves shot with a shaft, they haue recourse presently to that herbe, and with eating thereof it is driuen out again. Moreover, being stung with the Phalangium, a kinde of spider, or some such venomous vermin, they cure themselves with eating Crai-fishes, or fresh water crabs.

There is a certain herbe called Calaminth, most soueraigne and singular against the biting of serpents: wherewith the Lizards, whensoever they haue fought with them, cure their wounds by applying it thereto.

Celendine [the greater] a most wholsome herbe for the eie sight, Swallowes taught vs how to vse: for with it they helpe their yong ones when their eies be sore and put them to grieve.

The land Tortoise by eating of a kinde of Sauorie or Marjerome, called *Cumila bubula*, armes himselfe against poyson when he should fight with serpents.

The Weasell vseth Rue as a preseruatue when hee purposeth to hunt for Rats, in case hee should fight with any of them.

The Storke feeling himselfe amisse, goeth to the herbe Organ for remedy. And the Bore when he is sicke is his owne physition, by eating iuy and crab fishes, such especially as the sea casteth vp to shore.

The Snake by restinesse and lying still all Winter, hath a certain membrane or filme growing

A ing ouer her whole body; but hauing recourse to Fennel, with the iuice thereof she casteth that old coat that cloggeth her, and appeareth fresh, slick, and yong again. Now the manner of this her vncaising, is this; she beginneth first at the head, and turneth the skin ouer it, and thus she is a whole day and a night a folding it backward, before the inside of that membrane can be turned outward, and so she is clean rid of it. Moreover, when by lying still & keeping close all the Winter time, her sight is become dim and dark, she rubbeth and scoureth her self with the said herbe Fennell, and therewith annointeth and comforteth her eies. But if the scales that are ouergrowne her skin be hard and stiffe, not willing to part and be removed, she maketh no more adoe, but scratcheth them with sharp juniper pricks.

The Dragon finding a certain lothing of meat, and ouerturning of her stomach in the spring time, cureth and helps the same with the iuice of the wild Lettuce.

B The barbarous people when they hunt the Panthers, rub the gobbets of flesh, which they lay as a bait for them, with Aconitum (a kind of poison-ful herbe.) The beasts haue no sooner touched the flesh, but presently their throat swelleth, and they are ready to be stifled and choked: whereupon some haue called this venomous herbe Pardalianches, i. Libard baine, or choke Libard. But the wilde beast hath a remedy against this, namely, the ordure and excrements of a man: yea, and at other times also, when he is not thus poisoned, so eager he is thereof, that when the shepherds for the nonce haue hanged them vp aloft in some vessell about their reach, although they leap vp at them, he is ready to faint with mounting on high, & straining to get the same, and in the end killeth himselfe therewith, & lieth dead on the ground. And yet otherwife he is too vnward for to be killed, and so long it is ere he will die, that when he is panned, and his very guts come forth of his belly, he wil liue still, and fight.

C The Elephant if he chance to let the [Lizard] Chameleon go downe his throat amongst other herbes or leaues (which this Lizard alwaies is like vnto in colour) he goeth straightwaies to the wild Oliue, the only remedy he hath of this poison.

Beares, when they haue eaten Mandrage apples, licke vp pismires to cure themselves withall.

The Stag and Hind feeling themselves poisoned with some venomous weed among grasse where they pasture, go by and by to the Artichoke, and therewith cure themselves.

D The Stock-doues, the Iais, Merles, Blackbirds, Oufels, recover their appetite to meat, which once in a yeare they lose, with eating Bay-leaues that purge their stomach. Partridges, House-doues, Turtledoues, and all Pullein, as Hens, Cocks, and Capons, do the like with Parietarie of the wall. Ducks, Geese, and other water fouls purge with the herb Endiue or Cichory. Cranes and such like help themselves that way with the Marish reed.

The Rauens when he hath killed the Chameleon, and yet perceiuing that he is hurt and poisoned by him, flieth for remedy to the Laurell, and with it represseth and extinguisheth the venom that he is infected withall.

CHAP. XXVIII.

¶ *The Prognostication of weather, taken by the obseruation of dumbe creatures.*

E Moreover, the same vniuersall Nature hath giuen a thousand properties besides vnto beasts: and namely, hath endued very many of them with the knowledge and obseruation of the aire aboue, giuing vs good meanes by them diuers waies, to fore-see what weather we shall haue, what winds, what raine, what tempest will follow: which to decipher in particular, it is not possible, no more than to discourse throughly of their other qualities they haue respectiue to the society with every man. For they aduertise & warn vs before-hand of dangers to come, not only by their fibres and bowels (about the skill and presage wherof, the most part of the world is amased) but also by other manner of tokens and significations. When an house is readie to tumble downe, the mice goe out of it before: and first of all, the spiders with their webs fall down. As for the flight of birds & their fore-tokening, called Augurie, there is an Art of it, and the knowledge thereof is reduced into a method, in so much as at Rome there was a colledge of Augurus instituted: by which it may appeare in what account & regard that sacerdotal dignitie and profession was. In Thracia, which is a cold and frozen countrie, the Fox also will not passe ouer any riuer or poole that is frozen, before he trie the thickenesse of the yce by

by his eare, and otherwise it is a beast most quicke of hearing. And obserued it is, that men neuer venture thereupon, but when he goes to reliefe, or returneth from thence, and then he layes his eare close to the yce, and guessteth thereby how thicke the water is frozen.

CHAP. XXIX.

¶ *What cities and nations haue been utterly destroyed by little beasts.*

Nothing is more certain and notorious than this, that much hurt and dammage hath been known to come from small contemptible creatures, which otherwise are of no reckoning and account. *M. Varro* writes, That there was a towne in Spaine vndermined by Connies: and another likewise in Theffalie, by the Moldwarpes. In France the inhabitants of one citie were driuen out and forced to leaue it, by Frogs. Also in Affricke the people were compelled by Locusts to void their habitations: and out of Gyarus an Island, one of the Cyclades, the Islanders were forced by Rats and Mice to flee away. Moreouer, in Italie the citie Amycle was destroyed by serpents. In Æthiopia, on this side the Cynamolgi, there is a great country lieth wast and desart, by reason that it was dispeopled sometime by Scorpions, and a kinde of Pismires called Solpugæ. And if it be true that *Theophrastus* reporteth, the Teriens were chased by certaine wormes called Scolopendres. But now let vs returne to other kinds of wild beasts.

CHAP. XXX.

¶ *Of the Hyæna, Crocuta, Mantichora, Bieuers, and Oisters.*

As touching Hyænes, it is commonly beleued, that they haue two natures, and that euery second yeere they change their sexe, being this yeere males, and the next yeere females. Howbeit, *Aristotle* denieth it. Their necke and the mane therewith, together with the backe, are one entire bone without any ioint at all, so as they cannot bend their necke without turning the whole body about. Many strange mattes are reported of this beast, and aboue all other, that he will counterfeit mans speech, and comming to the shepheards cottages, will call one of them forth, whose name he hath learned, and when he hath him without, al to worrie and teare him in peeces. Also it is said that he will vomit like a man, thereby to train dogs to come vnto him, and then will deuoure them. Also, this beast alone of all others, will search for mens bodies within their graues and sepulchres, and take them forth. The female is feldome taken. He changeth his eies into 1000 diuers colours. Moreouer, if a dog come within his shadow, he presently loseth his barking and is quite dumbe. Again by a kind of magicall charme or enchantment, if he goe round about any other liuing creature but three times, it shall not haue the power to stir a foot and remooue out of the place. The Lionesses of Æthiopia, if they be couered with any of this kinde, bring forth another beast called Leocrocuta, which likewise knowes how to counterfeit the voice both of man, and of other beasts. He sees continually with both eies: he hath one entire bone in stead of teeth in either iaw (and no gombs at all) wherewith he cuts as with a knife. Now these bones, because they should not wax dul and blunt with continuall grating one against the other, they are enclosed each of them with a case or sheath.

Inba reports that the Mantichora also in Æthiopia resembles mens language. Great store of Hyænes be found in Affricke: which also yeelds a multitude of wild Asses. And one of the males is able to rule and leade a whole flocke of the female asses. This beast is so ialous, that they looke narrowly to the females great with young: for so soone as they haue foled, they bite off the cods of the little ones that be males, and so gueld them. But contrariwise, the shee asses when they be big, seeke corners, and keepe out of their way, that they might bring forth their young secretly without the knowledge of the Stallions: for desirous they are to haue many males: so lecherous they be, and glad euermore to be couered.

The Bieuers in Pontus gueld themselves, when they see how neer they are driuen, and be in danger of the hunters: as knowing full well, that chased they be for their genetoires: and these their stones, Physitians call Castoreum. And otherwise, this is a dangerous and terrible beast with his teeth. For verily, he will bite down the trees growing by the riuers sides, as if they were cut with an axe. Looke where he catcheth hold of a man once, he neuer leaues nor less loose vntill he haue knapped the bone in sunder, and heard it cracke againe. Tailed hee is like a fish, otherwise

A otherwise he resembleth the Otter. Both these beasts liue in the water altogether, and cary an haire foster than any plume or downe of feathers.

CHAP. XXXI.

¶ *Of Frogs, Sea-calues, and star-Lizards called Stelliones.*

The venomous frogs and rodes called Rubetæ, which liue both on land, and also in the water, yeeld many good things medicinable. It is said, that their manner is to let goe & cast from them all that is good within them, reseruing only to themselves all the poison: and when they haue bin at their food, take the same vp againe. The sea calfe likewise liueth both in the sea, and vpon the land: and hath the same nature and qualitie that the beiuier is, for hee casteth vp his gall, which is good for many medicines: & so he dorth the runnet in his maw, which is a singular remedy for the falling sicknes: for wel he is ware, that men seek after him for these two things. *Theophrastus* writeth, That the Lizards called Stelliones, cast their old coat, like as Snakes do, but when they haue so done, they eat it vp againe, and so preuent men of the helpe thereby for the said falling euill. He reporteth besides, that their stings and bitings in Greece be venomous and deadly: but in Sicily harmlesse.

CHAP. XXXII.

¶ *Of red and fallow Deere.*

The Bucke or Stag, albeit that he be the most gentle and mild beast in the world, yet is he as enuious as the rest, & loth to part with that which is good for others. Howbeit, if he chance to be ouerlaid with hounds, then gently of himselfe hee hath recourse to a man. Likewise, the Hinds when they are to calue, chuse rather some place neere to the pathes and waies that are beaten with many steps, than secret corners, for feare of other wilde beasts. They begin to goe to rut after the rising of the star Arcturus, which is much about the 5 of September: they goe 8 months: and otherwhiles bring 2 calues at once. Finding themselves that they are spied, they part companie with the Stags. But they againe seeing themselves forsaken, fall into a kinde of rage for heate of lust, and dig pits in the ground where they lie hidden. Then begin their muzzles to looke blacke, and so continue, vntill such time as some raine wash away that colour. The Hinds before they calue, purge themselves with the herbe Sefelis or Siler-mountain, whereby they haue lesse paine in their bearing, and more speedy and easie deliuerance. After they are lightened of their burden, they know where two herbes be, which they haue presently recourse vnto, Wake-Robin, and the foresaid Siler-mountain. When they haue eaten well thereof, they return presently to their yong. And (for what secret reason in Nature, God knowes) their first milke must haue a taste & talang of those two herbs. Their little ones they practise and exercise to vse their legs from the very beginning so soon as they be come into the world: teaching them euen then how they should run away and flie. To high and steepe cragged rockes they bring them and there shew them how to leape, and withall acquaint them with their dens and places of harborough. And now by this time, the stags being past the heat of the rut, feed apace. But so soone as they be growne very fat, they seeke lurking places, and there abide, confessing as it were how heauie and vniweldeie they be for fatnesse, and how vncommodious it is vnto them. At other times they vse in their flight to make staies, and take their breath, and as they stand still, to looke behinde them. But when they espie once the hounds and hunters to be neer vnto them then they fall to running afresh. And this they doe for a paine that they haue in their guts, which are so weak & tender, that with a small blow or stripe giuen vnto them they will burst within their bellies. When they perceiue the hunt is vp, & heare the hounds erie, they presently run but euer downe the winde, to the end that the sent of their feet should passe away with them. They take much pleasure & delight in the sound of shepheards pipes, and their song withall. When they set vp their eares, they are most quicke of hearing: when they let them hang downe, they be as deafe. Moreouer, they are very simple and foolish creatures: amused, yea, and amased they will be at every thing, and keepe a wondering at it, in so much, as if an horse, a cow, or an haifer approach neere vnto them, they will stand gazing at it, and neuer regard the hunters neere by: or if they happen to spie him, they will looke at his

his very bow, and sheine of arrows, as at strange and wondrous things. They passe the seas, swimming by flocks and whole herds in a long row, each one resting his head vpon the buttockes of his fellow next before him: and this they do in course, so as the foremost retireth behinde to the hindmost, by turnes one after another: and this is ordinarily obserued by those saylers that passe from Cilicia to Cypres. And yet in their swimming they descry no land by the eye, but only by their smelling haue an aime thereat. The males of this kind are horned, and they (aboue all other liuing creatures) cast them euery yeare once, at a certaine time of the Spring: and to that purpose a little before the very day of their mewing, they seek the most secret corners and most out of the way, in the whole Forrest. When they are pollards, they keep close hidden, as if they were difarmed: and all this they do, as if they enuid that men should haue good of any thing that they had. And in very truth, the right horn (they say) can neuer be found, as if it had some rare and singular vertue in Physicke. A strange and maruellous thing, considering that in the parks they change them euery yere, inso much as it is thought verily, that they hide them within the earth. But burne whether of them yewill, the left as well as the right, this is certain, That the smell and perfume thereof driueth serpents away, and discouereth them that are subiect to the fits of the falling diseafe. A man may also know their age by their heads, for euery yeare they haue one knag or branch more in their horns than before, vntill they come to six: after which time, they come new euer alike; so as their age cannot be discerned any more by the head, but the marke is taken by their mouth and teeth; for as they grow in age, they haue few or no teeth at all, ne yet grow the branches out at the root, whereas all the while they were younger, they vsed to haue them breake forth and standing out at the very forehead. After they be gueldd once, neither cast they their hornes which they had before, neither grow there any if they had none when they were libbed. At the first when they breake out againe, like they be to the glandules or kernels of dry skin, that new put forth: then grow they with tender stalks, in to certain round and long knobs of the reed mace, couered all ouer with a certaine soft plume downe like veluet. So long as they be destitute of their hornes, and perceiue their heads naked, they go forth to reliefe by night; and as they grow bigger and bigger, they harden them in the hot sun, eftsoons making prooffe of them against trees, and when they perceiue once that they be tough and strong enough, then they go abroad boldly. And certainly some of them haue been taken with green Iuie sticking fast and growing in their hornes, remaining there since the time that they ran them (when they were but tender) against some trees, for triall whether they were good or no, and so chanced to race the Iuie from the wood of the tree. You shall haue them sometime white of colour, and such an one was the hind that *Q. Sertorius* had about, which he perswaded the people of Spaine to be his Sooth-sayer, & to tel him of things to come. This kind of Deere maintaine fight with serpents, and are their mortall enemies: they will follow them to their very holes, and there (by the strength of drawing and snuffing vp their wind at the nostrils) force them out whether they wil or no: and therefore there is not so good a thing again to chase away serpents, as is the smoke and smel of an Harts horn burnt. But against their sting or biting, there is a singular remedy, with the runnet in the maw of a fawne or Hind-calf killed in the dams belly. It is generally held and confessed, that the Stag or hind liues long: for an hundred yeres after *Alexander* the great, some were taken with golden collars about their necks, ouergrowne now with haire and growne within the skin: which collars, the said king had done vpon them. This creature of all diseases is not subiect to the feuer, but he is good to cure it. I haue known great ladies and dames of state, vse euery morning to eat the venison of red Deere, and thereby to haue liued a great age and neuer had the ague: but it is thought this is a certain remedy and neuer faileth, in case the stag be stricken starke dead at once with one wound and no more.

CHAP. XXXIII.

¶ Of the shag-haired and bearded Stagge like to a Goat:
as also of the Chamaeleon.

OF the same kind is the Goat hart, and differing only in the beard and long shag about the shoulders, which they call *Tragelaphis*: and this breedeth no where but about the riuer *Phasis*. Africke in a manner is the onely countrey that breedeth no stags and hinds: but contrari-

A contrariwise, it bringeth *Chamaeleons*, although India hath them ordinarily in greater number. In shape and quantitie it is made like a *Lisard*, but that it standeth higher and streighter than the *Lisards* do, vpon his legs. The sides, flank, and belly, meet together, as in fishes: it hath likewise sharp prickles, bearing out vpon the back as they haue: snouted it is, for the biggesse not vnlike to a swine, with a very long taile thin and pointed at the end, winding round and entangled like to vipers: hooked clawes it hath, and goeth slow, as doth the *Tortoise*: his body and skin is rough and scaly, as the *crocodiles*: his eyes standing hollow within his head, & those be exceeding great, one neere vnto the other, with a very small portion betweene, of the same colour that the rest of the body is: he is alwaies open eyed, and neuer closeth them: he looketh about him not by mouing the ball of his eye, but by turning the whole body thereof: he gapes euermore aloft into the aire, and is the onely creature aliue that feedeth neither of meat nor drinke, but hath his nourishment of aire onely: about wilde fig-trees he is fell and dangerous, otherwise harmlesse. But his colour naturally is very strange and wonderful, for euer and anon he changeth it, as well in his eye, as taile and whole body besides: and looke what colour he toucheth next, the same alwaies he resembleth, vnlesse it be red and white. When he is dead, hee looketh pale and wan: very little flesh he hath in head and chawes, and about the ioint where his taile is grafted to his rump; but in all the body besides, none at all. All his bloud is in his heart, and about his eyes: among other his bowels, he is without a spleen. Hidden hee lieth all winter long, as *Lisards* do.

CHAP. XXXIII.

¶ Of the Buffe, or *Tarandus*: the *Lycaon*, and the *Thos*.

C IN Scythia there is a beast called *Tarandus*, which changeth likewise colour as the *Chamaeleon*: and no other creature bearing haire doth the same, vnlesse it be the *Lycaon* of India: which (by report) hath a maned necke. As for the *Thoes* (which are a kinde of wolues somewhat longer than the other common wolues, and shorter legged, quicke and swift in leaping, liuing altogether of the venison that they hunt & take, without doing any harme at all to men) they may be said, not so much to change their hew, as their habit and apparell: for all winter time they be shag-haired, but in summer bare and naked. The *Tarandus* is as big as an ox, with an head not vnlike to a stags, but that it is greater, namely carrying branched hornes: cloven hoofed, and his haire as deep as is the *Bear*. The hide of his backe is so tough and hard, that thereof they make brest-plates. He taketh the colour of all trees, shrubs, plants, floures, and places wherein he lieth when he retireth for feare, and therefore seldome is he caught. But when he list to looke like himselfe and be in his owne colour, he resembleth an *Asse*. To conclude, strange it is that the bare body of a beast should alter into so many colours: but much more strange it is and wonderfull, that the haire also should so change.

CHAP. XXXV.

¶ Of the *Pork-pen*.

E THE *Porkpens* come out of India and Africke: a kind of *Vrchin* or hedge-hog they be: armed with prickles they be both; but the *Porkpen* hath the longer sharp pointed quilles, and those, when he stretcheth his skin, he fendeth and shooteth from him: when the hounds presseth hard vpon him, he flieth from their mouthes, and then takes vantage to launce at them somewhat farther off. In the Winter he lieth hidden, as the nature is of many beasts to doe, and the *Bears* about the rest.

CHAP. XXXVI.

¶ Of the *Bears*, and how they breed and bring forth their young.

F THEY ingender in the beginning of winter, not after the common manner of other four-footed beasts, but lying both along, clasping and embracing one another: then they goe apart into their dennes and caues, where the she beare thirtie daies after is discharged of her burden, and bringeth forth commonly fve whelps at a time. At the first, they seem to be a lump

Jump of white flesh without all form, little bigger than rattons, without eies, & wanting haire: only there is some shew and apparance of claws that put forth. This rude lump, with licking they fashion by little & little into some shape; & nothing is more rare to be seen in the world, than a she beare bringing forth her yong: and this is one cause that the male beares are not to be seen in 40 daies, nor the female for 4 moneths. If they haue no holes and dens for the purpose, they build themselves cabbins of wood, gathering together a deale of boughes & bushes, which they couch and lay artificially together, to beare off any shower, so as no raine is able to enter; and those they strew vpon the floore with as soft leaues as they can meet withall. For the first 14 daies (after they haue taken vp their lodging in this manner) they sleep so soundly, that they cannot possibly be wakened, if a man should lay on and wound them. In this drowsinesse of theirs, they grow wondrous fat. This their grease and fat thus gotten, is it that is so medicineable, and good for those that shed their haire. These 14 days once past, they sit vpon their rump or buttocks, and fall to sucking of their fore-feet, and this is all their food wherof they liue for the time. Their yong whelpes, when they are starke and stiffe for cold, they huggle in their bosom and keep close to their warm breast, much like to birds that sit vpon their eggs. A strange and wonderful thing it is to be told, and yet *Theophrastus* belecueth it, That if a man take bears flesh during those daies, and seeth or bake the same, if it be set vp and kept safe it will grow neuertheless. All this time they dung not, neither doth there appeare any token or excrement of meat that they haue eaten: and very little water or aquositie it found within their belly. As for blood, some few small drops lie about the heart only, and none at all in the whole body besides. Now when spring is come, forth they go out of their den, but by that time the males are exceeding ouergrown with fat: and the reason therof cannot be readily rendred: for as we said before, they had no more but that fortnights sleep to fat them withall. Being now gotten abroad, the first thing that they do, is to deuoure a certain herbe named *Aron*, *i. Wake-robin*, and that they do to open their guts, which otherwise were clunged and grown together: and for to prepare their mouths and teeth again to eat, they whet and set the edge of them with the yong shoots and tendrons of the briers and brambles. Subiect they are many times to dimnesse of sight: for which cause especially they seek after hony combs, that the bees might settle vpon them, and with their stings make them bleed about the head, and by that means discharge them of that heauinesse which troubleth their eies. The Lions are not so strong in the head, but beares bee as weak and tender there: and therefore when they be chafed hard by hunters, & put to a plunge, ready to cast themselves headlong from a rocke, they couer and arme their heads with their fore-feet and pawes, as it were with hands, and so jump downe: yea and many times, when they are baited in the open shew-place, we haue known them laid streaking for dead with one cuffe or box of the eare giuen them with a mans fist. In Spain it is held for certain, that in their brain there is a venomous qualitie; and if it be taken in drinke, driueth men into a kind of madnesse, so as they will rage as if they were bears: in token whereof, whensoever any of them be killed with baiting, they make surework and burn their heads all whole. When they list, they will go on their two hinder feet vp right; they creep down from trees backward: when they fight with bulls, their manner is to hang with all their foure feet, about their head and hornes, and fowith the very weight of their bodies wearie them. There is not a liuing creature more craftie and foolish withall, when it doth a shrewd turne. We finde it recorded in the *Annales of the Romans*, that when *M. Piso* and *M. Messalawere* Consuls, *Domitius Anobarbus* an *Edile Curule*, vpon the 14 day before the Calends of October, exhibited 100 Numidian beares to be baited & chafed in the great Cirque, and as many *Ethiopian* hunters. And I maruell much, that the *Chronicle* nameth Numidian, since it is certain, that no beares come out of Africke.

CHAP. XXXVII.

¶ Of the Rats of Pontus, and the Alps: also of Vrchins and Hedge-hogs.

THE Rats of Pontus, which be onely white, come not abroad all winter: they haue a most fine and exquisite taste in their feeding; but I wonder how the authours that haue written this, should come to the knowledge of so much. Those of the Alps likewise, *i. Marmotanes*, which are as bigge as Brocks or Badgers, keepe in, during winter: but they are provided of

A of victuals before hand which they gather together and carry into their holes. And some say, when the male or female is loden with grasse and herbs, as much as it can comprehend within all the foure legges, it lieth vpon the backe with the said prouision vpon their bellies, and then commeth the other, and taketh hold by the taile with the mouth, and draweth the fellow into the earth: thus doe they one by the other in turnes: and hereupon it is, that all that time their backs are bare and the haire worne off. Such like *Marmotanes* there be in *Egypt*; and in the same manner they sit ordinarily vpon their buttocks, and vpon their two hinder feet they goe, vning their fore-feet in stead of hands.

Hedgehogs also make their prouision before-hand of meat for winter, in this wise. They wal-low and roll themselves vpon apples and such fruit lying vnder foot, and so catch them vp with their prickles, & one more besides they take in their mouth, & so carry them into hollow trees. By stopping one or other of their holes, men know when the wind turneth, and is changed from North to South. When they perceiue one hunting of them, they draw their mouth and feet close together with all their belly part, where the skin hath a thin downe and no prickles at all to do harme, and so roll themselves as round as a foot-ball, that neither dog nor man can come by any thing but their sharpe-pointed prickles. So soon as they see themselves past all hope to escape, they let their water go & pisse vpon themselves. Now this vrine of theirs hath a poisonous qualitie to rot their skin and prickles, for which they know well enough that they be chafed and taken. And therefore it is a secret and speciall policie, not to hunt them before they haue let their vrine go; and then their skin is very good, for which chiefly they are hunted: otherwise it is nought euer after, and so rotten, that it will not hang together, but fall in pieces: al the prickles shed off, as being putrified, yea although they should escape away from the dogs and liue still: and this is the cause that they neuer bepisse and drench themselves with this pestilent excrement, but in extremitie & vtter despaire: for they cannot abide themselves their owne vrine, of so venomous a qualitie it is, & so hurtfull to their own body; and do what they can to spare themselves, attending the vtmost time of extremitie, inso much as they are ready to be taken before they do it. When the Vrchin is caught aliue, the deuise to make him open again in length, is to besprinkle him with hot water; and then by hanging at one of their hinder feet without meat they die with famine: otherwise it is not possible to kill them and saue their case or skin. There be writers who bash not to say, That this kinde of beast (where not those prickles) is good for nothing, and may well be missed of men: and that the soft fleece of wooll that sheepe bear, but for these prickles were superfluous & to no purpose bestowed vpon mankind: for which the rough skin of these Vrchins, are brushies & rubbers made to brush & make cleane our garments. And in very truth, many haue gotten great gain & profit by this commodity & merchandise, and namely, with their crafty deuise of monopolies, that all might passe through their hands only: notwithstanding there hath not bin any one disorder more repressed and reformation sought by sundry edicts and acts of the Senate in that behalfe: euery prince hath been continually troubled hereabout with grieuous complaints out of all prouinces.

CHAP. XXXVIII.

¶ Of the Leontophons, the Onces, Badgers, and Squirrels.

Two other kinds there be of beasts, whose vrine worketh strange and wonderfull effects. The one is called *Leontophonos*, and he breeds in no country but where there be lions: a little creature it is, but so venomous, that the lion (king of beasts, before whom all others tremble) for all his might and puissance, dieth presently if he taste neuer so little thereof. And therefore they that chase the lion, get all the *Leontophones* that they can come by, burne their bodies, and with the powder of them bestrew & season as it were the pieces of other flesh that they lay for a bait in the Forrest, and thus with the very ashes (I say) of his enemy, kill him: and deadly and pernicious is it to the lion. No maruile therefore if the lion abhor & hate him, for so soon as he espieth him, he crushes him with his pawes, and so killeth him without setting tooth to his body. The *Leontophone* for his part againe, is as ready to bedrench him with his vrine, knowing right well that his pisse is a very poison to the Lion.

In those countries were the Onces breed, their urine (after it is made) congealeth into a certain ycie substance, & waxes drie, & so it comes to be a certain pretious stone like a carbuncle, glit-

Or rather instead of teeth that sharme men vic.

glittering and shining as red as fire, and called it is *Lyncurium*. And vpon this occasion many haue writtē, that Amber is ingendred after the same maner. The Onces knowing thus much, for very spight and enuie, couer their vrine with mold or earth, and this maketh it so much the sooner to harden and congeale.

The Grayes, Polcats, or Brocks, haue a cast by themselves, when they be affraid of hunters: for they will draw in their breath so hard, that their skin being stretched and puffed vp withall, they will auoid the biting of the hounds tooth, and checke the wounding of the hunter; so as neither the one nor the other can take hold of them.

The Squirrels also foresee a tempest comming, and where the wind will blow: for looke in what corner the wind is like to stand, on that side they stop vp the mouth of their holes, and make an ouerture on the other side against it. Moreouer, a goodly broad bush taile they haue, wherewith they couer their whole body. Thus you see how some creatures prouide victuals against winter, others battle and feed with sleepe onely.

CHAP. XXXIX.

¶ Of the Viper, Land-winkles or Snailles, and Lizards.

Of all other serpents, it is said, that the Viper alone lies hidden in the ground during winter, whereas the rest keepe within crannies and clefts of trees, or else in the hollow chinkes of stones: and otherwise they are able to endure hunger a whole yeere, so they be kept from extreame cold: All the while during their retreat and lying close within, they sleepe as if they were dead and deprived of their power to poyson.

In like manner do Perwinkles and Snailles; but not onely in the winter season, but in Summer againe they lie still, cleauing so hard to rocks & stones, that although by force they be plucked off and turned with their bellies vpward, yet they will not out of their shell. In the Baleare Islands there be a kinde of them called *Cauaticæ*, which neuer creepe out of their holes within the ground, neither liue they of any grasse or greene herbe, but hang together like clusters of grapes. Another sort there is of them, but not so common, hiding themselves within the couer of their shell, sticking euer fast vnto them: these lie alwaies vnder the ground, and were in times past digged vp onely about the Alpes, along the maritime coasts: but now of late they be discovered in Veliternum also, where men begin to get them out of the earth. But the best of them all and most commendable, are those in the Island *Astypelæa*.

As touching Lizards (deadly enemies to the Snailles or Winkles above-named) men say they liue not aboue six moneths. In Arabia, the Lizards be a cubit in length: and in the mountain Nifa of India, they be foure and twenty foot long; some tawnie, some light red, and others blew of colour.

CHAP. XL.

¶ Of Dogges.

Among those domesticall creatures that conuersed with vs, there be many things worth the knowledge: and namely, as touching dogges (the most faithfull and trustie companions of all others to a man) and also horses. And in very truth, I haue heard it credibly reported, of a dogge, that in defence of his master, fought hard against theues robbing by the high way side: & albeit he were forewounded euen to death, yet would he not abandon the dead body of his master, but draue away both wild foule and sauage beast, from seizing of his carcasse. Also of another in Epirus, who in a great assembly of people knowing the man that had murdered his M^r. flew vpon him with open mouth, barking and snapping at him so furiously, that he was ready to take him by the throat, vntill he at length confessed the fact that should cause the dog thus to rage and some against him. There was a king of the Garamants exiled, and recovered his royall state againe by the meanes of 200 dogges that fought for him against all those that made resistance, and brought him home maugre his enemies, The Colophonians and Castabaleans, maintained certain squadrons of mastiue dogs, for their war seruice: and those were put in the vaward to make the head and front of the battell, and were neuer knowne to draw back and refuse fight. These were their trustiest auxiliaries and aid-soldiers, and neuer so needye

as

as to call for pay. In a battell when the Cimbrians were defeated and put all to the sword, their dogges defended the baggage, yea, and their houses (such as they were) carried ordinarily vpon charriots. *Iason* the Lycian had a dogge, who after his master was slaine, would neuer eat meate, but pined himselfe to death. *Duris* maketh mention of another dogge, which he named *Hircanus*, that so soone as the funerall fire of king *Lyfimachus* his master was set a burning, leapt into the flame. And so did another at the funerals of king *Hiero*. Moreouer, *Phylistus* reporteth as strange a story of king *Pyrrhus* his dogge: as also of another belonging to the tyrant *Gelo*. The Chronicles report of a dog that *Nicomedes* king of Numidia kept, which flew vpon the queene *Consingis* his wife, & al to mangled and worried her, for toying and dallying ouerwantonly with the king her husband. And to goe no farther for examples, euen with vs here at Rome, *Voleatius* a noble gentleman (who taught *Cecilius* the ciuile law) as he returned home one euening late, riding vpon an hackney from a village neere the citie, was assailed by a theefe on the high way, but he had a dog with him that saued him out of his hands, *Celcius* likewise, a Senator of Rome, lying sicke at Plaifance, chanced to be assailed by his enemies, well appointed and armed; but they were not able to hurt and wound him, by reason of a dog that he had about him, vntill such time as they had killed the said dog. But this passeth al, which happened in our time, and standeth vpon record in the publicke registers, namely, in the yeere that *Appius Iunius* and *P. Silus* were Consuls, at what time as *T. Sabinius* and his seruants were executed for an outrage committed vpon the person of *Nero*, sonne of *Germanicus*: one of them that died had a dog which could not be kept from the prison dore, and when his master was throwne down the staires (called *Scala Gemonia*) would not depart from his dead corps, but kept a most pittieous howling and lamentation about it, in the sight of a great multitude of Romanes that stood round about to see the execution and the manner of it: and when one of the companie threw the dogge a peece of meat, he straightwaies carried to the mouth of his master lying dead. Moreouer, when the carcasse was thrown into the riuer *Tiberis*, the same dog swam after, & made all the means he could to beare it vp afoote that it should not sink: and to the sight of this spectacle and fidelitie of the poore dogge to his master, a number of people ran forth by heapes out of the citie to the water side. They be the onely beasts of all others that know their masters; and let a stranger vnknown be come neuer so suddenly, they are ware of his comming, and will giue warning. They alone know their owne names, and all those of the house by their speech. Be the way neuer so long, and the place from whence they came neuer so farre, they remember it, and can go thither againe. And surely, setting man aside, I know not what creature hath a better memorie. As furious and raging as they be otherwhiles, yet appeased they will be and quieted, by a man sitting down vpon the ground. Certes, the longer we liue, the more things we obserue & marke still in these dogges. As for hunting there is not a beast so subtle, so quick, & so fine of sent, as is the hound: he hunteth and followeth the best by the foot, training the hunter that leads him by the collar and leash, to the very place where the beast lieth. Hauing once gotten an eie of his game, how silent & secret are they notwithstanding? and yet how significant is their discouerie of the beast vnto the hunter? first with wagging their taile, and afterwards with their nose and snout, snuffing as they doe. And therefore it is no maruell, if when hounds or beagles be ouer old, wearie, and blind, men carry them in their armes to hunt, for to wind the beast, and by the verie sent of the nose to shew and declare where the beast is at harbour. The Indians take great pleasure to haue their salt bitches to be lined with tygres: and for this purpose, when they goe proud, they couple and tie them together, and so leaue them in the woods for the male tygres: howbeit they reere neither the first nor second litter of them, supposing that the dogs thus bred, will be too fierce and eger, but the third they nourish and bring vp. Semblably, thus doe the Gauls by their dogges that are ingendred of wolues: and in euery chace and Forrest there be whole flockes of them thus ingendred, that haue for their guide, leader, and captain, one dogge or other: him they accompanie when they hunt; him they obey and are directed by: for surely, they keepe an order among themselves, of gouernment and mastership. This is knowne for certaine, that the dogges which be neere vnto Nilus, lap of the riuer, running still and neuer stay while they are drinking, because they will giue no vantage at all to be a prey vnto the greedie Crocodiles. In the voiage that *Alexander* the Great made into India, the king of Albania gaue him a dogge of an huge and extraordinarie bignesse. And *Alexander* taking great delight and contentment to see so goodly and so faire a dogge, let loofe vnto him first Beares, afterwards

V 2

wild

wild Bores; and last of all, fallow Deere. But this dog making no reckoning of all this game, lay still couchant, and neuer stirred nor made at them. This great Commander *Alexander*, a man of mighty spirit and high mind, offended at the laziness and cowardise of so great a bodie, commanded that he should be killed, and so he was. Newes hereof went presently to the king of Albanie. Whereupon he sent vnto him a second dog, with this message, That he should not make triall of this too against such little beasts, but either set a Lion or an Elephant at him: saying moreover, that hee had in all but those two of his kinde: and if hee were killed likewise, hee were like to haue no more of that race and breed. *Alexander* made no stay, but presently put out a Lion, and immediately he saw his backe broken and all to rent and torne by the dog. Afterwards he commanded to bring forth an Elephant, and in no sight tooke he greater pleasure, than in this. For the dog at the first with his long rough shagged haire, that ouerspread his whole bodie, came with full mouth thundering (as it were) and barking terribly against the Elephant. Soon after he leaped and flieth vpon him, rising and mounting against the great beast, now of one side, then of another: maintaining combat right artificially, one while assailing, another while auoiding his enemy: and so nimble he bestirreth him from side to side, that with continuall turning about to and fro, the Elephant grew giddie in the head, in so much as he came tumbling downe, and made the ground to shake vnder him with his fall. Bitches breed and beare young euery yeere lightly once: and the due time for them to be with whelpes is when they are full a yeere old. They goe with young threescore daies. Their puppies come blinde into the world: and the more milke they sucke, the later it is ere they receiue their sight: but as it is neuer above twenty daies ere they see, so they open not their eyes vnder seven daies old. Some say, that if a bitch bring but one at a litter, it will see by nine daies: if twaine, it will be ten daies first: and the more puppies she hath, the more daies it will be in that proportion ere they see. Moreover, that the bitch-whelpes that commeth of the first litter, see strange bugs and goblins. The best of the whole litter is that whelpes that is last ere it begin to see: or else that which the bitch carries first into her kennell. The biting of mad dogs are most dangerous to a man, as we haue said before, especially during the dog-daies, while the dog star Syrius is so hot: for they that are so bitten, lightly are affraid of water, which is a deadly signe. To preuent therefore that dogs fall not mad, it is good for thirtie or fortie daies space, to mingle hens or pullins dung especially with their meat: againe, if they be growing into that rage, or tainted already, to giue them Ellebor with their meat.

CHAP. XLI.

¶ Against the biting of a mad Dog.

The sure and soueraigne remedy for them that are bitten with a mad dog, was reuealed lately by way of Oracle: to wit, the root of a wild rose, called the sweet brier or Eglantine. *Columella* writeth, That when a whelpes is iust fortie daies old, if his taile be bitten off at the nethermost joint, and the sinew or string that commeth after, be likewise taken away, neither the taile will grow any more, nor the dog fall euer to be mad. I haue my selfe obserued, that among the prodigies it is reported, how a dog sometime spake, as also that a serpent barked, that yeere when *Tarquinius* the proud was deposed and driuen out of Rome.

CHAP. XLII.

¶ Of Horses, and their nature.

The same *Alexander* the Great, of whom ere-while we spake, had a very strange and rare horse, whom men called Bucephalus, either for his crabbed and grim looke, or else of the marke or brand of a bulls head, which was imprinted vpon his shoulder. It is reported, that *Alexander* being but a child, seeing this faire horse, was in loue with him, and bought out of the breed and race of *Philonicus* the Pharfalian, and for him paid sixteene talents. He would suffer no man to sit him, nor come vpon his backe, but *Alexander*; and namely, when he had the kings saddle on, and was also trapped with roiall furniture: for otherwise he would admit any whomsoever. The same horse was of a passing good and memorable seruice in the warres: and namely, being wounded vpon a time at the assault of Thebes, he would not suffer *Alexander* to alight

A alight from his back, and mount vpon another, Many other strange and wonderfull things hee did: in regard whereof, when he was dead, the king solemnized his funerals most sumptuously, erected a tombe for him, and about it built a city that bare his name, Bucephalia. *Cesar* Dictator likewise had another horse that would suffer no man to ride him but his maister: & the same horse had his forefeet resembling those of a man: and in that manner he stands pourtraied before the temple of *Venus*, Mother. Moreover, *Augustus Caesar*, late Emperour of famous memory, made a sumptuous tombe for an horse that he had, whereof *Germanicus Caesar* compiled a poeme. At *Agrigentum* there be seen Pyramids ouer many places where horses were entombed. *Iuba* reporteth, That queene *Semiramis* loued a great horse that she had, so far forth, that she was content he should doe his kind with her. The Scythians verily take a great pride and glorie much in the goodnes of their horses and Caualerie. A king of theirs happened in combat and single fight vpon a challenge to be slain by his enemy, and when he came to despoile him of his armes and roiall habit, the kings horse came vpon him with such furie, flinging and laying about him with his heeles, and biting withall, that he made an end of the conquerour champion. There was another great horse hoodwinked because he should couer a mare: but perceiuing after that he was vnhooded that he serued as a stallion to his own dam that, soled him, ran vp to a steep rock with a downfall, and there for grieffe cast himselfe down and died. We find also in record, That in the territorie of Reate there was a mare killed & all to rent an horsekeeper vpon the same occasion. For surely these beasts know their parentage, & those that are next to them in blood. And therefore we see that the colts will in the flocke more willingly keep company and fort with their sisters of the former yere, than with the mare their mother. Horses are so docile, and apt to learne, what we find in histories, how in the army of *Sibaritanes*, the whole troupe of horsemen had their horses vnder them, and vsed to leap and daunce to certaine musike that they were wonted and accustomed vnto. They haue a fore-knowledge when battell is toward, they will mourne for the losse of their maisters: yea, and other whiles shed teares and weep pitifully for loue of them. When king *Nicomedes* was slaine, the horse for his owne saddle, would neuer eat meat after, but for very anguish died with famine. *Philarchus* reporteth, That king *Antiochus* hauing in battaile slaine one *Centaretus*, a brave horsman of the Gallogreeks or Galatians, became maister of his horse, and mounted vpon him in triumphant wise: But the horse of him that lay dead in the place, and vpon whom *Antiochus* was mounted, for very anger and indignation at this indignitie, passed neither for bit nor bridle, so as he could not be ruled; and so ran furiously among the craggies and rocks, where both horse and man came downe headlong, and perished both together. *Philistus* writeth, That *Dyonisius* was forced to leaue his horse sticking fast in a quae-mire, and got away: but the horse after he had recovered himselfe, and was gotten forth, followed the tracks of his master, with a swarm or cast of bees serling in his mane: and this was the first presage of good fortune that induced *Denis* to vsurp the kingdome of Sicilie. Of what perceiuaunce and vnderstanding they be, it cannot be exprest: & that know those light horsmen full well that vse to launce darts and iauelines from horseback, by the hard seruice that they put their horses to; which they doe with great dexteritie & resolution in straining, winding, and turning their bodies nimble euery way. Nay, ye shall haue of them to gather vp darts and iauelines from the ground, and reach them againe to the horsman. And commonly we see it to be an ordinary matter with them in the great race or shew place, when they are set in their geirs to draw the chariots, how they ioy when they are encouraged and praised; giuing no doubt a great prooffe, and confessing that they are desirous of glorie. At the secular solemnities, exhibited by *Claudius Caesar*, in the Circensian games, the horses with the white liuery (notwithstanding their driuer and gouernour, was cast and flung to the ground even within the bars) wan the best prize & went away with the honour of that day. For of themselves they brake and bare down whatsoeuer might impeach them of running the race thoroughout: they did all that euer was to be done against their concurrents and aduersaries of the contrarie side, as well as if a most expert chariot-man had been ouer their backes to direct and instruct them. At the sight whereof, men were ashamed to see their skill & art to be ouermatched & surmounted by horses. And to conclude, when they had performed their race, as much as by law of the game was required, they stood still at the very goale, and would no farther. A greater wonder and presage was this in old time, that in the Circensian games exhibited by the people, the horses after they had flung and cast their gouernour, ran directly vp to the Capitol, as well as if he

had stood still in his place, and conducted them; and there fetcht three turnes round about the temple of *Iupiter*. But the greatest of all was this which I shall now tell, That the horses of *Ratumenus*, who had won the price in the horse-running at *Veij*, threw their M^r. down; and came from thence, euen out of *Tuscane*, as far as to the foresaid Capitoll, carrying thither the *Palme* branch and chaplet of *Victory* won by *Ratumenus* their M^r. of whom the gate *Ratumena* took afterwards the name at *Rome*. The *Sarmatians* minding to take a great iournie, prepare their horses two daies before, and giue them no meat at all, only a little drinke they allow them, and thus they will ride them gallop 150 miles an end, and neuer draw bridle. Horses liue many of them 50 yeres, but the mares not so long. In fūe yeres they come to their full growth, whereas stone horses grow one yere longer. The making of good horses indeed, and their beautie, such as a man will chuse for the best, hath bin most elegantly and absolutely described by the Poet *Virgill*. And somewhat also haue I written of that argument, in my booke which I lately put forth, as touching *Tournois* and shooting from horsebacke: and in those points required, and there set downe, I see all writers in manner to agree. But for horses that must be trained to run the race, some considerations are to be had and obserued, different from horses of other vse and seruice. For whereas to other affaires and imployments they may be brought when they are two yeres old colts, and not vpwārd; to the *Lits* they must not be brought to enter into any maistris there, before they be full fūe yeres of age. The female in this kind go eleuen months compleat with young, and in the twelfth they foale: commonly the stallion and the mare are put together, when both of of them are full two yeres old: and that about the Spring *Equinocti- all*, that is to say, in mid-March: but if they be kept asunder vntill they are full 3 yeres of age, they breed stronger colts. The Stallion is able to get colts vntill he be three and thirtie yers old, for commonly when they haue serued in the race, and run full twenty yeres, they are discharged from thence, & let go abroad for to serue mares. And men say that they will hold to 40 yeres with a little helpe put to the forepart of his body, that he may be lifted vp handfomly to couer the mare. Few beasts besides are lesse able to ingender and leape the female often, nor sooner haue enough of them. For which cause they be allowed some space between euery time that they do their kind. And in one yere the most that the Stallion is able to do that way, is to couer 15 mares, and that is somewhat with the oftenest. If ye would coole the courage, & quench the lust of a mare, share and clipper mane. And yet are mares sufficient to beare euery yere, vntill they came to fortie. It is reported that an horse hath liued 75 yeres. Mares only of all other females, are deliuered of their foles, standing on their feet: but loue them more than any other doe their young. These foles verily, by report, haue growing on their forehead, when they be newly come into the world, a little blacke thing of the bignesse of a fig, called *Hippomanes*, & it is thought to haue an effectuall vertue to procure and win loue. The dam hath not so soon foled, but she bites it off, and eats it her selfe: and if it chance that any bodie prevents her of it, and catcheth it from her, she will neuer let the foal sucke her. The verie smell and sent thereof, if it be stollen away, will driue them into a fit of rage and madnesse. If peradventure a young foal lose the damme, the other mares of the common heard that are milch nurses, giue their teates to this poore orphan, and reare it vp in common. They say that for 3 daies after they be newly foled, the yong colts canot lay their mouth to the ground, and touch it. Moreover, the hotter stomacked that a horse is, the deeper he thrusteth his nose into the water as he drinks. The *Scythians* chuse rather to vse their mares in war-seruice than their stone-horses: the reason is this, that their staling is no hinderance to their pace in running their carriere, as it doth the horse, who must needs then stand still. In *Portugall*, along the river *Tagus*, & about *Lisbon*, certaine it is, that when the west-wind blowes, the mares set vp their tails, and turne them full against it, and so conceiue that genitall aire in steed of naturall seed: in such sort, as they become great withall, and quicken in their time, & bring forth foles as swift as the wind, but they liue not aboue three yeres. Out of the same *Spain*, from the parts called *Gallicia* and *Asturia*, certaine ambling iennets or nags are bred, which wee call *Thieldones*: and others of lesse stature & proportion euery way, named *Asturcones*. These horses haue a pleasant pace by themselves differing from others. For albeit they be put to their full pace, a man shall see them set one foot before another so deftly and roundly in order by turnes, that it would do one good to see it: and hereupon horse-breakers (masters) haue an art by cords to bring a horse to the like amble. A horse is subiect to the same diseases in maner that a man is: & besides, to the running of

A of the bladder: like as all other beasts that labour either in draught or carriage:

CHAP. XLIII.

¶ Of Asse.

Varro writes, That *2. Axius* a Roman Senator bought an Asse which bought him 400000 Sesterces, a price in my conceit aboue the worth of any beast whatsoever: & yet (doubtlesse) he was able to do wondrous good seruice in carrying burdens, plowing of ground, and principally in getting of mules. The chapmen that vse to buy these Asse haue a speciall regard to the place from whence they come, and where they be bred: for in *Achaia* or *Greece* those of *Arcadia* be in greatest request: and in *Italy* those of *Reate*. This creature of all things can worst away with cold; which is the cause that none of them are bred in *Pontus*. Neither do they ingender as other such like beasts, in the Spring *Equinocti- all*, about mid-March, but in mid-Iune, about the time of the Sun-stead, when daies be at the longest. He Asse, the more you spare them in their worke, the worse they are for it. The females are at the least 30 months or two yeres and halfe old before they bring any yong; but 3 yeres is the ordinarie and due time indeed. They go as long as mares, and iust so many moneths, and after the same maner do they foale. But after they be couered, they must be forced to run presently, with beating & laying on them, or else they will let go their seed again, so slippery is their wombe, and so vnapt to keep that which once it hath conceiued. They are seldome seene to bring forth two at once. The she Asse when she is about to foale seeketh some secret blinde corner to hide her selfe, that she might not be seen of any man. She breeds all her life time, which commonly is vntill shee be 30 yeres old. They loue their yong foles exceeding well, but as ill or rather worse can they abide any water. To their little ones they will go through fire, but if there be the least brooke or rill between, they are so afraid of it, that they dare not once dip their feet therein. And verily drinke they will not, but of their accustomed fountaines within the pastures where they vse to go: but they will be sure to chuse their way, and go dry-foot to their drinke, and not wet their hoofs: neither will they go ouer any bridges, where the planks are not so close drawn together and ioyned, but that they may see the water through vnder their feet, or the railes of each side so open that the riuier is seene. A strange nature they haue by themselves. Thirsty they are: but be they neuer so dry, if you change their watering place (as in traouelling vpon the way) they must be forced to drinke with cudgels, or else vnloaden of their burdens. Wherefoeuer they be stabled, they loue to lie at large and haue roome enough. For in their sleep they dream, & haue a thousand phantasies appearing to them; insomuch as they sling about them with their heeles euery way: now if they were not at libertie, and had not void space enough, but should beat against some hard thing in their way, they would soone be lame and halt withall. They be very gainfull and profitable to their masters, yeelding more commoditie than the reuenues of good farme. It is well knowne, that in *Celtiberia* a she Asse ordinarily with very breeding may be worth vnto them 400000 Sesterces. For the soling and bringing forth of the mules, the chief thing to be regarded in the she Asse, is the haire about the eares and eie lids. For howsoeuer the whole body besides be of one and the same colour, yet shall the mules foled haue as many colours as were there, all ouer the skin. *Mecenas* was the first, that at feasts made a daintie dish of yong Asse foles, and preferred their flesh in his time before the venison of wild Asse. But he being dead, they were not thought so good meat, nor accepted at all. If an Asse be seene to die, looke soon after that the whole race and kind of them will follow to the very last.

CHAP. XLIV.

¶ Of Mules.

Between the he Asse and a Mare is a Mule ingendred, and foled in the 12 moneths: a beast of exceeding strength to beare out all labor and trauell. For breeding of such Mules, Mares are chosen that are not vnder foure yeres old, nor aboue ten. Men say, that they will driue away one another in both kinds, and not accompany together, vnlesse they tasted the milk and suckd the damme when they were yong, of that kinde which they would couer. And for this purpose

purpose they vse to steale away either the yong Assc soles, and set them in the dark to the teats of the Mare, or els the yong colts to suck of the she Assc. For there is a kind of Mule also that comes of a stone horse and a female Assc: but of all others they be vntoward and vnruely, and so slow withall, that it is vnpossible to bring them to any good seruice: and much more (as all things else) if they be far in age when they ingender. If when a she Assc hath taken the horse and be sped, there come an Assc and couer her againe, she will cast her fruit vntime, and lose all: but it is not so if an horse couer her after an Assc. It is noted & found by experience, that seuen daies after an Assc hath soled, is the best time to put the male vnto her, and then soonest will she be sped: as also, that the he Asses being wearie with trauel, wil better couer the femals than otherwise being resty. That Assc is held for barren, which is not couered, nor conceiueth, before she haue cast her sucking or soles teeth, whereby the age is known: as also she that standeth not to the first couering, but loseth it. In old time they vsed to call those Hinuli which were begotten betweene a horse and an Assc: and contrariwise Mules, such as were ingendred of an Assc and a Mare. Moreouer this is obserued, that if two beasts of diuers kindes ingender, they bring forth one of a third sort, and resembling none of the parents: also, that such begotten in this maner, what kind of creatures soeuer they be, are themselves barren and fruitles, vnable either to beare or beget yong. And this is the cause that the mules neuer breed. We finde verily in our Chronicles, that oft times Mules brought forth yong soles, but it was alwaies taken for a monstrous and prodigious signe. And yet *Theophrastus* saith, that in Cappadocia ordinarily they do beare and bring forth soles: but they are a kind by themselves. Mules are broken of their flinging and wincing, if they vse often to drinke wine. It is found written in many Greeke authors, that if an he Mule couer a Mare, there is ingendred that which the Latins call Hinnus, that is to say, a little Mule. Between Mares and wild Asses made tame, there is ingendred a kind of Mules very swift in running, and exceeding hard hoofed, lanke and slender of bodie, but fierce and courageous, and vnneeth or hardly to be broken. But the Mule that comes of a wild Assc and a female tame Assc, passeth all the rest. As for wild asses, the very best & floure of them be in Phrygia and Lycaonia. In Africke the flesh of their soles is held for excellent good meat, and such they cal Lalisones. It appeares in the Chronicles of Athens, That a mule liued 80 yeares. And reported thus much there is of it, That when they built the temple within the citadel thereof, this old Mule being for age able to do nothing els, would yet accompanie other Mules that laboured and caried stones thither, and if any were ready to fall vnder their lode, would seeme to relieue and hold them vp, and as it were encourage them to his power: inasomuch as the people tooke for great delight and pleasure therein, that they made a decree and took order, that no corn-masters that bought and sold graine should beat this mule from their ranging fires, when they elensd or winnowed their corne, but that he might eat vnder them.

CHAP. XLV.

Of Buls, Kine, and Oxen.

The Bœufs of India are as high by report as Camels, and foure foot broad they are betwixt the horns. In our part of the world those that come out of Epirus are most commended, and beare the greatest price aboue all others, and namely those which they say are of the race & breed of king *Pyrrhus*, who that way was very curious. For this prince because he would haue a principall good breed, would not suffer the Buls to come vnto the kine and season them before they were both foure yeares old. Mighty big they were therefore, and so they continue of that kind vnto this day. Howbeit, now when they be but heifers of one yeare, or two yeares at the most (which is more tolerable) they are let go to the fellow and breed. Buls may wel ingender and serue kine when they be 4 yeares old; and one of them is able all the yeare long to goe with ten kine and serue their turne. They say moreouer, that a Bull after he hath leapt a Cow, and done his kind, if he go his way toward the right hand, he hath gotten an oxe calfe, but contrariwise a cow calfe if he take the left hand. Kine commonly take at their first seasoning, but if it chance that they misse and stand not to it, the 20 day after they seeke the fellow, and goe a bulling againe. In the tenth moneth they calue, and what soeuer falleth before that terme, neuer proueth nor commeth to good. Some write, That they calue iust vpon the last day of the tenth moneth complete. Seldome bring they forth two calves at a time. Their seasoning time commonly

A commonly continueth 30 daies, namely from the rising of the Dolphin starre, vnto the day before the Nones of Ianuarie: howbeit some there be that go to fellow in Autumne. Certes in those countries where the people liue altogether of milke, they order the matter so, that their kine calue at all times, so as they are not without their food of fresh milke all the yeare long. Bulls willingly leape not about two kine at most in one day. Bœufes alone of all liuing Creatures can graze going backward, and verily among the Gamarants they neuer feed otherwise. Kine liue not about 15 yeares at the vtmost: bulls and oxen come to 20: they be at their full strength when they are 5 yeares old. It is said that they will grow fat if they be bathed with l or water, or if a man slit their hide, and with a reed or pipe blow wind betweene the flesh and the skin, euen into their intrals. Kine, Buls, and Oxen are not to be despised as vnkindely, although they look but illfauredly, and be not so faire to the eie; for in the Alpes the least of bodie are the best milch kine: and the best laboring oxen are they which are yoked by the head, and not the neck. In Syria they haue no dewlaps at all hanging vnder the necke, but bunches standing vp on their backs in stead thereof. They of Caria also, a country of Asia, are illfaured to sight, hauing betweene their neckes and shoulders a tumor or swelling hanging ouer; besides, their horns are loose, and as it were out of joint; and yet by report they are passing good of deed, and labor most stoutly. Furthermore, it is generally held for certain, that the black or white in this kind are simply the worst for work, and condemned. Buls haue lesser and thinner horns than either Kine or Oxen. The best time to bring the Oxe or Bull to the yoke, and make him draw, is at 3 yeares of age; after, it is too late; and before, with the soonest. A yong Stere is soonest trained and taught to draw, if he be coupled in one yoke with another that hath bin wrought already, and beaten to his work: for this beast is our companion, and labors together with vs, in earing and plowing the ground: and so highly regarded was the Oxe in old time of our forefathers, that we find it registred vpon record, That a certain Roman was judicially endited, accused, and condemned by the people of Rome, for that (to satisfie the minde of a wanton minion) he had killed an Oxe, yea although he was his one; and for this fact was banished, as if he had slain his Grangier, or Bailif of his husbandry. Buls are known to be of a good kind & courageous, by their fierce and grim countenance, for they alwaies looke crabbed and frowning; their eares are ouergrown with stiffe haire, and their hornes so standing, as if they were euer disposed and ready to fight: but all his threatening and menaces appeare in his fore-feet; with them he giues warning, and as he is more and more angry, he bestirs himselfe now with the one foot, then with another, in course and by turnes, stamping and pawing with them against the ground, raising and flinging the dust about him aloft into the aire: and of all other beasts, hee alone after this maner inchafeth himselfe, and giues an edge vnto his anger. I my self haue seen them fight one with another for the maste: I haue seen them, being turned and swong round about in their sal, caught vp with the hornes of others, and yet rise againe & recouer themselves: I haue seene them lying along to be raised aloft from the ground; and when they haue run all amain with full pace, galloping in their chariots, yet staid and stood still when they should, as if the charioters had caused them to rest. The Theffalians were they who deuised with prauncing horse to ride gallop close to the Buls head to take them by the horne, wryth their neckes down, and so kill them. The first that exhibited this pleasant shew to the people at Rome was *Cesar* Dictator. The Bull yeeldeth the principal and most sumptuous sacrifice of all other vnto the gods, and therewith are they best pleased. This beast alone, of all that are long tailed, when it first comes into the world, hath not the taile of the full measure and perfect length as others, but it growes still, till it reach down to the very heels, and touch the ground. And hereupon it is, that in chusing calves for sacrifice, those are allowed for good and sufficient, whose taile reacheth to the joint of the haugh or gambrell: for if it be shorter, they will not be receiued & accepted of the gods. This also is noted by experience, that calves so little, that they be brought on mens shoulders to the altars to be killed, lightly are not sufficient to appease the gods. Neither are they pacified & well pleased with a beast that is lame or maimed, nor with that which is not appropriat vnto them, but to some other gods; ne yet with it that reules from the altar, and is loth to come to it. In the prodigies that we reade of ancient times, we find very oft, that Kine and Oxen haue spoken: vpon report of which strange token, the Senat was euer wont to assemble in some open place abroad, and not to sit either in hall or chamber.

CHAP. XLVI.

¶ Of the Bœufe or Oxe named *Apis*.

IN Egypt also they had an Oxe which the people of that country adored and worshipped as a god, vnder the name of *Apis*. This beaſt was marked in this manner; with a white ſpot on his right ſide, like to the horns or tips of the new moon croiſſant; a knot or bunch vnder the tongue, which they called *Cantharus*: by their religion it was not lawfull to ſuffer him to liue about a certain number of yeres, at the end of which term they drown him in a certain Wel or fountain of their prieſts, and ſo ſhorten his life: and then with great ſorrow fall to ſeek another to ſubſtitute in his place; vntill they find him they mourne and waile, and in token of grief and ſorrow, they ſhaue their heads. But long they neuer are before they meet with another, & when they haue him, he is by the prieſts brought to Memphis, where he hath 2 Temples, which they call *Thalami*, i. bed-chambers; out of which all the people of Egypt, as from an Oracle, are informed truly of things to come. For if this Oxe enter into the one of them it is a good luckie ſigne; but if he go into the other, then it portendeth great miſhap and infortunitie. And theſe be generall preſages to the whole nation. As for priuat perſons, he foretelleth them of things to come by the maner of taking meat at their hands, who come to know what fortune they ſhal haue. He turned away his head from the hand of *Germanicus Caſar*, and would eat no meat when he offered it him; but he died for it, and that not long after. He is kept ſecreſt and cloſe for the moſt part: but if at any time he get forth and come abroad to be ſeen of the multitude of people, he goeth with a gard of tip ſtaues to make way for him, and then a company of prety boies go chanting before him canticles and ſongs in his honour and praiſe: for it ſeemeth that he taketh heed to what they ſing, and is well pleaſed and contented thus to be worſhipped. Now theſe Chorifiers beforeſaid preſently fall into a kinde of furious rage, and withall are inſpired with the gift of prophesie, and ſo foretell what will enſue. Once a yere there is preſented vnto him a Cow, which hath marks likewiſe as he hath, but differing from his: and alwaies on what day this cow is found, the ſame day, by report, it dies. At Memphis there is a place within Nilus, which the inhabitants name *Phiola*, becauſe it is made in faſhion of a pot or boll; & therein duly euery yere the Egyptians drowne two cups, one of ſiluer, another of gold, during ſeuē daies, dedicated to ſolemnize the natiuitie of their god *Apis*. And this is one thing to be wondered at, that in that ſeuē-night ſpace there is not one that taketh hurt by Crocodiles: but let the eighth day come once, within ſix houres they returne to their former miſchieuous cruelty

CHAP. XLVII.

¶ The nature of Sheepe, and their breeding.

Sheepe likewiſe are in great requeſt, both in regard they ſerue as ſacrifices to pacifie the gods; and alſo by reaſon their fleece yeelds ſo profitable an uſe: for euen as men are beholden to the boeufe for their principall food and nourishment which they labour for, ſo they muſt acknowledge, that they haue their cloathing and couerture for their bodies from the poore ſheep. The ram and ewe both are fit for generation from two yeres of age vpwārd, vntill they come to nine, and ſome alſo vntill they be ten yeaes old. The lambes they yeaen firſt are but little ones. They go all generally to rut about the ſetting of *Arcturus*, viz. vpon the third day before the Ides of May; and their heat laſteth vnto the full of the *Ægle* ſtarre, namely the tenth day before the Calends of Auguſt. They be with yong 150 daies: if any take the Ram after that time, the fruit they beare comes to no good, but proues weake. And ſuch lambes as fall after that ſeaſon they called in old time *Cordos*, i. later lambes. Many men do preferre theſe winter lambes before thoſe that come in ſpring: the reaſon is, becauſe it is much better they ſhould be ſtrong before the heat of ſummer and the long daies, than againſt the cold of winter and the ſhortest daies: and they think that this creature only taketh good by being yeaened in the miſt of winter. It is kinde and naturall for Rams to make no account of young Hogrels, but to loath them: for they had rather follow after old ewes. Himſelfe alſo is better when he is old, and more luſty to leape the Ewes. To make him more milde and gentle they uſe to bore

A bore his horne about the root neere vnto his eares. If his right cullion or ſtone be tied vp, hee getteth ewe lambes; but if the left be taken vp, hee getteth ramme lambes. If ewes be alone by themſelues without the ſlocke when it thundreth, they caſt their lambes. The only remedie is to gather them together, that by company and fellowſhip they may haue help. They ſay, that if the North winds blow when they take the ram, they will bring forth males; but if the South winds be vp, females. Moreouer, great regard there is had in this kind, to the mouthes of the rams: for look what colour the veines be vnder their tongue, of the ſame will the fleece be of the lambes, that is to ſay, of ſundry colours, in caſe the veines were diuers coloured. Alſo the change of water and drinckes maketh them to alter their hew. In ſumme, two principall kinds there be of ſheep, that is to ſay, the one reared within houſe, and the other abroad in the field: the firſt is the tenderer, but the other more pleaſant meat and delicat in taſt; for thoſe within-houſe feed vpon briers and brambles. The clothes and couerings made of the Arabick wooll, are chiefe of all.

CHAP. XLVIII.

¶ Diuers kinds of wooll and clothes.

THe beſt wooll of all other, is that of *Apulia*: then, that which in Italy is named the Greek ſheepes wooll, but in other countries is named Italian. In the third ranke, the Mileſian ſheep and their wooll, carrie the prize. The wooll of *Apulia* is of a ſhort ſtaple, and ſpecially in requeſt for cloaks and mantles, and nothing elſe. About *Tarentum* and *Canuſium*, the richeſt of this kind are found: alſo at *Laodicea* in *Aſia*. As for whitenesse, there is none better than that which groweth along the *Po*, namely, about *Piemont* and *Lombardie*: and yet neuer to this day, a pound of it hath exceeded the price of an hundred ſeſterces. In all places they uſe not to ſheare ſheep: for the manner of plucking their ſells continueth ſtill in ſome countries. Sundry ſorts of colours there be in wooll, and ſo many, that we are not able to giue ſeueral names ſo much as to thoſe that we call *Natiue*, i. growing vpon the ſheeps backe. For black fleeces, *Spaine* is chiefe, *Pollentia* for white; and *G.ey*, the tract of *Piemont* neere to the *Alpes*: *Aſia* for red hath no fellow, and ſuch kind of wools are called *Erythraæ*. In *Bœtia* likewiſe, that is to ſay, in the kingdome of *Granade* and *Andaluſia*, the ſame colour is to be found. Neere to *Canuſia*, the ſheep be deepe yellow or tawnie: and about *Tarentum*, they are of a browne and duſkiſh colour. Generally, all kind of wools newly ſhorne or plucked, vnwaſht and greaſy ſtill, be good and medicinable. About *Iſtria* and *Liburnia*, the ſheeps fleece reſembleth haire rather than wooll, nothing at all good for to make frized clothes with a high nap: but ſerueth only for the Artizan or workman in *Portugall*, whoſe artificial weauing in net or ſcutcheon work with ſquares, commends this wooll. The like wooll is common about *Piſſenæ* in the prouince *Narbonenſis*, i. *Languedoc* in *Fraunce*: and ſuch is found in *Ægypt*: the cloth made thereof, after it is worne bare, is then died and ſerueth new againe, and will weare ſtill and laſt a mans life. The coarſe rough wooll with the round great haire, hath been of ancient time highly commended and accounted of in tapeſtrie worke: for euen *Homer* himſelfe witneſſeth, that they of the old world uſed the ſame much, and tooke great delight therein. But this tapeſtry is ſet out with colours in *Fraunce*, after one ſort, and among the *Parthians* after another. Moreouer, wooll of it ſelfe driuen together into a felt without ſpinning or weauing, ſerueth to make garments with: and if vinegre be uſed in the working of it, ſuch felts are of good proof to bear off the edge and point of the ſword, yea and more than that, they will check the force of the fire. And the laſt clenſing and reſuſe thereof (when it is taken out of the coppers and leads of thoſe that haue the ſulling and dreſſing thereof) ſerueth for flock-worke and to ſtuſſe matreſſes: an inuention (as I ſuppoſe) which came firſt out of *France*: for ſurely theſe flocks and quilted matreſſes, are at this day diſtinguiſhed and knowne one from another by French names. But I am not able eaſily to ſet downe at what time firſt this workmanſhip began: for certaine it is that in old time men made them pallets and beds of ſtraw, or elſe lay vpon bare mats, like as now adays ſouldiers in the camp make ſhift with hairy rugges. As for our mantles, frized deep both without and within, they were inuented & came to uſe firſt, no longer ſince than in my fathers daies: as alſo theſe hairy counterpoints and carpets. For the ſtudded caſſocks that Senatours and noble men of *Rome* do weare, begin but now for to be wouen after the manner of deep frieze rugges. Wooll that is blacke, will take no other hew, nor be dyed into any colour.

As

As touching the manner how to die other woolls, we wil speake in conuenient place, namely, **G** when we shall treat of the purples and sea shell fishes, and of certain hearbs good for that purpose. *M. Varro* writeth, That within the temple of *Sanguis*, there continued vnto the time that he wrote his booke, the wooll that ladie *Tanaquil*, otherwife named *Cata Cacia*, spun: together with her distaffe and spindle: as also, within the chappell of Fortune, the very roiall robe or mantle of Estate, made with her owne hands after the manner of water-chamlot in waue worke, which *Seruius Tullus* vsed to weare. And from hence came the fashion & custome at Rome, that when maidens were to be wedded, their attended vpon them a distaffe, drest and trimmed with kembd wooll, as also a spindle and yeare vpon it. The said *Tanaquil* was the first that made the coat or cassock wouen right out all thorough, such as new beginners (namely, young souldiers, barristers, & fresh brides) put on vnder their white plaine gownes, without any guard of purple. **H** The waued water Chamelot, was from the beginning esteemed the richest and brauest wearing. And from thence came the branched damaske in broad workes. *Fenestella* writeth, That in the latter time of *Augustus Caesar* they began at Rome to vse their gownes of cloth shorne, as also with a curled nap. As for those robes which are called Crebrae and Papaueratae, wrought thick with floure-worke, resembling poppies, or pressed euen and smooth; they be of greater antiquitie: for euen in the time of *Lucilius* the Poet, *Torquatus* was noted and reprooued for wearing them. The long robes embroidered before, called *Prætextæ*, were deuised first by the *Tuscanes*. The *Trabæ* were roiall robes, and I find that kings & princes only ware them. In *Homers* time also they vsed garments embroidered with imagerie and floureworkes: & from thence came the triumphant robes. As for embroidery it selfe and needle-work, it was the *Phrygians* inuention: **I** and hereupon embroiders be called in Latine *Phrygiones*. And in the same Asia, king *Attalus* was the first that deuised cloth of gold: and thence come such clothes to be called *Attalica*. In Babylon they vsed much to weaue their cloth of diuers colours, and this was a great wearing among them, & clothes so wrought were called *Babylonica*. To weaue cloth of tiffue with twisted threads both in woofe and warp, and the same of sundry colours, was the inuention of *Alexandria*, and such clothes and garments were named *Polymita*. But France deuised the scutchion, square, or lozenge damask-work. *Metellus Scipio*, among other challenges and imputations laid against *Capito*, reproched and accused him for this, That his hanging s and furniture of his dining chamber, being Babylonian worke or cloth of Arras, were sold for 800000 sesterces: and such like of late daies stood prince *Nero* in 400 hundred thousand sesterces, i. 40 millions. **K** The embroidered long robes of *Seruius Tullus*, wherewith he couered and arraied all ouer the Image of Fortune, by him dedicated, remained whole and found vnto the end of *Seianus*. And a wonder it was, that they neither fell from the image, nor were moth-eaten in 560 yeares. I haue my selfe seen the sheeps fleeces vpon their backs while they be aliue, died with purple, with scarlet in grain, and the violet liquor of the fish *Murex*: by the means of certaine barks of a foot and a halfe long dipped in these colors, and so imprinted and set vpon their fleeces: as if riotous wantonnes and superfluitie should force Natures work, and make wooll to grow of that colour. As for the sheep it selfe, she is knowne to be kindly enough by these marks, If she be short legged, and wel woollled vnder the bellie, for such as were naked there and pilled, they condemned and held for naught, and those they called *Apicæ*. In Syria, sheep haue tailes a cubit long, and they beare most wooll there. To lib lambs before they be fve moneths old, it is thought to be with the soonest, and daungerous. **L**

CHAP. XLIX.

¶ Of a beast called *Musmon*.

T Here is in Spaine, but especially in the Isle Corfica, a kind of *Musmones*, not altogether vnlike to sheep, hauing a shag more like the haire of goats, than a fleece with sheeps wooll. That kind which is engendred between them and sheepe, they called in old time *Vmbri*. This beast hath a most tender head, and therefore in his pasture he is forced to feed with his taile to the sunne. Of all liuing creatures, those that bare wooll are most foolish: for take but one of them by the horne and lead him any whither, all the rest will follow, though otherwise they were afraid to go that way. The longest that they liue in those parts, is 9 yeares; howsoeuer in *Æthiopia* they come to 13. In which country, goats also liue 11 yeares, whereas in other

other countries of the world, for the most part, they passe not eight. And both sorts, as well the one as the other, be sped within foure leapings.

CHAP. L.

¶ Of Goats, and their breeding.

G Oats bring forth foure kids otherwhiles, but that is very seldome. They goe with young fve months as ewes do. Shee goats waxe barren with fatnesse. When they be come once to be three yeares old, they are not so good to breed: ne yet when they be elder, and namely, being past foure yeares of age. They begin at the seuenth month, euen whiles they sucke their dammes. And as well the bucke as the Doe are held the better for breed, if they be nott, and haue no hornes. The first time that the shee goats are leaped, they stand not to it: the second leaping speedeth better, and so forward. They chuse willingly to take the buck in the month of Nouember, that they might bring kids in March following, when all shrubs put forth and begin to sprout and bud, for them to brouze. And this is sometime when they be a yeare old, but they neuer faile at two yeares: yea and when they be full three, they are not vtterly decayed and done, but are good still: for they beare 8 yeares. Subject they be in cold weather, to cast their young and yeane vntimely. The Doe, when she perceiueh her eies dimme and ouer-cast either with pin and web or catarract, pricketh them with the sharp point of some bulrush, and so leeteth them blood: but the bucke goeth to the brier and doth the like. *Mutianus* reporteth, that he had occasion vpon a time to mark the wit of this creature: It happened, that vpon a narrow thinne plank that lay for a bridge, that one goat met another coming both from diuers parts: now by reason that the place was so narrow that they could not passe by nor turne about, ne yet retire backwards blindly, considering how long the plank was & so slender withall; moreover, the water that ran vnderneath ran with a swift streame, and threatned present death if they failed and went besides: *Mutianus* (I say) affirmeth, that he saw one of them to lie flat down, and the other to goe ouer his backe. As for the male goats, they are held for the best which are most camoise or snout nosed, haue long eares, and the same slit in, with great store of shag haire about their shoulders. But the mark to know the kindest female is this, they haue two lappets, locks, or plaits as it were of haire, hanging downe along their bodie on either side from their neck. They haue not al of them hornes, but some are nott; but in those which are horned, a man may know their age by the number of the knots therein more or lesse: and in very truth the nott shee goats are more free of milke. *Archelaus* writeth, that they take their breath at the eares, and not at the nostrils: also that they be neuer cleare of the ague. And this haply is the cause, that they are hotter mouthed, and haue a stronger breath than sheepe, and more egre in their rut. Men say moreover, that they see by night as well as by day: therefore they that when euening is come see nothing at all, recover their perfect sight again by eating ordinarily the liuer of goats. In Cilicia and about the Syrtis, the people clad themselues with goats haire, for there they shere them as sheep. Furthermore it is said, that goats toward the Sun-setting, cannot in their pasture see directly one another, but by turning taile to taile: as for other houres of the day, they keep head to head, & range together with the rest of their fellows. They haue all of them a tuft of haire like a beard hanging vnder their chin, which they call *Aruncus*. If a man take one of them by this beard and draw it forth of the stock, all the rest will stand still gazing thereat, as if they were astoned, and so wil they doe if any of them chance to bite of a certaine hearb. Their teeth kill trees. As for an oliue tree, if they doe but lick it, they spoile it for euer bearing after: and for this cause they be not killed in sacrifice to *Minerva*.

CHAP. LI.

¶ Of Swine, and their natures.

S Wine goe a brimming from the time that the Westerne wind *Fauonius* beginnes to blow, vntill the spring *Æquinoctiall*: and they take the bore when they be eight months old: yea in some places at the fourth month of their age, and continue breeding vnto the seuenth yeare. They farrow commonly twice a yeare: they be with pig foure months. One sow may bring at one farrow twenty pigges, but reare so many she cannot. *Nigidius* saith, that those pigs which

which are farrowed ten daies vnder or ten daies ouer the shortest day in the yeare, when the sun entrencheth into Capricorn, haue teeth immediatly. They stand lightly to the first brimming, but by reason that they are subiect to cast their pigs, they had need to be brimmed a second time. Howbeit the best way to preuent that they doe not slip their young, is to keepe the bore from them at their first grunting and seeking after him, nor to let them be brimmed before their ears hang downe. Bores be not good to brim swine after they be three yeres old. Sows when they be wearie for age that they cannot stand, take the bore lying along. That a sow should eat her own pigs, it is no prodigious wonder. A pig is pure & good for sacrifice, 5 daies after it is farrowed; a lamb, when it hath been yeaned 8 daies; and a calfe, being 30 daies old. But *Gornucanus* saith, That all beasts for sacrifice which chew cud, are not pure and right for that purpose, vntill they haue teeth. Swine hauing lost one eie, are not thought to liue long after; otherwise they may continue vntill they be fifteen yeres old, yea & some to twenty. But they grow to be wood and raging otherwhiles: and besides are subiect to many maladies more, & most of all to the squinancie, and wen or swelling of the kernels in the neck. Will ye know when a swine is sick or vnfound, pluck a bristle from the back and it will be bloudie at the root: also he will cary his neck at one side, as he goeth. A sow, if she be ouer-fat, soone wanteth milke; and at her first farrow bringeth fewest pigs. All the kind of them loue to wallow in dirt and mire. They wrinkle their tails, wherein this also is obserued, that they be more likely to appease the gods in sacrifice, that rather writh & turn their tails to the right hand, than the left. Swine wil be fat and wel larded in sixtie daies; and the rather, if before you begin to frantk them vp, they be kept altogether from meat three daies. Of all other beasts, they are most brutish; inso much as there goes a pleasant by-word of them, and fitteth them well, *That their life is giuen them in stead of salt*. This is known for a truth, that when certaine theeues had stolne and driuen away a companie of them, the swinheard hauing followed them to the water side (for by that time were the theeues imbarged with them) cried aloud vnto the swine, as his manner was: whereupon they knowing his voice, learned all to one side of the vessel, turned it ouer and sunke it, tooke the water, and so swam againe to land vnto their keeper. Moreover, the hogs that vse to lead and goe before the heard, are so well trained, that they wil of themselves goe to the swine-market place within the citie, & from thence home againe to their maisters, without any guid to direct them. The wild bores in this kind, haue the wit to couer their tracks with mire, and for the nones to run ouer marish ground where the prints of their footing will not be sene; yea and to be more light in running, to void their vrine first. Sows also are plaied as well as camels, but two daies before, they be kept from meat: then hang they by the fore-legs, for to make incision into their matrice, and to take forth their stones: and by this means they will sooner grow to be fat. There is an Art also in cookerie, to make the liuer of a sow, as also of a goose, more daintie (and it was the devise of *M. Apicius*) namely, to feed them with drie figges, and when they haue eaten till they bee full, presently to giue them mead or honied wine to drink, vntill they die with being ouercharged. There is not the flesh of any other liuing creature, that yeeldeth more store of dishes to the maintenance of gluttonie, than this; for fittie sundrie sorts of tastes it affordeth, whereas other haue but one a peece. From hence came so many edicts and proclamations published by the Censors, forbidding and prohibiting to serue vp at any feast or supper, the belly and paps of a sow, the kernels about the neck, the brizen, the stones, the womb, and the fore-part of the bores head: and yet for all that, *Publius* the Poet and maker of wanton songs, after that he was come to his freedom, neuer (by report) had supper without an hogs belly with the paps: who also to that dish gaue the name, and called it *Sumen*. Moreover, the flesh of wild bores came to be in great request and was much set by: in such sort, as *Cato* the Censor in his inuictiue orations, challenged men for brawne. And yet when they made three kinds of meat of the wild bore, the loine was alwaies serued vp in the mids. The first Romane that brought to the table a whole bore at once was *P. Sernilius Rullus*, father of that *Rullus*, who in the time that *Cicero* was Consul, published the law *Agraria*, as touching the diuision of lands. See how little while ago it is since these superfluities began, which now are taken vp so ordinarily euerie day. And yet the thing was noted and recorded in the Annals, as strange and rare; no doubt for this intent, To repress these inordinate enormities. One supper then or feast was taxed and reprooued therein at the beginning: but now, two and three bores at a time are serued vp whole and eaten together.

CHAP.

CHAP. LII.

¶ Of Parks for wild beasts.

The first man of the long robe that deuised parks as well for these bores, as for other deere and sauage beasts, was *Fulvius Lippinus*, who in the territorie of *Tarquinius* began to keepe and feed wild beasts for his game. And long it was not but others followed his steps, to wit, *L. Lucullus* and *Q. Hortensius*. Sows of the wild kind bring forth pigs but once a yere; and the bores in briming time are exceeding fierce and fel: then they fight one with another, they harden their sides, rubbing them against the bodies of trees, and all to wallow themselves in the mire, coating their backs with dirt. But they are not so raging then, but the sows in their farrowing are much worse, and lightly it is so in all other kind of beasts. Wild bores are not fit for generation before they be a yere old. The wild bores of India haue two bowing fangs or tusks of a cubit length, growing out of their mouth, and as many out of their foreheads like to calues horns. The bristly haire of the wild sort is like to brasse: but of others black. In Arabia swine will not liue.

CHAP. LIII.

¶ Of Beasts halfe sauage.

There is no creature ingenders so soon with wild of the kind, as doth swine: & verily such hogs in old time they called Hybrides, as a man would say, halfe wild; inso much as this terme by a translation hath bin attributed to mankind. For so was *C. Antonius*, colleague with *Cicero* in the Consulship, nicknamed. And not in swine onely, but also in all other liuing creatures, looke where there be any tame and domestical, you may find also wild and sauage of the same kind: seeing that euen of wild men there be also many sorts in diuers places, as wee haue before said. As for the goats kind, how many & how sundry resemblances are to be found in them of other beasts: for among them you shall haue the roebucke, the shamois, the wilde goat called the Eueck, wonderfull swift, albeir his head be loden with huge hornes like sword scabberds: by these they hang and poise themselves from rockes, namely, when they minde to leap from one to another, for by swinging to and fro they skip and jump the more nimbly, and fetch a jerk out to what place they list, as it were forth of an engin. Of this kind be the *Origes*, the only beasts, as some thinke, of all others, that are said to haue their haire growing contrariwise and turning toward the head. To these belong the Does, and a kinde of fallow Deere called *Pygargi*, as also those that are named *Strepsicerotes*, and many other not far vnlike. As for the former sort they come out of the Alps. These last rehearsed are sent from other parts beyond-sea.

CHAP. LIV.

¶ Of Apes and Monkeys.

All the kinde of these Apes approach neere of all beasts to the resemblance of a mans shape: but they differ one from another in the taile. Marvellous crafty and subtilly they be to beguile themselves: for by report, as they see hunters doe before them, they will imitate them in euery point, euen to besmeare themselves with glew & birdlime, & shoo their feet within grins and snares, and by that means are caught. *Mutianus* saith, that he hath seene Apes play at chesse and table: and that at first sight they could know nuts made of waxe from others. He affirmes also, that when the moon is in the wain, the monkeys & Marmosets (which in this kinde haue tails) are sad and heauy, but the new moone they adore and ioy at, which they testifie by hopping and dancing. As for the eclipse of Sun or Moone, all other foure footed beasts also do greatly dread and feare. The she Apes of all sorts are wondrous fond of their little ones: and such as are made tame within house will carry them in their armes all about so soone as they haue brought them into the world, keepe a shewing of them to euery bodie, and they take pleasure to haue them dandled by others, as if thereby they tooke knowledge that folke ioyed for their safe deliuerance: but such a culling and hugging of them they keep, that

in the end with very claspings and clipping they kill them many times. Apes that be headed and long snouted like dogs, and thereof called Cynocephali, are of all other most curst, shrewd and unhappy: like as the Marmozets and Monkeys called Sphinges & Satyri, are gentlest and most familiar: as for those called Callitriches, they be clean of another form & shape all over in a manner; they have a beard on their visage, & the forepart of their taile spreadeth broad. But this creature is said to live in no other climat but Ethiopia, where it breedeth.

CHAP. LV.

¶ Of Hares and Connies.

OF Hares also there be many sorts: vpon the Alps & such high mountains they be white of colour so long as the snow lieth; and it is verily thought, that all Winter long they live with eating of snow: for surely when it is thawed and melted, all the yere after they be brown and reddish as before: and a creature it is otherwise bred in extreme and intolerable cold. Of the Hares kind are they also which in Spain they call Connies, which are exceeding fruitfull, and of wonderfull increase: in so much, as having deuoured all the corn in the field before harvest, in the Baleare Islands, they brought thereby a famine vpon the people. There is a most daintie dish serued vp at the table, made of Leuerets or rabbits, either cut out of the dams bellies, or taken from them when they are suckers, without clensing them at all of the garbage, and such the Latines call Laurices. It is know for certain, that the Islanders of Majorca & Minorca made means to the Emperor Augustus Caesar, for a power of soldiers to destroy the infinit increase of Connies among them. Ferrets are in great account for chasing and hunting these Connies: the manner is to put them into their earths, which within the ground haue many waies and holes like mines, and thereupon these creatures are called *Cuniculi*: and when they are within, they so course the poore Connies out of their earth, that they are soon taken about ground at the mouth of their holes. *Archelanus* writes, that looke how many receptacles & waies of passage the Hare hath for his dung and excrements, so many yeares old he is iust. And verily some haue more than others. The same writer is of opinion, that euery hare is both male and female, and that any of them can breed without the bucke. Certes herein Nature hath shewed her bounty and goodnesse, in that she hath giuen this creature (so good to eat, and so harmlesse otherwise) the gift of fertilitie and fruitfull wombe. The Hare, naturally exposed to be a prey and game for all men, is the only creature, vnles it be the Connie again called *Dasipus*, which after it be once with yong, conceiue again vpon it: in so much as at one time shee hath some Leuerets sucking of her, others in her belly; and those not of the same forwardnesse, for some of them are covered with haire, others are naked without any downe; and there be againe of them that as yet are not shapen at all, but without all forme. Moreouer, men haue assaied to make cloath of Hares and Connies haire: but in the hand they are not so soft as is the fur vpon the skin or case: neither will they last, by reason that the haire is short and will soon shed.

CHAP. LVI.

¶ Of Beasts halfe tame.

AS for Hares, seldome be they made tame and to come to hand; and yet iustly they cannot be simply called wild: for many other such creatures there be besides, that neither are language, nor tame and gentle, but of a middle nature betwixt both: as namely among flying fowles in the aire, the Swallow: likewise the Bee: and among fishes the Dolphin in the sea.

CHAP. LVII.

¶ Of Mice and Rats, Dormice, Reer-mice, and Bats.

IN the rank of those that be neither tame nor wild, many haue ranged the Mice and rats that haunt our houses. A creature this is of no smal reckoning for presaging somewhat to a state, by some strange and prodigious tokens. By gnawing the siluer shields & bucklers at Lavinium, they portended and foreshewed the Marrian war. Vnto *Carbo* the L. Generall, by eating of his hose garters and shooe-strings at Clusium they prognosticated his death. Many forts

A there be of them in the country of Cyrene, some with a broad flat forehead, others with a sharp pointed: and there be of them seen to haue sharp prickles like to vetchins or hedge-hogs. *Theophrastus* reporteth, that these vermin hauing dispeopled the Isle Gyaros, and driuen away the inhabitants, gnawed and deuoured euery thing they could meet withal, euen to their very iron. And surely it seemes that is their nature so to doe: for euen amongst the Chalybes they serue them so, in eating their iron and Steele within their very forges: yea, & in gold mines they play the like part: & therefore being caught, their bellies be ript by the pioners in the mine, where they euermore find their stolen gold again. See what delight this creature takes in theeuing. We read in the Chronicles, that whiles *Annibal* lay in sieg before the towne Casilinum, a rat was sold within the town for 200 Sesterces: the man who bought it at that price liued; but the party who sold it through greedines of money died for hunger. By the learning of Soothsayers obserued it is, that if there be store of white ones bred, it is a good signe and presageth prosperitie. And in truth our stories are full of the like examples, and namely, that if rats be heard to cry or squeak in the time of ceremoniall taking the Auspices and signes of birds, all is marred; and that businesse clean dasht. *Nigidius* saith, that rats lie close hidden all winter, like as Dormice. By the Edicts of the Censors, and principally by an Act of *M. Scaurus* in his Consulship, provided it was, & streight order taken, that no Rats, Mice, or Dormice should be serued vp to the table at their great suppers and feasts: like as all shell fish or fowle set out of foreign countries far remote. Counted are Dormice betwene tame and wilde: and verily he that first deuised to keepe wilde bores in parkes, found means also to nourish and feed these creatures in great tuns, pipes, and drifats. In the experiment and triall whereof this hath bin found & obserued, That willingly these little creatures will not sort together vnlesse they were countrymen as it were, and bred in one & the same Forrest: and if it chance that there be intermingled among them any strangers, to wit, such as had either some riuer or mountain between the places where they were bred, they kil one another with fighting. The yong Dormice are exceeding kind and louing to their fires that begat them; for when they be old and feeble, full tenderly will they feed and nourish them. They renew their age euery yere by sleeping all winter; for they lie by it close snug all the while, and are not to be seen: but come the sommer once they be yong and fresh againe. And thus the field mice likewise take their rest, and do the same.

CHAP. LVIII.

¶ What Creatures live not but in certaine places.

A Wonderfull thing it is to see, that Nature hath not only brought forth diuers creatures in sundrie Countries, but also in one region vnder the same climate hath denied some of them to live in euery corner thereof. And namely in the Forrest of Moesia in Italie, these Dormice are found but only in one part thereof. And in Lycia, the wild goats, roe-bucks, and Does neuer passe the mountaines that confine vpon the Syrians: no more than the wilde Asses transmount that hill which diuides Cappadocia from Cilicia. Within Hellepont the Stags and Hinds neuer go forth and enter into the marches of other countries: and those about *Arginussa* passe not the mountaine *Elatos*: which may be knowne by this, that all vpon that hill haue their eares marked and slit. In the Island *Poroselenum* the weezels will not crosse ouer the highway. And about *Lebadia* in *Boeotia*, those moldwarps or warts that are brought thither from other parts, will not abide the very soile, but flie from it; which neere-by in *Orthomenus*, vndermine and hollow all their corn fields: and such store there is of them, that I haue seen all the hangings, carpets, counterpoints, and couerlets of chambers made of their skinned. See how men for no religion and feare of the gods will be kept from taking their pleasures and making their delights of these creatures, otherwise prodigious & portending things to come. The strange Hares that be brought into Ithaca will not liue there, but seeking to escape, are found dead vpon the very banks of the sea side. In the Island *Eubusis* be no Connies at all: and yet in Spain and the Baleare Isles there are so many, that they pester the whole country. Frogs were euer in Cyrene naturally mute, and would not cry: but brought there were thither out of the continent such as would cry in the water: and that whole kind still remaineth vocal. In the Island *Scriphos* you shall not yet heare a Frogge to cry: let the same be carried forth to other

other places, they will keep a singing as well as the rest: And (by report) the like hapned in a lake of Theffaly named Sicendus. In Italy the hardy shrews are venomous in their biting: but passe over the Apennine once there are no more such to be found. In what country soeuer they be, let them go ouer the tract of a cart wheele they die presently. In Olympus a mountaine of Macedony there are nowolues, ne yet in the Isle of Candy: and there verily are to be found no Foxes nor Beares, and in one word, no hurtfull or noisome beast, vnlesse it be a kinde of spider called *Phalangium*, whereof we will speake more in due time and place. And that which is more wonderfull, in the same Isle there are no stags or hinds, saue only in the region and quarter of the Cydoniates: no wild bores likewise, nor the fowle called the Godwit or Attagene, ne yet Vrchins. To conclude, in Africk ye shall find no wild bores, no Stags and Hinds, no roe-bucks and Does, ne yet Beares.

CHAP. LIX.

¶ *What Creatures are hurtfull to strangers.*

Now, some liuing creatures there be that do no harm at all to the inhabitants of the same countries, but kill all strangers. Namely, certain serpents in Tirinthe, which are supposed to breed of themselves out of the very earth. Semblably, in Syria there be snakes, and specially along the banks of Euphrates, that will not touch the Sirians lying along asleep: nay, if a man that leans vpon them be stung or bitten by them, he shall find no hurt or mischief thereby. But to men of all other nations whatsoeuer they are most spitefully bent, them they will with great greedinesse eagerly assaile and fly vpon, yea, and kill them with extreme paine and anguish: and therefore it is that the Sirians destroy them not. Contrariwise *Aristotle* reporteth, That in Latmos (a mountain in Caria) the Scorpions will do no harm to strangers, marie the inhabitants of the same country they will sting to death. Now let vs proceed to other liuing creatures besides those of the land, and discourse of their sundry sorts and kinds.

THE NINTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

CHAP. I.

¶ *The nature of water Creatures.*

Haue thus shewed the nature of those beasts that liue vpon the land, and therein haue some societie & fellow ship with men. And considering, that of all others besides in the world, they that flie be the least, we will first treat of those fish that keep in the sea, not forgetting those also either in running fresh riuers or standing lakes.

CHAP. II.

¶ *What the reason is why the sea should breed the greatest liuing creatures.*

The waters bring forth more store of liuing creatures, and the same greater than the land. The cause whereof is euiden, euen the excessiue abundance of moisture. As for the fowls & birds, who liue hanging, as it were, & hovering in the aire, their case is otherwise. Now

A in the sea, being so wide, so large and open, readie to receive from heauen about the genitall seeds and causes of generation, being so soft and pliable, so proper & fit to yeeld nourishment and encrease; assisted also by Nature, which is neuer idle, but alwaies framing one new creature or other: no maruell it is if there are found so many strange and monstrous things as there be. For the seeds and vniuersall elements of the world are so interlaced sundry waies, and mingled one within another, partly by the blowing of the winds; and partly with the rolling and agitation of the waues, insomuch as it may truly be said, according to the vulgar opinion, that whatsoeuer is engendred and bred in any part of the world besides, is to be found in the sea: and many more things in it, which nowhere else are to be seen. For there shall ye meet with fishes, resembling not onely the forme and shape of land creatures liuing, but also the figure and fashion of many things without life: there may one see bunches of grapes, swords, and sawes, represented; yea, and also cucumbers, which for colour, smell, and taste, resembleth those growing vpon the earth. And therefore we need the lesse to wonder, if in so little shell fishes as are cockles, there be somewhat standing out like horse-heads.

CHAP. III.

¶ *Of the monstrous fishes in the Indian sea.*

The Indian sea breedeth the most and biggest fishes that are: among which, the Whales and Whirlepools called *Balæna*, take vp in length as much as foure acres or arpens of land: likewise the *Pristes* are two hundred cubits long: and no maruell, since *Locusts* are there to be found of foure cubits in length: and yeeles within the riuer *Ganges* of thirtie foot in length. But these monstrous fishes in the sea, are most to be seen about the midst of Summer, & when the daies be at the longest with vs. For then by the means of whirle winds, storms, winds, and blustering tempests which come with violence down from the mountains and promontories, the seas are troubled from the very bottome, and turned vpside downe: whereupon the surging billowes thereof, raise these monsters out of the deep, and roll them vp to be seen. For in that manner so great a multitude of *Tunnies* were discovered and arose, that the whole armada of king *Alexander* the great, seeing them comming like to an armie of enemies in order of battell, was driuen to range & make head against them, close vnited together: for otherwise, if they had failed scattering asunder, there had bin no way to escape, but ouerturned they had bin, with such a force and sway came these *Tunnies* in a skull vpon them. And verily, no voice, crie, hollaing and houting, no nor any blowes and raps affrighted this kind of fish, only at some cracke or crashing noise they be terrified: and neuer are they troubled and disquieted so much as when they perceiue some huge thing ready to fall vpon them.

In the red sea there lies a great demie Island named *Cadara*, so farre out into the sea, that it maketh a huge gulf vnder the wind, which king *Prolemeus* was 12 daies and 12 nights a rowing through: forasmuch as there is no wind at all vses to blow there. In this creeke so close and quiet, there be fish and Whales grow to that bignes, that for their very weight and vnweldines of their bodie, they are not able to stirre. The Admirals and other capitaines of the fleet of the foresaid *Alexander* the great, made report, That the *Gedrosi*, a people dwelling vpon the riuer *Arbis*, vse to make of such fishes chawes, the dores of their houses; also that they lay their bones ouerthwart from one side of the house to another, in stead of beames, joists and rafters to beare vp their floores and rouses: and that some of them were found to be fortie cubits long.

In those parts there be found in the sea certaine strange beasts like sheep, which goe forth to land, feed vpon the roots of plants and herbes, and then returne againe into the sea. Others also which are headed like Horses, Asies, and Bulls: and those many times eat downe the standing corne vpon the ground.

CHAP. IIII.

¶ *Which be the greatest fishes in any coast of the Ocean sea.*

The biggest and most monstrous creature in the Indish Ocean, are the whales called *Pristis* & *Balæna*. In the French Ocean there is discovered a mighty fish called *Physeter*, [i.e. Whirlepole] rising vp aloft out of the sea in manner of a columnne or pillar, higher than the

the very failles of the ships: and then he spouteth and casteth forth a mightie deale of water, as it were out of a conduit, enough to drowne and sinke a ship. In the Ocean of Gades, betweene Portugale and Andalusia, there is a monstrous fish to be seen like a mightie great tree, spreading abroad with so mightie armes, that in regard thereof onely, it is thought verily it neuer entered into the streights or narrow sea there by of Gibraltar. There shew themselves otherwhiles fishes made like two great wheelles, and thereupon they be called: framed distinctly with foure armes, representing as many spokes: and with their eies they seem to couer close the naues from one side to the other, wherein the said spokes are fastened.

CHAP. V.

¶ Of Tritons, Nereides, and sea-Elephants, and their formes.

IN the time that *Tiberius* was Emperour, there came vnto him an Embassador from *Flisipon*, sent of purpose to make relation, That vpon their sea-coast there was discovered within a certain hole, a certain sea goblin, called *Triton*, founding a shell like a trumpet or cornet: and that he was in forme and shap like those that are commonly painted for Tritons. And as for the Meremaids called *Nereides*, it is no fabulous tale that goes of them: for look how painters draw them, so they are indeed: onely their bodie is tough & skaled all ouer, euen in those parts wherein they resemble a woman. For such a Mermaid was seen and beheld plainly vpon the same coast neere to the shore: and the inhabitants dwelling neere, heard it a far off when it was a dying, to make pitteous mone, crying & chattering very heauily. Moreouer, a lieutenant or gouernor vnder *Augustus Caesar* in Gaule, aduertised him by his letters, That many of these *Nereides* or Mearmaids were seen cast vpon the sands, and lying dead. I am able to bring forth for mine authors diuers knights of Rome, right worshipfull persons and of good credit, who testifie, that in the coast of the Spanish Ocean neer vnto Gades, they haue seen a Mere-man, in euery respect resembling a man as perfectly in all parts of the bodie as might be. And they report moreouer, that in the night season he would come out of the sea aboard their ships: but look vpon what part fouer he settled, he waied the same downe, & if he rested and continued there any long time, he would sinke it cleane. In the daies of *Tiberius* the Emperour, in a certain Island vpon the coast of the prouince of Lions, the sea after an ebbe left vpon the bare sands 300 sea-monsters and aboue, at one fote together, of a wonderfull varietie and bignesse, differing asunder. And there were no fewer found vpon the coast of the Santones. And among the rest there were sea-Elephants and rams, with teeth standing out, & hornes also, like to those of the land, but that they were white like as the fore-said teeth: ouer & besides, many Meremaids. *Turanus* hath reported, That a monster was driuen and cast vpon the coast of Gades, betweene the two hindmost fins whereof in the taile, were 16 cubits: it had 122 teeth, whereof the biggest were a span or nine inches in measure, and the least halfe a foot. *M. Scaurus* among other strange and wonderfull sights that he exhibited to the people of Rome, to doe them peasure in his Edifice-ship, shewed openly the bones of that sea-monster, before which ladie *Andromeda* (by report) was cast to be deuoured: which were brought to Rome from Ioppe, a towne in Iudæa: and they caried in length fortie foot: deeper were the ribs than any Indian Elephant is high, and the ridge-bone a foot and halfe thicke.

CHAP. VI.

¶ Of the Balænes and Orca.

THESE monstrous Whales named Balæne, otherwhiles come into our seas also. They say that in the coast of the Spanish Ocean by Gades, they are not seen before midwinter when the daies be shortest: for at their set times they lie close in a certain calme deep and large creeke, which they chuse to cast their spawn in, and their delight aboue all places to breed. The Orca, other monstrous fishes, know this full well, and deadly enemies they be vnto the foresaid whales. And verily, if I should pourtrait them, I can resemble them to nothing else but a mightie masse and lump of flesh without all fashion, armed with most terrible, sharpe, and cutting teeth. Well, these being ware that the Whales are there, breake into this secret by-creek out of the way, seeke them out, and if they meet either with the youug ones, or the dammes that haue newly

- A newly spawn'd, or yet great with spawn, they all to cut & hack them with their trenchant teeth: yea, they run against them as it were a foist or ship, of warre armed with sharp brazen pikes in the beake-head. But contrariwise, the Balænes or Whales aforesaid, that cannot wind and turne aside for defence, and much lesse make head and resist, so vnweldie as they bee by reason of their owne weightie and heauie bodie, (and as then either big bellied, or else weakened lately with the paines of trauell and caluing their young ones) haue no other meanes of helpe and succor but to shoot into the deepe, and gaine sea-rome to defend themselves from the enemy. On the other side, the Orca labour (to cut them short of their purpose) to lie betweene them and home in their very way, and otherwhiles kill them vnawares in the streights, or drieue them vpon the shelues and shallows, or else force them against the very rocks, & so bruite them;
- B When these combats and fights are seen, the sea seemes as if it were angry with it selfe: for albeit no winds are vp, but all calme in that creek and gulfe, yet ye shall haue waues in that place where they encounter (with the blafts of their breath, and the blowes giuen by the assailant) so great, as no tempestuous whirle windes whatsoeuer are able to raise. In the haue of Ostia likewise there was discovered one of these Orcas, and the same assailed by *Claudius* the Emperour. It chanced to come as he was making the said harbour or pere, drawne and trained thither with the sweetnes of certaine beasts hides that were brought out of Gaule, and were cast away and perished by the way. Of them for certaine daies she had fed, and still following them, with the weight of her heauie bodie had made a furrow and channel (as it were) with her bellie in the bottome among the shelues: and by reason of the flowing of the sea she was so inuested and compassed in with the sands, that by no means possible she could turn about: but stil while
- C she goes after these hides whereof she fed, she was by the billows of the sea cast afloate on the shore, so as her back was to be seene a great deale aboue the water, much like to the bottome or keele of a ship turned vpside downe. Then the Emperour comanded to draw great nets and cords with many folds along the mouth of the haue on euery side behind the fish, himselfe accompanied with certaine Pretorian cohorts, for to shew a pleasant sight vnto the people of Rome, came against this monstrous fish, and out of many hoies and barks the souldiers launced darts and jaelines thicke. And one of them I saw my selfe sunke downe right with the abundance of water that this monstrous fish spouted and filled it withall. The Whales called Balæne haue a certaine mouth or great hole in their forehead, and therefore as they swim afloate on the water, they send vp on high (as it were) with a mighty strong breath a great quantity of water when they list, like stormes of raine.

CHAP. VII.

¶ Whether fish do breath and sleepe, or no.

- ALL writers are fully resolu'd in this, That the Whales aforesaid, as well the Balæne as the Orca, and some few other fishes bred & nourished in the sea, which among other inward bowels haue lights, doe breath. For otherwise it were not possible, that either they or any other beast, without lights or lungs should blow: and they that be of this opinion, suppose likewise, that no fishes hauing gills, do draw in and deliuer their wind again to and from: nor many other kinds besides, although they want the foresaid gills. Among others, I see that *Aristotle* was of that mind, and by many profound and learned reasons perswaded & induced many more to hold the same. For mine owne part, if I should speake frankly what I think, I professe that I am not of their judgment. For why? Nature if she be so disposed, may giue in steed of light some other organs and instruments of breath: to this creature one, to that another: like as many other creatures haue another kind of moist humor in lieu of blood. And who would maruel, that this vitall spirit should pierce within the waters, considering that he seeth evidently how it riseth againe and is deliuered from thence: also how the aire entreth euen into the earth, which is the grossest & hardest of all the elements: As we may perceiue by this good argument, that some creatures, which albeit they be alwaies couered within the ground, yet liue and breath neuertheless, and namely, the Wants or Mold-warpes. Moreouer, I haue diuers pregnant & effectual reasons inducing me to beleue, that all water creatures breathe each one after their maner, as Nature hath ordained. First and principally, I haue obserued oftentimes by experience, That fishes evidently breath and pant for wind (after a sort) in the great heat of Summer: as also that they

they yawne and gape when the weather is calme & the sea still. And they themselves also who hold the contrary, confesse plainly, that fishes doe sleepe. And if that be true, How, I pray you, can they sleep if they take not their wind? Moreouer, whence come those bubbles which continually are breathed forth from vnder the water? and what shall we say to those shell fishes which wax and decay in substance of bodie, according to the effect of the Moones encrease or decrease? But about all, fishes haue hearing and smelling, and no doubt both these senses are performed and maintained by the benefit and matter of the aire: for what is smell and sent, but the verie aire, either infected with a bad, or perfumed with a good saour? Howbeit I leaue euery man free to his own opinion, as touching these points. But to returne againe to our purpose: this is certaine, that neither the Whales called *Balenæ*, nor the Dolphins, haue any gills: and yet do both these fishes breathe at certaine pipes and conduits, as it were reaching downe into their lights: from the forehead, in the *Balenæ*, and in the Dolphins, from the backe. Furthermore, the Sea-calues or Seales, which the Latines call *Phoca*, doe both breath and sleepe vpon the drie land. So do the sea Tortoises also, whereof we will write more anon.

CHAP. VIII.

¶ Of Dolphins.

THe swiftest of al other liuing creatures whatsoeuer, & not of sea-fish only, is the Dolphin, quicker than the flying fowle, swifter than the arrow shot out of a bow. And but that this fish is mouthed far beneath his snout, and in manner towards the mids of his belly, there were not a fish could escape from him, so light and nimble he is. But nature in great prouidence fore-seeing so much, hath giuen these fishes some let & hinderance, for vlesse they turned vpright much vpon their backe, catch they can no other fish: and euen therein appeareth most of all their wonderfull swiftnesse and agilitie. For when the Dolphins are driuen for very hunger to course and pursue other fishes down into the bottom of the sea, and thereby are forced a long while to hold their breath, for to take their wind again, they lance themselves aloft from vnder the water as if they were shot out of a bow; and with such a force they spring vp again, that many times they mount ouer the very sailes and mastes of ships. This is to be noted in them, that for the most part they sort themselves by couples like man and wife. They are with yong nine moneths, and in the tenth bring forth their little ones, and lightly in Summer time; and otherwhiles they haue two little dolphins at once. They suckle them at their teats, like as the whales or the *Balenæ* do: yea, & so long as their little ones are so yong that they be feeble, they carry them too and fro about them: nay when they are growne to be good big ones, yet they beare them companie still a long time, so kind and louing be they to their yong. Young Dolphins come very speedily to their growth, for in ten yeres they are thought to haue their full bignes: but they liue thirtie yeres, as hath bin known by the experience and triall in many of them, that had their taile cut for a marke when they were yong, and let go again. They lie close euery yere for the space of thirty daies, about the rising of the Dog-starre; but it is strange how they be hidden, for no man knowes how: and in very deed a wonder it were, if they could not breath vnder the water. Their manner is, to breake forth of the sea and come aland, and why they should so do, it is not known: for presently as soon as they touch the dry ground, they die: and so much the sooner, for that their pipe or conduit about-said incontinently closeth vp and is stopped. Their tongue stirreth within their heads, contrary to the nature of all other creatures liuing in the waters: the same is short and broad fashioned like vnto that of a swine. Their voice resembleth the pittifull groning of a man: they are saddle-backed, & their snout is camoise and flat, turning vp. And this is the cause that all of them (after a wonderfull sort) know the name *Simo*, and take great pleasure that men should focall them. The Dolphin is a creature that carries a louing affection not only vnto man, but also to musicke: delighted he is with harmony in song, but especially with the sound of the water instrument, or such kind of pipes. Of a man he is nothing affraid, neither auoides from him as a stranger: but of himselfe meeteth their ships, plaieth and disportes himselfe, and fetcheth a thousand frisks and gambols before them. He will swim along by the mariners, as it were for a wager, who should make way most speedily, and alwaies outgoeth them, saile they with neuer so good a fore-wind.

In the daies of *Augustus Caesar* the Emperour, there was a Dolphin entred the gulfe or poole *Lucrinus*,

A *Lucrinus*, which loued wondrous well a certain boy a poore mans son: who vsing to goe euery day to schoole from *Baianum* to *Puteoli*, was wont also about noone-tide to stay at the water side, and to call vnto the Dolphin, *Simo*, *Simo*, and many times would giue him fragments of bread, which of purpose he euer brought with him, and by this meanes allured the Dolphin to come ordinarily vnto him at his call. [I would make scruple and bash to insert this tale in my storie and to tell it out, but that *Mecenas Fabianus*, *Flavius Alfus*, and many others haue set it downe for a truth in their chronicles.] Well in proceesse of time, at what houre soeuer of the day, this boy lured for him & called *Simo*, were the Dolphin neuer so close hidden in any secreet and blind corner, out he would and come abroad, yea and skud amaine to this lad: and taking bread and other victuals at his hand, would gently offer him his back to mount vpon, and then downe went the sharpe pointed prickles of his fins, which he would put vp as it were within a sheath for fear of hurting the boy. Thus when he had him once on his back, he would carry him ouer the broad arme of the sea as farre as *Puteoli* to schoole; and in like manner conuey him backe again home: and thus he continued for many yeeres together, so long as the child liued. But when the boy was fallen sicke & dead, yet the Dolphin gaue not ouer his haunt, but vsually came to the wonted place, & missing the lad, seemed to be heauie and mourne againe, vntill for very grieffe & sorrow (as it is doubtles to be presumed) he also was found dead vpon the shore.

Another Dolphin there was not many yeeres since vpon the coast of *Affricke*, neere to the citie *Hippo*, called also *Diarrhytus*, which in like manner would take meat at a mans hand, suffer himselfe gently to be handled, play with them that swom and bathed in the sea, and carrie on his backe, who soeuer would get vpon it. Now it fell out so, that *Flavianus* the Proconsull or lieutenant General in *Affricke* vnder the Romans, perfumed and besmeared this Dolphin vpon a time with a sweet ointment: but the fish (as it should seem) smelling this new & strange smell fell to bedrow sie and sleepe, and lulled to and fro with the waues, as if it had bin halfe dead: and as though some iniurie had bin offered vnto him, went his way and kept aloofe, and would not conuerse any more for certaine moneths with men, as before-time. Howbeit in the end he came again to *Hippo*, to the great wonder & astonishment of all that saw him. But the wrongs that some great persons and lords did vnto the citizens of *Hippo*, such I mean as vsed to come for to see this sight: and namely, the hard measure offered to those townesmen, who to their great cost gaue them entertainment, caused the men of *Hippo* to kill the poore Dolphin.

D The like is reported in the citie *Iassus*, long before this time: for there was seene a Dolphin many a day to affect a certaine boy, so as he would come vnto him where soeuer he chanced to espy him. But whiles at one time about the rest he followed egerly after the lad going toward the towne, he shot himselfe vpon the dry sands before he was aware, and died forthwith. In regard hereof, *Alexander* the Great ordained that the said young boy should afterwards be the chiefe priest and sacrificer to *Neptune* in *Babylon*: collecting by the singular fancie that this Dolphin cast vnto him, That it was a great signe of the special loue of that god of the sea vnto him, and that he would be good and gracious to men for his sake.

E *Egesidemus* writeth, that in the same *Iassus* therewas another boy named *Hermias*, who hauing vsed likewise to ride vpon a Dolphin ouer the sea, chanced at the last in a sodaine storme to be ouerwhelmed with waues as he sat vpon his backe, and so died, and was brought backe dead by the Dolphin: who confessing as it were that he was the cause of his death, would neuer retire againe into the sea, but launced himselfe vpon the sands, and there died on the drie land.

The semblable happened at *Naupactum*, by the report of *Theophrastus*. But there is no end of examples in this kinde: for the *Amphilochians* and *Tarentines* testifie as much, as touching Dolphins which haue bin enamoured of little boies: which induceth me the rather to beleue the tale that goes of *Arion*. This *Arion* being a notable musician & plaier of the harpe, chanced to fall into the hands of certain mariners in the ship where he was, who supposing that he had good store of money about him, which he had gotten with his instrument, were in hand to kill him and cast him ouer boord for the said monie, and so to intercept all his gaines: he, seeing himselfe at their deuotion and mercie, besought them in the best manner that he could deuise, to suffer him yet before he died, to play one fit of mirth with his harpe; which they granted: (at his musicke and sound of harpe, a number of Dolphins came flocking about him:) which done, they turned him ouer shipbord into the sea; where one of the Dolphins tooke him vpon his backe, and carried him safe to the bay of *Tenarus*.

To conclude and knit vp this matter: In Languedoc within the prouince of Narbon, and in the territorie of Nemaufum, there is a standing poole or dead water called Laterra, wherein men and Dolphins together, vse to fish: for at one certain time of the yeare, an infinite number of fishes called Mulletts, taking the vantage of the tide when the water doth ebbe, at certain narrow weares and passages with great force break forth of the said poole into the sea: and by reason of that violence, no nets can be set and pitched against them strong enough to abide and beare their huge weight, and the streame of the water together, if so be men were not cunning and craftie to wait and espie their time to lay for them, and to entrap them. In like manner the Mulletts for their part, immediately make speed to recouer the deepe, which they do very soon by reason that the channell is neere at hand: and their onely hast is for this, to escape and passe that narrow place which affordeth opportunitie to the fishers to stretch out and spread their nets. The fisher-men being ware thereof, and all the people besides (for the multitude knowing when fishing time is come, run thither, and the rather for to see the pleasant sport) crie as lowd as euer they can to the Dolphins for aid, & call *Simo, Simo*, to help to make an end of this their game and pastime of fishing. The Dolphins soon get the care of their crie, and know what they would haue; and the better, if the North-winds blow and carrie the found vnto them: for if it be a Southerne wind, it is later ere the voice be heard, because it is against them. Howbeit, be the wind in what corner soeuer, the Dolphins resort thither flock-meale, sooner than a man would thinke, for to assist them in their fishing. And a wondrous pleasant sight it is to behold the squadrons as it were of those Dolphins, how quickly they take their places and be aranged in battell array euen against the very mouth of the said poole, where the Mulletts vse to shoot into the sea: to see (I say) how from the sea, they oppose themselves and fight against them, and driue the Mulletts (once affrighted and skared) from the deep, vpon the shelles. Then come the fishers and beset them with net and toile, which they beare vp and fortifie with strong forkes: howbeit for all that, the Mulletts are so quicke & nimble, that a number of them whip ouer, get away, and escape the nets. But the Dolphins then are readie to receiue them: who contenting themselves for the present to kill only, make foule worke and hauocke among them; & put off the time of preying and feeding vpon, vntil they haue ended the battell & archieued the victorie. And now the skirmish is hot, for the Dolphins also perceiuing also the men at worke, are the more egre and couragious in fight, taking pleasure to be enclosed within the nets, and so most valiantly charge vpon the Mulletts: but for feare lest the same should giue an occasion vnto the enemies & prouoke them to retire and flie backe, between the boats, the nets, and the men there swimming, they glide by so gently and easily, that it cannot be seen where they gat out. And albeit they take great delight in leaping, & haue the cast of it, yet none assaieth to get forth, but where the nets lie vnder them: but no sooner are they out, but presently a man shall see braue pastime between them, as they scuffle & skirmish as it were vnder the rampier. And so the confli& being ended, and all the fishing sport done, the Dolphins fal to spoile and eat those which they killed in the first shock and encounter. But after this seruice performed, the Dolphins retire not presently into the deep againe, from whence they were called, but stay vntil the morrow, as if they knew very well that they had so carried themselves, as that they deserved a better reward than one daies refection and vi&als: and therefore contented they are not and satisfied, vnlesse to their fish they haue some sops and crums of bread giuen them soaked in wine, & that their bellies ful. *Mutianus* makes mention of the semblable maner of fishing in the gulfe of Iassos: but herein is the difference, for that the Dolphins come of their own accord without calling, take their part of the bootie at the fishers hands: and euery boat hath a Dolphin attending vpon it as a companion, although it be in the night season & at torch light.

Ouer and besides, the Dolphins haue a kind of common-wealth and publick society among themselves: for it chanced vpon a time, that a king of Caria had taken a Dolphin, and kept him fast as a prisoner within the harbor: whereupon a mighty multitude of other Dolphins resorted thither, and by certain signes of sorrow and mourning that they made, euident to be perceiued and vnderstood, seemed to craue pardon and mercie for the prisoner: and neuer gaue ouer vntill the king had giuen commandement that he should be enlarged and let goe. Also the little ones are euermore accompanied with some one of the bigger sort, as a guide to guard & keep him. To conclude, they haue bene seene to carry one of their fellows when he is dead, into some place of securitie, that he should not be deuoured and torne of other sea-monsters.

The Porpuisses, which the Latines call *Tursiones*, are made like the Dolphins: howbeit they differ, in that they haue a more sad and heauie countenance: for they are nothing so gamesome, playfull, and wanton, as be the Dolphins: but especially they are snouted like dogges when they snarle, grin, and are readie to doe a shewd turne.

Here be found Tortoises in the Indian sea so great, that one only shel of them is sufficient for the rouse of a dwelling house. And among the Islands principally in the red sea, they vse Tortoise shells ordinarily for boats and wherries vpon the water.

Many waies the fisher-men haue to catch them; but especially in this manner: They vse in the mornings when the weather is calm and still, to fote aloft vpon the water, with their backs to be seen all ouer: and then they take such pleasure in breathing freely & at libertie, that they forget themselves altogether: inso much as their shell in this time is so hardened and baked with the sun, that when they would they cannot diue and snke vnder the water againe, but are forced against their wills to fote aboue, and by that meanes are exposed as a prey vnto the fishermen. Some say that they go forth in the night to land for to feed, where, with eating greedily, they qe wearie; so that in the morning, when they are returned again, they fall soon asleep aboue the water, and keepe such a snorting and routing in their sleepe, that they bewray where they be, and so are easily taken: and yet there must be three men about euery one of them: and when they haue swom vnto the Tortoise, two of them turne him vpon his backe, the third casts a cord or halter about him, as hee lyeth with his belly vpward, and then is he haled by many more together, to the land. In the Phœnician sea, they make no great ado to take them; for why, at a certaine time of the yeere they resort of themselves by great multitudes in skulls vp into the riuer Eleutherius.

The Tortoise hath no teeth, but the sides and brimmes of his neb or becke, are sharpe and keene: whereof the vpper part or chaw shutteth close vpon the nether, like to the lid of a boxe. In the sea they liue of muscles, cockles, and such small shell-fishes, for their mouths are so hard that they be able to crush and break stones therewith. Their manner is to goe aland; where among the grasse they lay egges as bigge as birds egges, to the number commonly of a hundred. When they haue so done, they hide them within the earth in some little hole or gutter, sure enough from any place where the water commeth, they couer them with mould, beat it hard downe with their brest, and so pat it smooth, and in the night time sit vpon them: they couie a whole yeare before they hatch. Some say, that the looking wisely vpon their egges with their eies serueth in stead of sitting. The female flieth from the male, and will not abide to engender, vntill such time as he pricke her behind and sticke somewhat in her taile for running away from him so fast.

The Troglodites haue among them certaine Tortoises, with broad hornes like the pegs in a Lute or Harpe, and the same will wagge and stirre so, as in swimming they helpe themselves therewith, and are guided and directed by them. And this kind of Tortoise is called *Celtium*: of exceeding great bignesse, but rare to be found, and hard to come by: for their exceeding sharpe prickles like rockes, among which they keepe, fright the *Chelônophagi* (who delight to feed vpon them) that they dare not search after them. And the Troglodites, vnto whom these Tortoises vse to swim, adore them as holy and sacred things.

There be also land Tortoises (called thereupon in the workes that are made of them in pannel wife, *Chersina*) found in the deserts and wilderness of Affrick, and principally in that part which is drie and full of sands: and they are thought to liue on nothing else but the moist dew. And in very truth, no other liuing creature there breedeth besides them.

CHAP. XI.

¶ *Who first deuised the cleauing of Tortoise shells into thin plates like pannel.*

THe first man that inuented the cutting of Tortoise shells into thin plates, therewith to seele beds, tables, cupbords, and presses, was *Carbilius Pollio*, a man very ingenious and inuentiue of of such toies, seruing to riot and superfluous expense.

CHAP. XII.

¶ *A diuision of water beasts into their severall kindes.*

THe creatures that breed and liue in the water, be not all couered and clad alike: for some haue a skin ouer them, and the same hairie, as the Seales and Water horses. Others haue but a bare skin, as the Dolphins. There be again that haue a shell like a barke, as the Tortoises: and in others, the shell is as hard as the flint, and such be the oysters, muscles, cockles, and winkles. Some be couered ouer with crusts or hard pills, as the locusts: others haue besides them, sharpe prickles, as the vchins. Some be scaled, as fishes: others are rough coated, as the Soles, and with their skins folke vse to polish and smooth wood and yuorie. Some haue a tender and soft skin, as Lampreys: others none at all, as the Pourcuttle or Pourcontrell.

CHAP. XIII.

¶ *Of the Sea-calf, or Seale.*

THe great Whales, called *Priftis* and *Balæna*, bring forth their young aliue, and perfect liuing creatures: likewise all those that are couered with haire, as the Sea-calf or Seale. She calueth on the drie land as other cattell, and whensoever she calues, she gleans afterwards as kine do. The female is tied and lined to the male, like as bitches to dogges: she neuer bringeth more than two at once, and she giueth milke at her dugs and paps, to her young. She bringeth them to the sea not before they be twelue daies old, and then she traines and acquainteth them to swim and keepe the water ordinarily. These Seales be hardly killed, vntill a man dash out their braines. In their sleepe, they seeme to low or blea, and thereupon they be called Sea-calues. Docible they be & apt to learn whatsoever is taught them. They will salute folke with a kind of countenance and regard: also with a voice such as it is, resembling a certain rude and rumbling noise. If a man call them by their name, they will turn again, and in their language answer. There is no liuing creature sleepeth more soundly than they. The fins which they vse to swim withall in the sea, serue their turnes in stead of feet to go vpon, when they be on land. Their skins, after they be flaid from their bodies, retaine still a proprietie and nature of the seas; for euer as the water doth ebbe, they are more rugged, and the haire or bristles stand vp. Moreover, their right finnes or legs are thought to haue a power and vertue to prouoke sleep, if they be laid vnder ones beds head.

CHAP. XIII.

¶ *Of fishes that be without haire, how they breed, and how many, sorts there be of them.*

OF such creatures as want haire, two only there be that bring forth their young with life: and namely, the Dolphin and the Viper. Of fishes, properly so called, there be 74 kinds: besides those that haue rough crustie skins, which I count not; wherof there be 30 sorts. Of every one of them in particular, we will speake else-where, and at another time: for now we are to treat of the natures of the chiefe and principall.

CHAP. XV.

¶ *Of the names and natures of many fishes.*

THe Tunies are exceeding great fishes: we haue scene some of them to weigh 15 talents, and the taile to be 3 cubits broad and a span. In some fresh riuers also, there be fish found full

A full as bigge: and namely, the riuer-Whale called *Silurus*, in *Nilus*; the *Lax*, in the *Rhene*; the *Artilus*, in the *Po*. This fish growes so fat with ease & lying still, that otherwhiles it weigheth 1000 pounds, and being taken with a great hooke fastened and linked to a chaine, cannot be drawne forth of the riuer but with certaine yokes of oxen. And yet as big as he is, there is one little fish in comparison of him called *Clupea*, that killeth him: for vpon a maruellous desire that he hath to a certain vein that he hath within his iawes, he bites it in sunder with his teeth, and so dispatcheth the forenamed great fish *Artilus*.

As for the *Silurus*, a cut-throat he is where soeuer he goeth, a great deuourer, and maketh foule worke: for no liuing creatures come amisse vnto him; he setteth vp all indifferently. The very horses oftentimes as they swim, he deuoures, and specially in *Mœnus*, a riuer of Germany neere to *Lisboa* or *Erlisbornis*.

B Moreover, in the riuer *Donow*, there is taken the *Mario*, a fish much like to a ruffe or *Porpuis*. Also in the riuer *Boryllhenes*, there is found a fish by report, exceeding great, with no chine nor bone at all betwene; and yet the meat thereof is passing sweet and pleasant.

Within *Ganges* a riuer of *India*, there be fishes snouted and tailed as Dolphins, 15 cubits long, which they call *Platanistæ*. And *Statius Sebosus* reports as strange a thing besides, namely, that in the said riuer there be certain wormes or serpents with two finnes of a side, sixtie cubits long, of color blew, and of that hew take their name [and be called *Cyonocides*]. He saith moreover, that they be so strong, that when the Elephants come into the riuer for drinke, they catch fast hold with their teeth by their trunks or muzzles, and mauger their hearts force them

C downe vnder the water; of such power and force they are.

The male *Tunies* haue no finnes vnder their bellies. In the spring time they goe out of the great [Mediterranean] sea, and by whole flotes and troupes enter into *Pontus*; for in no other sea doe they bring forth their young. Their young frie, which accompanie their dams (when they are lightened of their burden) into the sea againe in the autumnne, are called *Cordylæ*. Afterwards, they begin to call them *Pelamides*, and in *Larine Limosæ*, of the mud wherein they are kept: and when they be aboue one yere old, then they be *Tunies* indeed, & so called. These *Tunies* are cut into pieces, wherof the nape of the necke, the belly, and the flesh about the canell bone of the throat, are most commendable for meat, but these parcels only when they be fresh and new killed, and yet then will they rise in a mans stomacke, and make him belch sower. The other parts being full of good meat and oleous withall, are laid in salt, and so put vp in barrels and kept. And these pieces of the *Tunie* thus conduit and powdred, are called *Melandrya*, cut in slices like to oke shingles for all the world. The worst pieces of all others, be those that are next the taile, because they are not fat: but the best is that which is toward the throat: how soeuer in other fishes the taile-peece is in greatest request, as being most stirred & exercised. As for the yong *Tunies* called *Pelamides*, they are diuided & cut into parcels, that be named *A-polectii*: but when they be cut peece-meale into certain squares, those pieces are named *Cybia*.

All kind of fishes grow exceeding soon to their bignesse, and especially in the sea *Pontus*: the reason is, because a number of riuers bring fresh water into it, & in some sort make it sweet: and namely in it, there is one called *Amia*, which grows so fast & so euidently, that a man may perceiue how it waxeth from day to day. These fishes, together with the old *Tunies* and the yong, called *Pelamides*, enter into great flotes & skuls into the sea *Pontus*, for the sweet food that they there find: and euery companie of them hath their severall leaders and captains: and before them al, the *Maquerels* lead the way, which, while they be in the water, haue a colour of brimstone; but without, like they be to the rest. The *Maquerels* serue the market well in *Spaine*, and furnish the fish thambles: namely, when as the *Tunies* repaire not into their seas. As for the sea *Pontus*, there enter into it few or no rauenours that haunt and deuoure fishes, vntill it be the Seales & little Dolphins. The old *Tunies*, when they come into it, chuse the right side (vpon the coast of *Asia*) but go forth at the left. And this is the reason thereof, as it is thought, For that they see better with their right eie; & yet the sight of either of them is very good. With-
F in the channell of the *Thracian Bosphorus*, by which *Propontis* ioyneth to the sea *Euxinus*, in the very height of the Firth that diuides *Asia* from *Europe*, neer to *Chalcedon* vpon the coast of *Asia*, there standeth a rocke, exceeding white and bright withall, which is so transparent and shining from the verie bottome of the sea to the top of the water, that the *Tunies* (affrighted at the sodaine sight thereof) to auoid it, goe alwaies amaine in whole flotes, toward the cape

ouer against Bizantium, which cape therupon beareth the name of Auricorum. And therefore it is, that the Bizantines make great gaine by fishing for them: whereas the Chalcedonians haue a great misse of that commoditie, and yet the arme of the sea or frith betweene them, is not past halfe a mile, or a mile at the most, ouer. Nost they euer wait for the North wind, that (together with the tide) they might with more ease passe out of Pontus. Howbeit, the onely taking of them at Bizantium, is when they return again into Pontus. In Winter the Tunnies stirre not nor raunge abroad: but looke, wherefoeuer they are then found to be, there they take vp their Winter herbour, and make their abode vntill the spring Equinoctiall about mid-March. Many times they will accompanie the ships that saile thereby with full winde, and it is a wonderfull pleasant sight for the sailers to see them from the sterne, how for certaine houres together, and for the space of some miles, they will follow and attend vpon the poupe, be the wind neuer so good, nay, although they strike at them with the trout-spear sundry times, or lance at them some three-tined instrument, yet will they not be chafed away, nor skared. These Tunnies that thus wait vpon the ships vnder saile, some call Pompli. Many of them passe the Summer-time in Propontis, and neuer enter into Pontus. Soles likewise vse the same manner, and yet yee shall haue many Turbots there. Neither shall a man finde the Cuttil there, although there be good store of Sea-cuts or Calamaries. Moreouer, of stone fishes, such as liue among rocks, the sea Thrush, the sea Merle, and the purple shel-fishes are not to be found, where Oysters notwithstanding are in great abundance. For all such Winter in the Egean sea, called now Archipelago. Of them that enter into the sea Pontus, there is none staies there, but goes forth again, saue only the shell fish called the Saredane, or Trichia: for I thinke it good, in such diuersitie of fishes names, seeing that one and the self same fish is in many countries called diuerfly, to vse the Greeke name for the most of them. These fish, I say, alone go vp the riuier Ister, and out of it they passe againe by certain issues and conduits vnder the ground, and so descend into the Adriatick sea: and euermore a man shall see this kind of fish comming down thither, but neuer mounting vp again out of that sea. The right fishing for the Tunnies, & the only taking of them is from the rising of the star Vergiliae, to the setting of Arcturus. All the winter time besides they lie hidden in the deep, at the bottom of pits and gulfes within the sea, vnlesse they come forth to take their pleasure in some warme season, or otherwhiles when the Moon is at the full. They grow sometime so fat, that their skins will not hold, but they are ready to cleaue and burst withall. The longest time that they liue is 2 yeres and not aboue. Moreouer, there is a little creature or vermine, made somewhat like a Scorpion, & as big as a spider, which vsually will set her sharpe sting vnder the finne, both of the Tunnies and also of the sword-fish (which many times is bigger than the Dolphin) and put them to such pain, that to auoid them they oftentimes are driuen to lance themselves, and skip into the very ships. Which propertie they haue also at other times, for feare of the violence of other fishes: & most of all, the Mullers haue this cast with them; and this they doe with such exceeding swiftnesse and agilitie, that they will sling themselves otherwhiles crosse ouer the ships.

CHAP. XVI.

¶ Of presages and foretokenings by fishes, and of their diuersitie.

Nature willing to endue this Element also of the water with some Auguries, hath giuen to fishes likewise a kind of prescience and foreknowledge of things to come. And verily during the Sicilian war, as *Augustus Caesar* walked along the shore vpon the sands, there was a certain fish leapt forth of the sea, and light at his very feet. The Soothsaiers and wifards vpon this occurrent, being sought vnto, gaue this construction thereof, and presaged thereby, That they who at that time were lords of the sea, and held it in subiection, should be ranged vnder the obedience of *Caesar*, and at his deuotion. And yet at that present it is thought and said, That god *Neptune* had adopted *Sec. Pompeius* for his son, so fortunate he was, and such exploits had he achieued vpon the sea.

The female kind of fishes are commonly bigger than the males. And there are some sorts of them, whereof there be no males at all, but all females, as the Erythini and the Chani. For they be taken alwaies spawners, and full of eggs.

Fishes that be skaled, for the most part swim in troups, and fort together. The best fishing is before the sun be vp: for then fishes see least or not at all. For if the nights be cleere and Moon-shine

shine, they see as well by night as day. Moreouer, they say that it is good fishing twise in one and the same hole: for commonly vpon the second cast, the draught is better than the first. Fishes loue passing well to tast oile; they ioy also and like well in soft & gentle shewers, & therewith they will feed and grow fat. And good reason there is of it: for why? we see by experience that canes & reeds, although they breed in meers and standing waters, yet they grow not to the purpose without rain. Moreouer, it is obserued, that fish keeping euermore in one dead poole and neuer remoued, wil die wherefoeuer it be, vnlesse there fall rain water to refresh them. All fishes feele the cold of a sharpe and hard winter, but those especially, who are thought to haue a stone in their head, as the Pikes, the Chromes, Scienæ, & Pagri. If it be a bitter season in winter, many of them are taken vp blind. And therefore during those cold moneths, they lurk hidden in holes, and within rocks, like as we haue said, certain land creatures doe. But aboue all others the Lobstars called Hippuri, and the Goracini, cannot abide extremity of cold, & therefore be neuer caught in winter, vnles it be at certain times when they come forth of their holes, which they keep duly, and neuer stir but then. In like sort, the Lamproie, the Orphe, the Conger, Perches, and all Stone-fishes that loue rocks and grauell. Men say verily, that the crampe-fish, the Plaice, and the Sole lie hidden all winter in the ground, that is to say, in certain creuises and chinks which they make in the bottome of the sea. Contrariwise, some again be impatient of heat, and can as ill away with hot weather, and therefore about Mid-summer for 60 daies they lie hidden and are not to be seen: as the fish Glaucus, the Cod, and the Gilt-head. Of riuier fishes, the Silurus or Sturgeon in the beginning of the dog-daies is blasted and stricken with a planet: at other times also in a thunder & lightening he is smitten, so as therewith he is astonied and lieth for dead. And some thinke that the like accident befalleth to the sea Bream Cyprinus. And verily, all quarters of the sea throughout, feele the rising of the dog-starre: but most of all the influence and power thereof is to be seen in the streight of Bosporus: for then may a man perceiue ordinarily the reits of the sea, and the fishes flete aloft, and the sea so troubled, that euery thing is cast vp from the bottome to the vpper part of the water.

CHAP. XVII.

¶ Of the Mullet and other fishes: and that the same in all places are not of like request.

THE Mullers haue a naturall ridiculous qualitie by themselves, to be laughed at: for when they be afraid to be caught, they wil hide their head, and then they thinke they be sure enough, weening that all their body is likewise hidden. These Mullers neuertheless are so lecherous, that in the season when they vse to ingender, in the coasts of Phoenice & Lianguedock, if they take a milter out of their stews or pooles where they vse to keep them, and draw a long string or line through the mouth and gills, and so tie it fast, and then put him into the sea, holding the other end of the line still in their hands, if they put him again vnto them, they shall haue a number of spawners or femals follow him hard at taile to the bank side. Semblably, if a man do the same with a female in spawning time, hee shall haue as many milters follow after her. And in this manner they take an infinit number of Mullers.

In old time our ancestors set more store by the Sturgeon, & it carried the name aboue all other fishes. He is the only fish that hath the scales growing ouer the head: hee swims against the streame. But now adaies there is no such reckoning & account made of him: wherat I maruell much, considering he is so hard and feldome to be found. Some call him Elops: afterwards *Cornelius Nepos*, and *Laberius* the Poet and maker of mery rimes haue written, that the sea Pikes and the cods got away all the credit from the Sturgeon, & were of greatest request. As for the Pikes aforesaid, the best and most commendable of all others be they which are called Lanati, as a man would say cotton Pikes, for the whitenesse & tenderesse of their flesh. Of cods there be two sorts, Callariæ, or Haddocks, which be the lesse: and Bacchi, which are neuer taken but in the deep, and therefore they are preferred before the former. But the Pikes that are caught in the riuier be better than all others. The fish called Searus now carrieth the price & praise of all others, & this fish alone is said to chew eud, to liue of grasse and weeds, and not to prey vpon other fishes. In the Carpathian sea great store of them is found: & by their good will they neuer passe the cape or promontorie Lectos in Troas. In the daies of *Tiberius Claudius* the Emperor,

Optatus his freed man (who sometime had bin a slave of his) and then Admiral and Lieutenant G
 generall of a fleet vnder him, brought them first out of that sea, and with them stored the whole
 coast of our seas betweene Sicilia and Campania. Order was taken by straight inhibition for
 the first five yeares, to kill those that were put into those seas, but if any were taken, that they
 should be cast in againe. In proceesse of time many of them came to be found and taken vp all a-
 long the coast of Italy, whereas before, they were not to be had in those parts. See how glutton-
 rie, and the desire to please a dauidy tooth, hath deuised means forsooth to fow fish, & to trans-
 plant them as it were, so to store the sea with strange breed: so that now we need no more mar-
 tuell, that forraine birds and foules, set out of far countries, haue their aeries at Rome, and breed
 there. Next to those fishes aboue named, the table is serued with a kinde of Lamprels or Ele-
 points like to sea Lampreis, which are bred in certain lakes about the Alps, and namely, in that
 of Rhœtia called Brigantinus: & a strange thing it is, that they should be so like in proportion
 to those of the sea. Of all other fishes of any good account, the Barbell is next, both in request,
 and also in plenty. Great in quantity they are not: for hardly shall you find any of them weigh
 about two pound, neither wil they feed & grow in stews and ponds. They are bred only in the
 Northern sea: and neuer shall you see them in the coast of the West Ocean. Moreover, of this
 Fish there be sundry sorts. And they liue all of Reirs and Seawds, of Oysters, of the fat mud, &
 of the flesh of other Fishes. They haue all of them 2 beards, as it were, hanging down euident-
 ly from their nether jaw. The worst of all this kind, is that which is called Lutarius: & this fish
 hath another named Sargis, that willingly euermore beareth him company: for whiles hee is
 rooting into the mud (wherof he taketh his name) then commeth the Sargus, and deuoures the
 food that is raised therewith. Neither are the Barbells much accepted that keep neere the shore
 and in the river within land. But the best simply are those that tast like vnto the shel-fish Con-
 chylilium: *Penestella* gaue them the name Mulli, of certaine moyles or fine shooes, which in co-
 lour they do resemble. They cast spawn thrice in one yere at the least: for so often their young
 Fry is seen. Our great belligods say, that a Barbell when he is dying, changeth his hue, and turn-
 neth into an hundred colours: the prooffe and experience wherof may be seen if he be put into
 a glasse: for through it, it is a prety sport to see how he altereth and changeth his scales beeing
 ready to die, one way into a pale and wan colour, otherwhiles into a reddish hue, one after ano-
 ther for many times together. *M. Apicius* (who was a man of all others most inuentiue and won-
 derful for his witty deuises to maintain riot and excess) thought it was a singular way to thide
 and kill these Barbells in a certain pickle, called the Roman Allies sauce (see how euen such a
 thing as that, hath found a synname forsooth & a proper addition.) And he also went about to
 prouoke men to deuise a certain manger or broth made of their liuers, like to that dripping or
 graue called Alec, that commeth of Fishes when they pine and corrupt. For surely it is more
 easie for me to say who set men a work that way first, than set down who woon the best game in
 the end, and was the greatest glutton. *Asiurus Celer*, a man of great calling and high place, who
 sometime had bin Consul, shewed his prodigallitie in this Fish, & it was when *C. Caligula* was
 Emperor: for he gaue for one Barbell eight thousand Sesterces. Certes, the consideration here-
 of rauisheth my mind, and carrieth it away to behold & wonder at those, who in their reproofs
 of gluttonie and gourmandise, complained that a cooke carried a greater price in the market
 than a good horse of seruice. For now adaies a cooke will cost as much as the charge of a tri-
 umph: and one Fish as deare as a cook. And to conclude, no man is better esteemed and regar-
 ded more, than he that hath the most cunning cast to wast the goods, & consume the substance
 of his lord and master.

CHAP. XVIII.

¶ Of the Barbil, the fish Coracinus, Stock-fish, and Salmon.

Licinius Mutianus reporteth, That in the red sea there was taken a Barbell that weighed 80 M
 pounds. Oh, what a price would he haue borne among our gluttons here with vs! What
 would he haue cost our prodigall spendthrifts, if hee had bin taken vpon our coasts neere
 Rome? Moreover, this is the nature of fish, that some are chiefe in one place, and some in ano-
 ther. As for example, the Coracinus in Egypt carrieth the name for the best fish. At Gades in
 Spain, the Doree or Goldfish, called Zeus and Faber. About the Isle Ebusus, the Stock-fish is
 much

A much called for; whereas in other places it is counted but a base muddy and filthy fish; and
 which no where else they know how to seeth perfectly, vnlesse it be first well beaten with cud-
 gels. In the country of Aquitaine or Guienne in France, the riuer Salmon passeth all other sea
 Salmons whatsoeuer.

Of fish, some haue many folds of gills, some single, others double. At these gills they deli-
 uer again and put forth the water that they take in at the mouth. You may know when fish be
 old by their hard scales: and yet all fishes are not scaled alike. There be two lakes in Italy at
 the foot of the Alps, named Larius and Verbanus, wherein fishes are to be seen euery yeare at
 the rising of the star Vergilia, thicke of scales, and the same sharp pointed like to the tongues
 of buckles, wherewith horsemen or men at arms do fasten their greiues: and neuer els but about
 that moneth do they appeare.

CHAP. XIX.

¶ Of the fish Exocoetus.

The Arcadians make wonderous great account of their Exocoetus; so called, for that hee
 goeth abroad and taketh vp his lodging on the dry land to sleep. This fish (by report) a-
 bout the coast Clitorius hath a kind of voice, and yet is without gills. And of some he
 is named Adonis. But besides him, the sea Tortoises also, (called Mures Marini) the Polypes
 & Lampreis vse to go forth to land. Moreover, in the riuers of India there is one certaine fish
 doth so, but it leaps back again into the water: for whereas many other fishes passe out of the
 sea into riuers and lakes, there is great euident reason thereof, namely, for that they are in
 more safetie there, both to cast their spawn vnder the wind where the water is not so rough, and
 full of waues: and also to bring forth their little ones, because there be no great fishes to de-
 uour them. That these dumb creatures should haue the sence herof, thus to know these causes,
 and obserue duly their times, is very strange and wonderfull, if a man would found the depth
 thereof: but more he would maruell to consider, how few men there be that know which is the
 best season for fishing, while the Sun passeth through the signe Pisces.

CHAP. XX.

D ¶ A diuision of fishes according to the forme and shape of their bodies.

OF sea fishes some be plain and flat, as Byrts or Turbors, Solds, Plaice, & Flounders. And
 these differ from the Turbors onely in the making of their body: for in a Turbot the
 right side turns vpward, and in a Plaice the left. Others again be long and round, as the
 Lamprey and Congre. And hereupon it is that they haue a difference in their fins, which Na-
 ture hath giuen to fish in stead of feet. None haue aboue foure, some two, some three, others
 none at all. Only in the lake Fucinus there is a fish which in swimming vseth 8 fins. All that
 be long and slipperie, as Eccles and Congres, haue ordinarily two in all, and no more. Lampries
 haue none to swim with, ne yet perfect gills: all of this kind winde and wriggle with their bo-
 dies within the water, and so erche forward like as serpents doe vpon the earth. They creepe
 also when they are vpon dry land, and therefore such liue longer than the rest out of the water.
 Also of the fore said flat fishes some haue no finnes, as the puffin or fork-fish: for their breadth
 serueth them sufficiently to beare them vp, and to swim. And amongst those that are counted
 soft, the Pourcuttell hath no fins, for his feet standeth him in stead of fins to swim with.

CHAP. XXI.

¶ Of Yeales.

Yealess liue 8 yeares. And if the North wind blow, they abide aliue without water 6 daies,
 but not so long in a Southern wind. But yet in Winter time they may not endure to be
 in a little water, nor if it be thick and muddy: wherupon, about the rising of the star Vir-
 gilia they be commonly taken, for that the riuers about that time vse to be troubled. Their
 feeding most commonly is in the night. Of all fish, they alone, if they be dead, stote not about
 the water.

¶ *The manner of taking them in the lake Benacus.*

THere is a lake in Italy called Benacus, within the territorie of Verona, through which the riuer Mincius runs: at the issue whereof euerie yere about the moneth of October, when the Autumne star Arcturus ariseth, whereby (as it euidently appeareth) the lake is troubled as it were with a winter storme and tempest, a man shall see rolling amongst the waues a wonderfull number of these Yeels wound & tangled one within another: insomuch as in the leapweeles and weernets deuised for the nonce to catch them in this riuer, there be found sometime a thousand of them wrapped together in one ball.

¶ *Of the Lamprey.*

THe Lamprey spawneth at all times of the yere, whereas all other fishes are deliuered of their yong at one certain season or other. The eggs or spawne grow to a great passe exceeding soon. If they chance to slip out of the water to dry land, the common sort is of opinion that they ingender with serpents. The male or milter of this kinde *Aristotle* calls Myrus. And herein is the difference, that the spawner, properly called Muræna, is of sundry colors, and withall but weake: but the Mylter or Myrus is of one hue, & withall very strong, hauing teeth standing without his mouth. In the North parts of France all the Lampreis haue in their right jaw seuen spots, resembling the seuen stars about the North pole, called *Charlemaines Waine*. They be of a yellow colour, and glitter like gold so long as the Lampreies be aliue; but with their life they vanish away, and be no more seene after they be dead. *Vedius Pollio*, a gentleman of Rome by calling, and one of the great fauorits and followers of *Augustus Cesar*, deuised experiments of cruelty by means of this creature: for hee caused certain slaues condemned to die, to be put into the stewes where these Lampreies or Murænes were kept, to be eaten and deuoured by them: not for that there were not wilde beafts ynow upon the land for this feat, but because he tooke pleasure to behold a man torne and pluckt in pieces all at once: which pleasant sight he could not see by any other beaft upon the land. It is said, if they taste vineger, of all things, they become enraged and mad. They haue a very thin and tender skinne: contrariwise, Yeels haue as thick & tough. And *Perrins* writeth, that boyes vnder 17 yeres of age were wont to be swinged and whipped with Yeeles skinnes, and therefore they were freed from all other mulct and punishment.

¶ *Of flat and broad Fishes.*

OF flat and broad fishes there is another sort, which in lieu of a chine or backe bone haue a gristle. As the Ray or Skait, the Puffin like vnto it, the Maids or Thornbacke, and the Crampfish: moreover, those which the Greekes haue termed by the names of their sea Cow, their Dog-fish, their Egle and Frog of the sea. In this rank are to be ranged the Squall also, albeit they are not so flat and broad. All this kind in general *Aristotle* hath called in Greek *Selache*, and he was the first that gaue them that name: we in Latine cannot distinguish them, vnlesse we call them all Cartilaginea, that is to say, Gristly fish. But all the sort of them that deuoure flesh are such: and their manner is to feed lying backward, like as we obserued in the dolphins. And whereas other fishes cast spawn which resemble knots of eggs; these gristly fishes only, as also those great ones which we call Cete, i. Whales, bring forth their yong aliue. And yet I must except one kind of them which they call Rana, i. sea Frogs.

¶ *Of Echeneis [i. the Stay-ship.]*

THere is a very little fish keeping vsually about rocks, named Echeneis: it is thought, that if it settle and stick to the keele of a ship vnder water, it goeth the slower by that means: whereupon

A whereupon it was so called: and for that cause also it hath but a bad name in matters of loue, for enchanting as it were both men and women, and bereauing them of their heat and affection that way: as also in law cases, for delay of issues and iudicial trials. But both these imputations and slanders it recompenseth again with one good vertue and commendable quality that it hath: for in great bellied women if it be applied outwardly it stayeth the dangerous flux of the womb, and holds the child vnto the full time of birth: howbeit it is not allowed for meat to be eaten. *Aristotle* thinketh, that it hath a number of feet, the fins stand so thick one by another.

B As for the shell fish Murex, *Atutianus* saith it is broader than the Purple, hauing a mouth neither rough nor round, ne yet with a becke pointed cornered-wise, but plain and euene, hauing a shell on both sides winding and turning inward. These fishes chanced vpon a time to cleaue fast vnto a ship, bringing messengers from *Periander*, with commission to gueld all the Noblemens sonnes in *Gnidos*, and stayed it a long time, notwithstanding it was vnder saile, and had a strong gale of a fore-winde at the poupe. And hereupon it is, that these Shell fishes for that good seruice are honoured with great reuerence in the Temple of *Venus* among the *Gnidians*.

But to returne again vnto our Stay-Ship Echeneis, *Trebius Niger* saith it is a foot long, and five fingers thicke, and that oftentimes it stayeth a ship. And moreover, as he saith, it hath this vertue being kept in salt, to draw vp gold that is fallen into a pit or well being neuer so deep, if it be let downe and come to touch it.

¶ *The changeable nature of Fishes.*

THe Cackarels change their colour: for these fishes being white all Winter, wax blacke when Summer comes. Likewise the Mole or Lepo called Phycis, doth alter her hue: for howsoeuer all the yere besides it be white, in the Spring it is speckled. This is the only fish that builds vpon the reites and mosse of the sea, and layes her eggs or spawneth in her nest. The sea Swallow flieth, and it resembleth in all points the bird so called. The sea Kite doth the same.

¶ *Of the fish called the Lanterne, and the sea Dragon.*

THere is a fish comes ordinarily about the water, called Lucerna, for the resemblance that it hath of a light or lantern: for it litleth forth the tongue out of the mouth, which seemeth to flame and burne like fire, and in calme and still nights giues light and shineth. There is another fish that puts forth hornes about the water in the sea, almost a foot and halfe long, which thereupon tooke the name Cornuta. Againe, the sea Dragon if he be caught and let go vpon the sand, worketh himselfe an hollow trough with his snout incontinently, with wonderfull celeritie.

¶ *Of bloudlesse fishes.*

Some fishes there be which want bloud, whereof wee now will speake. Of them are three sorts: first, those which be called Soft: secondly, such as be couered within crusts: & in the last place, they that are inclosed within hard shels. Of the first sort, counted soft, be reckoned the sea Cut or Calamarie, the Cuttle, the Polype, and the rest of that sort. These haue their head betwene their feet and the belly, and euery one of them haue 8 feet. As for the Cuttil and Calamarie, they haue two feet apiece longer than the rest, and the samerough, wherewith they conuey and reach meat to their mouths: and with those they stay themselves as it were with anchor hold against the surging waues: the rest of their feet be smal like hairs, and with them they hunt and catch their prey.

Also the Calamarie lanceth himselfe out of the water, as if he were an arrow; and euen so dorth little Scalops. The male of the Cuttles kind are spotted with sundry colors more dark and blackish, yea and more firme and steady than the female. If the female be smitten with a Trout-speare, or such like three-forked weapon, they wil come to aid & succor her: but she again is not so kind to them, for if the male be stricken she will not stand to it, but runs away. But both of them, the one as well as the other, if they perceiue that they be taken in such streights that they cannot escape, shed from them a certain black humor like to ink, and when the water therewith is troubled and made duskish, therein they hide themselves and are no more seen.

Of Polypes or Pourcontrels there be sundry kinds. They that keep neere the shore are bigger than those that haunt the deep. All of them help themselves with their fins and armes, like as we do with feet and hands: as for their taile, which is sharp and two forked, it serueth them in the act of generation. These Pourcontrels haue a pipe in their back, by the help whereof they swim all ouer the seas; and it they can shift one while to the right side, & another while to the left. They swim awry or sidelong with their head aboue, which is very hard and as it were puffed vp so long as they be aliue. Moreouer, they haue certain hollow concauities dispersed within their claws or arms like to ventoses or cupping glasses, whereby they will stick to, and cleaue fast as it were by sucking, to any thing, which they clasp & hold so fast, lying vpward with their bellies, that it cannot be plucked from them. They neuer settle so low as the bottom of the water, and the greater that they be, the lesse strong they are to clasp or hold any thing. Of all soft fishes they only goout of the water to dry land, especially into some rough place, for they cannot abide those that are plaine and euen. They liue vpon Shell-fishes, and with their haire or strings that they haue they will twine about their shels and crack them in pieces: wherefore a man may know where they lie and make their abode, by a number of shels that lie before their nest. And albeit otherwise it be a very brutish and senselesse creature, so foolish withall, that it will swim and come to a mans hand; yet it seems after a sort to be witty and wise, keeping of house and maintaining a familie: for all that they can take they carry home to their nest. When they haue eaten the meat of the fishes, they throw the empty shels out of dores, and lie as it were in ambuscado behind, to watch and catch fishes that swimme thither. They change their colour oftsoons, and resemble the place where they be, & especially when they be afraid. That they gnaw and eat their own elces and arms, is a meere tale; for they be the congres that do them that shrewd turn: but true it is that they will grow againe, like as the taile of snakes, adders, & lizards. But among the greatest wonders of nature, is that fish which of some is called Nautilus, of others Pompilos. This fish, for to come aloft aboue the water turnes vpon his back, and raiseth or heaueth himself vp by little and little: and to the end he might swim with more ease, as disburdened of a sinke, hee dischargeth all the water within him at a pipe. After this, turning vp his two foremost claws or armes, he displaieth and stretcheth out betwene them a membrane or skin of a wonderfull thinnesse: this serueth him in stead of a saile in the aire aboue water: with the rest of his arms or claws he roweth and laboreth vnder water, & with his taile in the mids he directs his course, and steereth as it were with an helme. Thus holds he on and maketh way in the sea, with a faire shew of a foist or gally vnder saile. Now if he be afraid of any thing in the way, he makes no more ado but drawes in water to ballace his body, and so plungeth himselfe down, and sinketh to the bottom.

Of the Polypus or Pourcontrell kind with many feet, is the Ozæna, so called of the strong fauor of their heads, for which cause especially, the Lampreys follow in chase after him.

As

As for the Many-feet or Pourcuttels, they lie hidden for two months together: and aboue two yeares they liue not. They die alwaies of a consumption or Phthisicke: the female sooner than the males, and ordinarily after that they haue brought forth their yong frie. I cannot ouerpasse but record the reports of *Trebius Niger*, one of the traine and retinue of *L. Lucullus* Proconsull in Boetia, which he vpon his knowledge deliuered as touching these Many-feet fishes called Polypi, namely, That they are most desirous and greedie of cockles, muscels, and such like shell-fishes: and they againe on the contrarie side, so soone as they feele themselves touched of the Polypes, shut their shels hard, and therewith cut asunder their claws or armes, that were gotten within: and thus fall they to feed vpon those, who sought to make a prey of them. [Now in very truth these shell-fishes, all of them see not at all, neither haue they any other sense, but tasting of their meat, & feeling of their drinke.] These Polypi foreseeing all this, lie in wait to spiewhen the said cockles, &c. gape wide open, and put in a little stone between the shels, but yet beside the flesh & bodie of the fish, for feare lest if it touched and felt it, he would cast it forth againe: thus they theecue, and without all daunger and in securitie get out the fleshie substance of the meat to deuoure it: the poore cockles draw their shels together for to clasp them between (as is aboue said) but all in vaine, for by reason of a wedg between, they will not meet close nor come neere together. See how subtle and craftie in this point these creatures be, which otherwise are most fortish and senselesse. Moreouer, the said *Trebius Niger* affirmeth, that there is not any other beast nor fish in the sea more daungerous to doe a man a mischief within the water, than is this Pourcuttle or Many-feet Polypus: for if he chance to light on any of these diuers vnder the water, or any that haue suffered shipwracke and are cast away, he assailes them in this manner: He catcheth fast hold of them with his claws or armes, as if he would wrestle with them, and with the hollow concauities and noukes between, keepeth a sucking of them; and so long he suckes and fokes their blood (as it were cupping-glasses set to their bodies in diuers places) that in the end he draweth them drie. But the only remedie is this, to turne them vpon their backe, and then they are soone done and their strength gone: for let them lie so, they stretch out themselves abroad, and haue not the power to clasp or comprehend any thing. And verily all liuing creatures in the sea loue the smell of them exceeding well, which is the cause that fishers besmare and anoint their nets with them, to draw and allure fishes thither.

The rest which mine author hath related as touching this fish, may seem rather monstrous **D**lies and incredible, than otherwise: for he affirmed, that at Carteia there was one of these Polypi, which vsed commonly to go forth of the sea, and enter into some of their open cisterns and vaults among their ponds and stews, wherein they keep great sea-fishes, and otherwhiles would rob them of their salt-fish, and so go his waies againe: which he practised so long, that in the end he gat himselfe the anger and displeasure of the maisters and keepers of the said ponds and cisterns, with his continuall & immeasurable filching: whereupon they staked vp the place and empalled it round about, to stop all passage thither. But this thief gaue not ouer his accustomed haunt for all that, but made meanes by a certaine tree to clamber ouer and get to the fore-said salt fish; and neuer could he be taken in the manner, nor discouered, but that the dogges by their quick sent found him out and baied at him: for as he returned one night toward the sea, they assailed and set vpon him on all sides, and therewith raised the fore-said keepers, who were affrighted at this so sudden an alarm, but more at the strange sight which they saw. For first and foremost this Polype fish was of an vmeasurable and incredible bignesse: and besides, he was besmeared & beraied all ouer with the brine and pickle of the fore-said salt-fish, which made him both hideous to see to, and to sinke withall most strongly. Who would euer haue looked for a Polipe there, or taken knowledge of him by such marks as these? Surely they thought no other, but that they had to deale and encounter with some monster: for with his terrible blowing and breathing that he kept, he draue away the dogs, and otherwhiles with the end of his long stringed winding feet, he would lash and whip them; somtimes with his stronger claws like arms he rapped and knoked them well and surely, as it were with clubs. In summe, he made such good **F**shift for himselfe, that hardly and with much adoe they could kill him, albeit he receiued many a wound by trout-spears which they launced at him. Wel, in the end his head was brought and shewed to *Lucullus* for a wonder, & as big it was as a good round hoghead or barrel that would take and containe 15 Amphores: and his beards (for so *Trebius* tearmed his claws and long-stringed feet) carried such a thicknesse and bulke with them, that hardly a man could fathome

one

one of them about with both his armes, such knockers they were knobbed and knotted like clubs, and withall 30 foot long. The concavities within them, and hollow vessels like great bassons, would hold 4 or 5 gallons apeece: and his teeth were answerable in proportion to the bigness of his bodie. The rest was faued for a wonder to be seene, and weighed 700 pound weight. This author of mine *Trichinus* affirmeth, that Cuttels also and Calamaries have been cast vpon that shore, full as big. Indeed in our sea there be Calamaries taken of 5 cubits long, and Cuttels of twaine, in length: and these liue not about two yeares

Mutianus reporteth, that himselfe saw in Propontis another kind of fish carying as it were a ship of his owne, and making faile with it like to some galley: and a shel-fish it was fashioned with a keele like to a barge or barke, with a poupe embowed and turned vp: yea and armed as it were in the prow with a three-forked pike. Within which lay hidden (as he saith) another liuing creature called Nauplius, resembling a Cuttle fish; and for no other reason in the world, but to make sport and play with it for companie. Now the manner of this pastime and sailing was in two sorts: for if it were a calme sea and the winds downe, the Nauplius afore-said that went as a passenger in this shell, would put downe his feet into the water like ores, and row therewith; but if a gale of wind were aloft, he would stretch the same length & make them serue in stead of an helme to steere withall; and then the Coquill or shel-fish would spread and display it selfe like sailes, to gather wind: so as the one of them tooke a pleasure to carrie, in manner of the vessell; the other had his delight to labour as a mariner, and to direct withall like a pilot. Thus these two fishes (otherwise senselesse & blockish) take their pleasure together, vnles peraduenture it fall out vnhappily (for certain it is that such a sight as this presages no good to sailers) that men marre their sport, and either part them asunder, or force them to sinke vnder water.

The Lobsters (becing of that kinde which wanteth bloud) haue a tender and brittle cruft to couer and defend them. For five months they lie hidden. The Crabs likewise, who at the same time keep clofe & secret: and both of them in the beginning of euery spring cast their old coats or shels as snakes do their skins, & take them that be new & fresh. All others of this kind swim within the water: but the Lobsters stote aloft, and creepe as it were vpon the water. So long as they are secure of any feare and danger, they go directly straight, letting downe their hornes at length along their sides, which naturally by themselves haue a round point or bob at the end: but if they be in any feare, go vp those hornes straight, and then they creepe byas and goe side-long. With these hornes they oftentimes maintaine battaile one with another. Of all creatures, this only hath a tender and short kind of flesh, which in the seething will not hang together, vnlesse it be foddren aliue in scalding water, and then it will be stiffe and callous as brawne.

CHAP. XXXI.

Of Sea-crabs, Vrchins of the sea, and great Vrchins called Echinometra.

As for the Lobsters, they loue rocks and stonie places: but Crabs delight in soft and delicate places. In winter, they seeke after the warme or sun-shine shore: but when summer is come, they retire into the coole and deepe holes in the shade. All the sort of them take harme and paire by winter: in autumn and spring, they battle and wax fat, and especially when the moon is at the full: because that planet is comfortable in the night time, & with her warme light mitigareth the cold of the night. Of these Crab-fishes, there be many kinds: to wit, Lobsters, Creyfishes of the sea, crabs of Barbarie called Maia, Grampels, Grits or Pungiers, Crabs of Heraclea, yellow riuier Creyfishes, and diuers others of more base account. As for the Lobsters, they differ from the rest in taile. In Phoenicia, there is a kind of Crabs called Hippoe, or rather Hippois (that is to say, Horses or Horsmen) which are so swift, that it is impossible to ouertake them. Crabs liue long: eight clees or feet they haue apeece, all crooked and hooked: the female hath the fore clee double, the male but single. Moreover, two of the legs or arms are forked and toothed like pincers. The vpper part of these foreclawes doth stir: the nether part moeth not. The right leg in them all is bigger than the left. When they come in skuls all together (as sometimes they doe) they are not able to passe one by another the streights of the sea Pontus about Constantinople, whereupon they are forced to returne back againe and fetch a compasse about, and the bearen way with their tracks may be seene. The least of all these kind of Crabs, is called

A called Pinnotheres [or Pinnoterer] and for his smalnesse most subiect and exposed to iniurie. But as subtil and crafty he is as he is little; for his maner is to shroud and hide himself within the shels of empty oysters, and euer as he growes bigger and bigger, to go into those that be wider. Crabs when they be afraid will recule backward as fast as they went forward. They will fight one with another, and then ye shall see them iur and butt with their hornes like rams. Singular good they are against the bitings and stings of serpents. It is reported, that while the Sun is in the signe Cancer, the bodies within of dead crabs that lie without the water vpon drie land, wil turne to be scorpions. Of the same sort that the crabs be are the vrchins of the sea called Echini; and these in stead of feet haue certain pointed prickles. Their maner of going is to roll themselves and tumble round; and therefore many times shall yee finde them with their prickles worne. And of this sort be they that are called Echinometra. The longest prickles they haue of all others, and the least shels or cases wherein they are. Neither are they all of the same colour of glasse; for about Torone they are found to be white, hauing small prickles. They haue all of them siue eggs when they lay, but they are bitter. Their mouths stand in the mids of their bodies, bending down toward the earth. It is said they haue a fore-knowledge of a sea tempest: for by reason that they are so round, and therefore soone whirled and caried here and there, they fall then to labor and gather stones, wherewith they charge and peise their bodies as with ballast, that they may abide more stedfast, for that they are not willing to weate their prickles with rolling and turning ouer and ouer: which when the mariners and sailers perceiue once, they presently cast many anchors and stay their ships.

CHAP. XXXII.

Of Winkles and Sea Snacles.

I N the same ranke are to be reckoned the Winkles as well of land as water. When they put themselves out of their shels they thrust out two hornes that they haue, and wil pluck them in again when they list. Eyes they haue none to see withall, and therefore these little hornes sense them in good stead to sound, as it were, and try the way as they go.

CHAP. XXXIII.

Of Scallops: of the greatest Winkle called Murex, and other kinds of shell-fishes.

T He great Scallops in the sea are counted for the same race which lie hid also in the time as well of great heat as cold. They haue certaine nailes as it were shining like fire in the night season; yea in their very mouthes that eat them. As for the Pourcelanes or Murexes, they haue a stronger skaled shell; as also all the kind of Winkles great and small. Wherini a man may see the wonderfull varietie of Nature in this play and pastime of hers, giuing them so many and sundry colours, with such diuersitie of formes and figures; for of them yee shall haue flat and plain, hollow, long, horned like the moon croissant, full round, halfe round, & cut as it were iust through the mids, bow-backt, and rising vp, smooth, rough, toothed and indented like a saw, ridged and chamfered between, wrinkling and winding vpward to the top like Calatropes, bearing out sharpe points in the edges, without forth broad and spread at latge, within rolled in pleits. Moreover, there be other distinct shapes besides all these: some be striped and raied with long streaks, others crested and blasing with a bush of long haire: some againe crisped and curled, others made like an hollow gutter or pipe: some fashioned as it were a comb, others waving with plaits one aboue another tile-wise, others framed in the manner of a net or lattise: some are wrought crooked and byas, others spred out directly in length. A man shall see of them those that are made thick and mossie thrust together and compact, others stretched forth at large: ye shall haue of them wrapt and lapt one within another: and to conclud, yee shall find them run round into a short fast knot, and all their sides vnited together in one: some flat and plain good to giue a clap, others turning inward crooked like a comet, made as it were to sound and wind withall. Of all these sorts, the Pourcelanes or Venus-Winkles swim aboue the water, and with their concavities or hollow part which they set into the weather, help themselves in stead of sailes, and so gathering wind, saile as it were aloft vpon the sea. The manner

of the Scalops is to skip, and otherwhiles they will leap forth of the water. They also can find G the means to make a boat of themselves, and so flore aboue and saile handfomly.

CHAP. XXXIV.

¶ *The riches of the sea.*

BVt what meane I all this while to stand vpon these small trifling matters, when as in very truth the ouerthrow of all honestie, the ruin of good maners, and in lieu thereof all riot and superfluity proceeds from these shel-fishes, and from nothing so much? for now the world is grown to this passe, that there is nothing in it whatsoeuer so chargeable to mankind, nothing so hurtfull and dangerous as is the very sea, and that so many waies; namely, in furnishing the table with such varietie of dishes, in pleasing and contenting the taste with so many dainty and delicate fishes; and those carry the highest price that be gotten with greatest hazard and danger of those that take them, otherwise they be of no regard and value to speake of.

CHAP. XXXV.

¶ *Of Pearles, how and where they be found.*

HOwbet al that before named is nothing in comparifon of the Purples, pretious Coquils and Pearls that come from thence. It was not sufficient belike to bring the seas into the kitchen, to let them down the throat into the belly, vnlesse men and women both caried them about in their hands and eares, vpon their head, and all ouer their body. And yet what societie and affinitie is there betwixt the sea and apparell? what proportion betwixt the waues and surging billowes thereof, and wooll? for surely this element naturally receiues vs not into her bosom vnlesse we be stark naked: and set the case there were so great good fellowship with it and our bellies; how comes our backe and sides to be acquainted with it? But wee were not contented to feed with the peril of so many men, vnlesse we be clad and araied also therewith. O the folly of vs men! see how there is nothing that goeth to the pampering and trimming of this our carcasse, of so great price and account, that is not bought with the vtmost hafard, and costeth not the venture of a mans life! But now to the purpose. The richest merchandise of all, and the most soueraigne commoditie throughout the whole world are these Pearles. The Indian ocean is chief for sending them: and yet to come by them, we must go and search among those huge & terrible monsters of the sea, which we haue spoken of before: we must passe ouer so many seas, and saile into far countries so remote, and come into those parts where the heate of the sun is so excessiue and extreme; and when all is done we may perhaps misse of them: for euen the Indians themselves are glad to seeke among the Islands for them, & when they haue done all they can, meet with very few. The greatest plenty of them is to be found in the coast of Taprobane and Toidis, as hath bin said before in our Cosmographie and description of the world: and likewise about Perimula a promontorie and city of India. But the most perfect and exquisite of all others be they that are gotten about Arabia, within the Persian gulf. This shell-fish which is the mother of Pearle, differs not much in the maner of breeding and generation from the Oysters: for when the season of the yeare requireth that they should engender, they seeme to yawne and gape, and so do open wide; and then (by report) they conceiue a certaine moist dew as seed, wherewith they swell and grow big, and when time commeth labor to be deliuered hereof: and the fruit of these shell fishes are the Peares, better or worse, great or small, according to the qualitie and quantitie of the dew which they receiued. For if the dew were pure and cleare which went into them, then are the Pearles white, faire, and Orient: but if grosse and troubled, the Pearles likewise are dimme, foule, and duskyish; pale (I say) they are, if the weather were close, darke, and threatning raine in the time of their conception. Whereby (no doubt) it is apparant and plaine, that they participate more of the aire and sky, than of the water and the sea; for according as the morning is faire, so are they cleere: but otherwise, if it were misty and cloudy, they also will be thicke and muddy in colour. If they may haue their full time and season to feed, the Pearles likewise will thriue and grow bigge; but if in the time it doth chance to lighten, then they close their shells together, and forwant of nourishment

A rishment are kept hungrie and fasting, and so the pearles keepe at a stay and prosper not accordingly. But if it thunder withall, then suddenly they shut hard at once, and breed only those excellences which be called Physemata, like vnto bladders putt vp and hooued with wind, & no corporal substance at all: and these are the abortiue & vntimely fruits of these shel fishes. Now those that haue their full perfection, and be found and good indeede, haue many folds and skins wherein they be lapt, not vnproperly as it may be thought, a thicke, hard, and callous rind of the body, which they that be skillfull do pill and clenfe from them. Certes, I cannot chuse but wonder how they should so greatly be affected with the aire, and joy to much therein: for with the same they wax red, and lose their native whitenesse and beau. ie, exen as the bodie of a man or woman that is caught and burnt with the sun. And therefore those shells that keep in the maine sea, and lie deeper than that the sun-beames can pierce vnto them, keep the finest and most delicate pearles. And yet they, as orient as they be, waxe yellow with age, become riuclcd, and looke dead without any liuely vigor: so as that commendable orient lustre (so much sought for of our great lords and costly dames) continueth but in their youth, and decaieith with yeares. When they be old, they will proue thicke and grosse in the very shells, and sticke fast vnto their sides, so as they cannot be parted from them, vnlesse they be filed asunder. These haue no more but one faire face, and on that side are round, for the backe part is flat and plaine; and hereupon such are called Tympania, as one would say, Bell bearies. We see daily of these shells which serue as boxes to carrie sweet perfumes and precious ointments, and most commendable they are for this gift, that in them there be pearls of this sort naturally growing together like twins. The pearle is soft and tender so long as it is in the water, take it forth once and presently it hardeneth. As touching the shell that is the mother of Pearle, assoon as it perceiuerth and feelerh a mans hand within it, by and by she shutteth, and b that means hideth and couereth her riches within: for well woteth she that therefore she is sought for. But let the fisher looke well to his fingers, for if she catch his hand between, off it goeth: so trenchant and sharp an edge she carrieth, that is able to cut it quite a two. And verily this is a just punishment for the theefe, and none more: albeit he be furnished and armed with other means of reuenge. For they keep for the most part about craggie rocks, and are there found: and if they be in the deepe, accompanied lightly they are with curst Sea-dogs. And yet all this will not serue to skar men away from fishing after them: for why? our dames and gentlewomen must haue their eares behanged with them, there is no remedie. Some say, that these mother-pearles haue their kings and capitaines, as Bees haue: that as they haue their swarmes led by a master Bee, so euery troupe and companie of these, haue one speciall great and old one to conduct it, and such commonly haue a singular dexteritie and wonderfull gift to preuent and auoid all daungers. These they be that the dyvers after pearles are most carefull to come by: for if they be once caught, the rest scatter asunder and be soone taken vp within the nets. When they be thus gotten, it is said that they be put vp into earthen pots and well couered with salt: and when the salt hath eaten and consumed all the flesh within, then certaine kernels that were within their bodies (and those be the very pearles) fall down and settle to the bottome of those pots. There is no doubt but with much vse they will weare, yea and change colour thorough negligence, if they be not well looked vnto. Their chief reputation consisteth in these fise properties, namely, if they be orient white, great, round, smooth, and weightie. Qualities I may tell you, nor easily to be found all in one: inso-much as it is impossible to find out two perfectly sorted together in all these points. And hereupon it is, that our dainties and delicacies here at Rome, haue deuised this name for them, and call them Vnions; as a man would say, Singular, and by themselves alone. For surely the Greeks haue no such tearmes for them, neither know they how to cal them: nor yet the Barbarians, who found them first out, otherwise than Margaritæ. In the very whitenesse it selfe, there is a great difference among them. That which is found in the red sea, is the clearer and more orient. As for the Indian pearle, it resemblerh the skales and plates of the stone called Specularis; howsoeuer otherwise it passeth all others in greatnesse. The most commendation that they haue is in their colour, namely, if they may be truly called Exaluminati, orient and cleare as Alume.

F They that be goodly great ones, are commendable in their degree. As for those that are long and pointed vnto, growing downward broader and broader like a peare, or after the manner of Alabafter boxes, full and round in the bottome, they be called Elenchi. Our dames take a great pride in a brauerie, to haue these not only hang dangling at their fingers, but also two or

three of them together pendant at their eares. And names they haue forsooth newly deuised for them, when they serue their turne in this their wanton excesse and superfluitie of riot: for when they knocke one against another as they hang at their eares or fingers, they call them *Crotalia*, i. Cymbals: as if they tooke delight to heare the sound of their pearles ratling together. Now adayes also it is growne to this passe, that meane women and poore mens wiues affect to weare them, because they would be thought rich: and a by-word it is amongst them, That a faire pearle at a womans eare is as good in the street where she goeth as an huiusier to make way, for that euery one will giue such the place. Nay, our gentlewomen are come now to weare them vpon their feet, and not at their shoo latches only, but also vpon their starrops and fine buskins, which they garnish all ouer with pearle. For it wil not suffice nor serue their turne to carie pearles about them, but they must tread vpon pearles, goe among pearles, and walke as it were on a pavement of pearles.

Pearles were wont to be found in our seas of Italie, but they were small & ruddie, in certain little shell fishes which they call *Myæ*: but more plenty of such were taken vp in the streights of Bosphorus neere Constantinople. Howbeit, in Acarnania there is a little Cochle called *Pinna*, i. a Nacre, which engendreth such. V. hereby it may appeare, that there be more than one sort of Mother-pearles. For king *Inba* likewise hath left in writing, that in Arabia there is a kind of shell fish like vnto a Scallop, saue that it is not chamfered, but thick and rough like a sea Vrecheon, which beares Pearles within the very flesh of the fish, like vnto haile stones. But now adayes there be no such mother-pearles come to our coasts. Neither be there found in Acarnania any of value and reputation. For wily they are all in manner without proportion, neither round nor weighty, and of a marbled colour. They rather about the cape of Actium are better, and yet they be but little ones: like as they also which are taken in the coasts of Mauritania. *Alexander Polyhistor*, and *Sudmes*, are of opinion that they will age, and in the end lose their colour. That they be solid and not hollow within, is euident by this, that with no fall they will breake. But they be not alwaies found in the midst of the flesh within the mother-pearles, but here & there, sometime in one place, and sometime in another. Verily I haue seene of them about the brim and edges of the shell, as if they were readie to goe forth: and in some 4, in others five together. Vnto this day few of them haue been knowne to weigh about halfe an ounce and one scripture. In * Brittain it is certain that some dogrow; but they be small, dim of colour, and nothing orient. For *Julius Caesar* (late Emperour of famous memorie) doth not dissimule, that the cuirace or breast-plate which he dedicated to *Venus* mother within her temple, was made of English pearles.

Imy selfe haue seene *Lollia Paulina* (late wife, and after widdow, to *Caius Caligula* the emperor) when she was dressed and set out, not in statly wise, nor of purpose for some great solemnity, but only when she was to go to a wedding supper, or rather vnto a feast when the assurance was made, & great persons they were not that made the said feast: I haue seene her, I say, so beset and bedeckt all ouer with hemeraulds and pearles, disposed in rewes, ranks, and courses one by another: round about the attire of her head, her cawle, her borders, her peruk of hair, her bondgrace and chaplet; at her eares pendant, about her neck in a carcanet, vpon her wrist in bracelets, & on her fingers in rings; that she glittered & shon again like the sun as she went. The value of these ornaments, she esteemed and rated at * 400 hundred thousand Sestertij: and offered openly to proue it out of hand by her bookes of accounts of reckonings. Yet were not these jewels the gifts and presents of the prodigall prince her husband, but the good and ornaments from her owne house, fallen to her by way of inheritance from her grandfather, which he had gotten together euen by the robbing and spoiling of whole prouinces. See what the iustice and end was of those extortions and outrageous exactions of his: this was it, That *M. Lollius* slandered and defamed for receiuing bribes & presents of the kings in the East; and being out of fauor with *C. Caesar*, sonne of *Augustus*, and hauing lost his amitie, dranke a cup of poison, and preuented his iudiciall triall: that forsooth his neece *Lollia*, all to be hanged with jewels of 400 hundred thousand Sestertij, should be seene glittering, and looked at of euery man by candle-light all a supper time.

If a man would now of the one side reckon what great treasure either *Curius* or *Fabricius* carried in the pompe of their triumphs; let him cast a proffer and imagine what their shews were, what their seruice at the table was: and on the other side, make an estimate of *Lollia*, one only woman

A man, the dowager of an Emperor, in what glory she sitteth at the bound, would not he with rather, that they had been pulled out of their chariots, and neuer triumphed, than that by their victories the state of Rome should haue grown to this wastfull excesse & intollerable pride? And yet this is not the greatest example that can be produced of an excessive riot and prodigality.

Two only pearles there were together, the fairest and richest that euer haue bene knowne in the world: and those possessed at one time by *Cleopatra* the last queen of Egypt, which came into her hands by means of the great kings of the East, and were left vnto her by descent. This princeesse, when *M. Antonius* had strained himselfe to doe her all the pleasure he possibly could, & had feasted her day by day most sumptuously, & spared for no cost in the height of her pride and wanton brauerie (as being a noble curtezan, and a queene withall) began to debase the expence and prouision of *Antonius*, and made no reckoning of all his costly fare. When he thereat

B demanded againe how it was possible to goe beyond this magnificence of his, she answered againe, that she would spend vpon him at one supper * 100 hundred thousand Sestertij. *Antonius*, who would needs know how that might bee (for he thought it was impossible) laid a great wager with her about it, and shee bound it againe, and made it good. The morrow after, when this was to be tried, and the wager either to be won or lost, *Cleopatra* made *Antonius* a supper (because she would not make default, and let the day appointed to passe) which was sumptuous and roiall enough: howbeit, there was no extraordinary seruice seene vpon the board: whereat *Antonius* laughed her to scorne, and by way of mockerie required to see a bill with the account of the particulars. She againe said, that whatsoeuer had been serued vp already, was but the ouerplus

C vpon the full summe that she was leazed at: yea, her selfe alone would eat about that reckoning, and her owne supper should cost * 600 hundred thousand Sestertij, and with that commanded the second seruice to be brought in. The seruitors that waited at her trencher (as they had in charge before) set before her one only crewet of sharpe vineger, the strenght whereof is able to resolute pearles. Now she had at her eares hanging these two most precious pearles, the singular and only jewels of the world, and euen Natures wonder. As *Antonius* looked wistly vpon her, and expected what shee would doe, shee tooke one of them from her eare, steeped it in the vineger, and so soon as it was liquified, dranke it off. And as shee was about to doe the like to the other, *L. Plancius* the iudge of that wager, laid fast hold vpon it with his hand, and pronounced withal,

D That *Antonius* had lost the wager. Whereat the man fell into a passion of anger. There was an end of one pearle: but the fame of the fellow thereof may goe with it: for after that this braue queen the winner of so great a wager, was taken prisoner and deprived of her roiall estate, that other pearle was cut in twaine, that in memoriall of that one halfe supper of theirs, it should remaine vnto posteritie, hanging at both the eares of *Venus* at Rome, in the temple of Pantheon. And yet as prodigall as these were, they shall not go away with the prize in this kinde, but shall lose the name of the chiefe and principall, in superfluitie of expence. For long before their time, *Clodius* the sonne of *Aescop* the Tragedian Poet, the only heire of his father, who died exceeding wealthie, practised the semblable in two pearles of great price: so that *Antonius* needeth not to be ouer proud of his Triumvirate, seeing that he hath to match him in all his magnificence, one little better than a stage-plaier: who vpon no wager at all laid, (and that was more princely, and done like a king) but only in a brauerie, and to know what tast pearles had, mortified them in venegre, and drunke them vp. And finding them to content his pallat wondrous well, because he would not haue all the pleasure by himselfe, and know the goodnesse thereof alone, he gaue to euery guest at his table one pearle apeece to drinke in like manner.

Fenestella writeth, that after Alexandria was conquered and brought vnder obedience to the Romans, Pearles were rife at Rome, and commonly vfed of euery man: also, that about the troublesome time of *Sylla* they began first to be in request: and those were but small ones, and of no price. Howbeit, he is grossely deceiued, and in a great error. For *Albius Stilo* doth report in his Chronicle, that in the time of warre against *Ingritha*, the faire and goodly great pearles began

F to be named *Vniones*. These Pearles (to say a truth) are of the nature (in a manner) of an inheritance to descend by perpetuities. They follow commonly in right the next heires. When they passe in saile, they go with warrantize, in as solemne manner as a good lordship.

As for the rich Purples, and the precious Conchyles, euery coast is full of them. And yet to

that excesse and prodigalitie we are now growne, and out wanton roior (the mother of all inordinate and wastfull expence) hath made them well neere as deere as Pearles.

CHAP. XXXVI.

¶ The nature of purple fishes, and the Murex or Burret.

Purples liue ordinarily seuen yeers. They lie hidden for 30 daies space about the dogdaies, like as the Murexes or Burrets do. They meet together by troupes in the spring, and with rubbing one against another, they gather and yeeld a certaine clammy substance and moisture in manner of waxe. The Murexes doe the like. But that beautifull colour, so much in request for dying of fine cloth, the Purples haue in the midst of the neck and jawes. And nothing else it is, but a little thin liquor within a white veine: & that is it which maketh that rich, fresh, and bright colour of deepe red purple roses. As for all the rest of this fish, it yeeldeth nothing. Fishers strue to get them aliue, for when they die, they cast vp and shed that precious teinture and juice, together with their life. Now the Tyrians, when they light vpon any great Purples, they take the flesh out of their shels, for to get the bloud out of the said veine: but the lesser, they presse and grind in certain milles, and so gather that rich humor which issueth from them. The best purple colour in Asia is this, thus gotten at Tyros. But in Affricke, within the Island Meninx, and the coast of the Ocean by Getulia. And in Europe, that of Laconica. This is that glorious colour, so full of state and maiestie, that the Roman Lictors with their rods, halberds, and axes make way for: this is it that graceth and setteth out the children of princes and noblemen: this maketh the distinction between a knight and a counsellor of state: this is called for & put on when they offer sacrifice to pacifie the gods: this giueth a lustre to all sorts of garments: to conclude, our great Generals of the field, and victorious captaines in their triumphs weare this purple in their mantles, enterlaced and embrodered with gold among. No maruell therefore if Purples be so much sought for: and men are to be held excused, if they run a madding after Purples. But how should the other shell-fishes called Conchylia, be so deere and high prized, considering the teinture of them carries so strong and stinking a fauor, so fullen and melancholie a colour, enclining to a blew or watchet, and resembling rather the angrie and raging sea in a tempest? But to come to the particular description. The Purple hath a tongue of a finger long, pointed in the end so sharpe, and hard withall, that it is able to bore an hole and pierce into other shell-fishes, and thereby shee feeds and gets her liuing. In fresh water they will die all, or if they be plunged and throwne in any riuer: otherwise, after they be taken, they will continue aliue 50 daies, euen with that viscous and slimie humor of their owne. All shel-fish in general grow apace in a very small time: but Purples soonest of all others: for in one yere they wil come to their full bignesse. Now, if I should lay a straw here, and proceed no further in this discourse of Purples and such like, surely our luxurious and riotous spendthrifts would thinke they had great wrong, and were defrauded of their right: they might I say complaine of me, & condemne me of idlenesse, and negligence. Therefore I care not much to put my head within the diers shops and work-houses: that like as euery man for the necessity of this life, knows how the price of come goes; euen so our fine folke and braue dainties, who take such pleasure and delight in these colors, may be perfect what is the reason of this their only life. In the first place, these shel-fishes that serue either for purple colors, or other lighter dyes of the Conchylia, are all one in matter: the difference only is in temperature more or lesse. And indeed, reduced they may all be into two principall sorts. For the lesse shell called Buccinum, fashioned like vnto that horn or corner, wherewith they vse to wind and sound, whereupon in tooke that name, hath a round back, and is cut like a saw in the edges. The other is named Purpura, shooteth out a long backe like a guttur, and within the one side it doth writhe and turne hollow in forme of a pipe, out of which the fish puts forth a tongue. Moreover, this Purple is bestudded (as it were) euen as far as to the sharpe top or turbant thereof round about with sharpe knobs pointed, lightly seuen in number: which the sea-cornet Buccinum hath not. But this is common to both, that looke how many roundles they haue like tendrils clasping about them, so many yeares old they bee. As for the Corner Buccinum, it sticketh alwaies to great stones and rockes, and therefore is euer found and gathered about them.

CHAP.

CHAP. XXXVII.

¶ How many sorts there be of Purples.

Purples haue another name, and be called Pelagia, as one would say, Fishes of the deep sea. But in truth there be many sorts of them, & those differing either in place where they keep, or in food wherof they liue. The first Lutense, i. muddy, because it is nourished of the corrupt and rotten mud: the second Algense (the worst of all) feeding vpon reits or sea weeds named Alga: the third, Tanienis (better than the former twaine) for that it is gathered and taken vp about the brims & borders of the sea, called for the resemblance of fillets or lists in a cloth, Taniaz. And yet this kind yeeldeth but a light colour, and nothing deepe: there be of them also, which they terme Calculosa, of the sea grauell, which is wondrous good for all these kinde of wilkes and shell fishes. And last of all, which simply be the very best, the Purples Dialetæ, that is to say, wandring too and fro, changing their pasture, and feeding in sundry soils of the sea (the muddy, the weedie, and the grauelly.) Now these Purples are taken with small nets, and thinne wrcught, cast into the deep. Within which, for a bait to bite at, there must be certain winckles and cockles, that will shut and open, & be ready to snap, such as we see these limpins be, called Miruli. Halfe dead they should be first, that being new put into the sea again, & desirous to reuiue and liue, they might gape for water: and then the Purples make at them with their pointed tongue, which they thrust out to annoy them: but the other feeling themselves pricked therewith, presently shut their shels together, & bite hard. Thus the Purples for their greedinesse are caught and taken vp, hanging by their tongues.

CHAP. XXXVIII.

¶ The fishing time for Purples.

The best time to take Purples, is after the dog star is risen, & before the Spring: for, when they haue made that viscous musilage in manner of wax, their iuice and humour for colour is ouer liquid, thin, & waterish. And yet the purple diers know not so much, nor take heed thereof, whereas indeed the skill thereof is a speciall point of their art, and wherein lieth all in all. Well, when they are caught, as is abouesaid, they take forth that vein before mentioned, and they lay it in salt, or else they do not well: with this proportion ordinarily, namely, to euery hundred weight of the Purple liquor, a Sestier or pint and halfe of salt. Full three dayes and no more it must thus lie soking in powder. For the fresher that the colour is, so much is it counted richer and better. This don, they seeth it in leads, & to euery Amphore, (i. which containeth about eight wine gallons) they put one hundred pound and a halfe just, of the colour so prepared. Boile it ought with a soft and gentle fire, and therefore the tunnel or mouth of the furnace must be a good way off from the lead and cawdron. During which time, the workemen that tend the lead, must cftsoones skim off and clense away the fleshie substance, which cannot chuse but stick to the veines which containeth the iuice or liquor of purple before said. And then they continue 10 daies, by which time ordinarily the lead or vessell wil shew the liquor cleere, as if it were sufficiently boiled. And to make a triall thereof, they dip into it a fleece of wool wel rensed & washt out of one water into another: & till such time, that they see it giue a perfect dye, they stil ply the fire, & giue it a higher seething. That which staineth red, is nothing so rich as that which giueth the deepe & sad blackish color. When it is come to the perfection, they let the wooll lie to take the liquor 5 houres: then they haue it forth, rouse and card it, and put it in againe, vntil it hath drunke vp all the colour, as much as it will. Now this is to be obserued, that the sea corner Buccinum makes no good colour of it selfe: for their dye wil shed & lose the lustre. And therefore vsually they ioine to it the sea Purple Pelagium, which maketh too deepe and brown a colour: vnto which it giueth a fresh & liuely teinture, as it were in grain, and so maketh that sad purple which they desire. Thus by mixing & medling the force of both together, they mend one another, while the lightnesse or fadnesse of the one doth quicken and raise, or els dorr and take downe the colour of the other. To the dying of a pound of wooll, they vse this proportion of two hundred Buccina or sea Cornets, ioined with a hundred and eleuen Pelagian Purples: & so commeth that rich Amethyst or purple violet colour, so highly commended

mended aboue aliother. But the Tyrians make their deep red purple, by dipping their wool first in the liquor of the Pelagian purples only, whiles it is not thoroughly boiled to the heighth, but as it were green yet and vnripe; and thereof they let it take what it can drinke. Soone after they change it into another caudron or lead, where the colour of the sea Cornets alone is boiled. And then it is thought to haue a most commendable and excellent dye, when it is as deep a red as bloud that is cold and setled, blackish at the first sight, but looke between you and the light, it carieth a bright and shining lustre. And hereupon it is, that *Homer* calleth bloud, Purple.

CHAP. XXXIX.

¶ When they began at Rome to weare Purple first.

I Find in Chronicles, that Purple hath bin vsed in Rome time out of mind. Howbeit, *K. Romulus* neuer ware it but in his roial habit or mantle of estate, called *Trabea*. And wel known it is, that *Tullus Hostilius* was the first Roman king, who after he had subdued the Tuscans, put on the long purple robe named *Pretexta*, and the cassock broched & studded with scarlet in broad guards. *Nepos Cornelius* who died in the daies of *Augustus Caesar* the Emperor, When (quoth he) I was a yong man, the light violet purple was rife and in great request, & a pound of it was sold for a * 100 deniers: and not long after the Tarentine red purple or skarlet was much called for, and of the same price. But after it, came the fine double died purple of Tyros, called *Dibapha*: and a man could not buy a pound of it for a * 1000 deniers, which was the price of ten pound of the other. *P. Lentulus Spinther* in his *Ædileship* of the chaire, first ware a long robe embroidered with it, and was checked and blamed therefore. But now adaies (quoth *Nepos*) what is he that will not hang his parlour and dining chamber therewith, and haue carpets, cushions, & cupboard clothes thereof. And it is no longer ago when *Spinther* was *Ædile*, than in the seuen hundredth year after the foundation of Rome, euen when *Cicero* was *Consull*. This purple in those daies was called *Dibapha*, twice died: & that was counted a matter of great cost, & very stately withall and magnificent. But now ye shall haue no purple cloths at all of any reckoning, but they haue their double die. As for the cloth died with the purple of the shel-fish *Conchylia*, the maner of making the colour, and dying in all respects is the same, saue that there be no sea Cornets vsed thereto. Moreouer, the iuice or liquor for that colour, is tempered with water in stead of the filthy pisse and vrine of a man, altogether vsed in the other: and therein is sodden but the halfe proportion of colours to the foresaid tinctures. And thus is made that light pale stammel so highly commended, for being short of the deep rich colour: and the lesse while that the wooll is suffered to drinke the fill, the more bright and fresh it seemeth.

CHAP. XL.

¶ The prices of wooll died with these colours.

AS for these colours, they are valued dearer or cheaper, according to the coasts where these fishes are gotten more or lesse. Howbeit, it was neuer known that in any place, a pound of the right purple wooll, died with the Pelagian colour, or of the colour it selfe, was more worth than * 500 Sesterces: nor a pound of the Cornets purple cost aboue one hundred. I would they knew so much that pay so deare for these wares by retaile here at home, and cannot haue them, but at an excessiue rate. But here is not all, neither is this an end of expence that way, for one still draweth on another: and men haue a delight to spend and lay on still one thing after another: to make mixtures and mixtures again, and so to sophisticate the sophistications of Nature: as namely to paint and die their feelings, euen the very embowed roofs and arches in building: to mix and temper gold and siluer together, therewith to make an artificiall metall *Electrum*: and by adding brasse or copper thereto, to haue another metall, counterfeiting the Corinthian vessels.

CHAP. XLI.

¶ The manner of dying the Amethyst, Violet, or Purple, the Chrymson and Scarlet in grain, and the light Stammel or Lustie-gallant.

It would not suffice our prodigal spendthrifts to rob the precious stone Amethyst of his name, and to apply it to a colour; but when they had a perfect Amethyst die, they must haue it to be drunken

A drunken againe with the Tyrcan purple, that they might haue a superfluous and double name compounded of both (*Tyriamethistus*) correspondent to their two-fold cost and duple superfluitie. Moreouer, after they haue accomplished fully the colour of the *Conchylum*, they are not content vntill they haue a second die in the Tyrian purple lead. It should seeme, that these double dies and compounded colours, came first from the error and repentance of the workman when his hand missed: and so was forced to change and alter that which he had done before, and vtterly misliked. And hereof forsooth is come now a pretty cunning and art thereof: and the monstrous spirits of our wastfull persons are grown to wish and desire that, which was a fault amended first: and seeing the two-fold way of a double charge and expence troden before them by the diers, haue found the meanes to lay colour vpon colour, and to ouercast and strike a rich die with a weaker, so that it might be called a more pleasant and delicate colour. Nay it will not serue their turn to mingle the aboue-said tinctures of sea fishes, but they must also do the like by the die of land-colours: for when a wooll or cloth hath taken a crimson or skarlet in graine, it must be died againe in the Tyrian purple, to make (I would not else) the light, red, and fresh Lustie-gallant.

As touching the Graine, seruing to this tincture, it is red, and commeth out of Galatia, (as we shall shew in our story of earthly plants) or else about *Emerita* in Portugall, and that of all other is of most account. But to knit vp in one word these noble colours, note this, That when this Graine is but of one yeres age, it maketh but a weake tincture; but after foure yeres, the strength thereof is gone. So that neither young nor old it is of any great vertue. Thus I haue sufficiently and at large treated of those means which men and women both, so highly esteeme, and thinke to make most for their state and honourable port, and setting out of themselves in the best manner.

CHAP. XLII.

¶ Of the Nacre, or his guide and keeper, Pinnoter: and the percei-
nance of fishes.

THE Nacre also called *Pinna*, is of the kind of shell-fishes. It is alwaies found and caught in muddie places, but neuer without a companion, which they cal *Pinnoter*, or *Pinnophylax*. And it is no other but a little shrimpe, or in some places, the smallest crab, which beareth the Nacre companie, and waites vpon him for to get some vituals. The nature of the Nacre is to gape wide, and sheweth vnto the little fishes her feelie body, without any eie at all. They come leaping by and by close vnto her: and seeing they haue good leaue, grow so hardie and bold, as to skip into her shel & fill it full. The shrimp lying in spiall, seeing this good time and opportunitie, giueth token thereof to the Nacre, secretly with a little pinch. She hath no sooner this signall, but she shuts her mouth, and what soeuer was within, cruishes and kills it presently: and then she deuides the boorie with the little crab or shrimp, her sentinell and companion. I maruell therefore so much the more at them who are of opinion, that fishes and beasts in the water haue no sence. Why, the very Cramp-fish *Torpedo*, knowes her own force & power, and being her selfe not benumbed, is able to astonish others. She lieth hid ouer her, and cares within the mud vnseen, ready to catch those fishes, which as they swim ouer her, be taken with a nummednesse, as if they were dead. There is no meat in delicate tenderesse, preferred before the liuer of this fish. Also the fish called the * sea-Frog, (and of others the sea-Fisher) is as crafty euery whit as the other: It puddereth in the mud, and troubleth the water, that it might not be seen: and when the little feely fishes come skipping aboue her, then she puts out her little hornes or Barbils which she hath bearing forth vnder her eies, and by little and little tiltheth and tolleth them so neere, that she can easily seaze vpon them. In like manner the Skate and the Turbot lie secret vnder the mud, putting out their finnes, which stir and crawle as if it were some little wormes; and all to draw them neer, that she might entrap them. Euen so doth the Ray-fish or Thorn-back. As for the Puffen or Fork-fish, he lieth in await like a theefe in a corner, ready to strike the fishes that passe by with a sharpe rod or pricke that he hath, which is his weapon. In conclusion, that this fish is very subtill and crafty, this is a good prooffe, That being of all others most heauie and slow, they are found to haue in their bellie the Mulletts, which of all others be the swiftest in swimming.

CHAP.

Alluding to the word Amethyst, which resists drunkennesse.

* Diabole de mer.

CHAP. XLIII.

¶ *Of the Scolopendres, the sea-Foxes, and the Glanis.*

These Scolopendres of the sea, are like to those long earewigs of the land, which they call Centipedes, or many-feet. The manner of this fish is this, when she hath swallowed an hook to cast vp all her guts within, vntill she hath discharged her self of the said hook, and then she sups them in againe. But the sea-Foxes in the like danger haue this cast with them, namely to gather in and let it go downe into the throat more and more still of the line, vntill he come to the weakest part thereof, which he may easily fret and gnaw asunder. The Glanis is more flie and warie than they both: for his propertie is to bite at the backe of the hooke, and not to goble it vp whole, but nibble away all the bait, and leaue the hooke bare.

CHAP. XLIII.

¶ *Of the Ram-fish.*

This fish is a very strong theef at sea, and makes foule work where he comes: for one while he squats close vnder the shade of big ships that ride at anker in the bay, where he lies in ambush to wait when any man for his pleasure would swim and bath himselfe, that so he might surpriſe them: otherwhiles he puts out his nose about the water, to spie any small fisher boats comming, and then he swimmeth close to them, ouerturneth and sinketh them.

CHAP. XLV.

¶ *Of those that haue a third or middle nature, and are neither liuing creatures nor yet Plants: also of the sea-Nettle-fishes, and Spunges.*

I verily for my part am of opinion, that those which properly are neither beasts nor plants, but of a third nature between or compounded of both (the sea-Nettles I mean, and Sponges) haue yet a kinde of sense with them. As for those Nettles, there be of them that in the night raunge too and fro, and likewise change their colour. Leaues they carry of a fleshie substance, and of flesh they feed. Their qualitie is to raise an itching smart, like for all the world to the weed on the land so called. His manner is, when he would prey, together in his body as close, freight and stiffe as possibly may be. He spieth not so soon a filly little fish swimming before him, but he sprardeth and displaieth those leaues of his like wings; with them he claspeth the poore fish, and so deuoures it. At other times, he lies as if he had no life at all in him, suffering himselfe to be tossed and cast too and fro among the weeds, with the waues of the sea: and look what fish soeuer he toucheth as he is thus floting, hee sets a smart itch vpon them, and whiles they scratch and rub themselves against the rockes for this itch, hee sets vpon them and eates them. In the night season he lieth for sea-Vrchens and Scalops. When he feeleth ones hand to touch him, he changeth colour, and draweth himselfe in close together on a heape: and no sooner toucheth he one, but the place will itch, sting, and be ready to blister: make not good hast to catch him quickly, he is hidden out of hand and gone. It is thought verily, that his mouth lyeth in his root, and that he voideth his excrements at a small pipe or issue aboue, where those fleshie leaues are.

Of Spunges, we find three sorts: the first thicke, exceeding hard, and rough, and this is called Tragos: a second, not all so thicke, and somewhat softer; and that is named Manon: the third is fine and yet compact, wherewith they make sponges to cleane and scoure withall, and this is teamed Achilleum. They grow al vpon rocks: and are fed with wilkes or shel-fish, with naked fish and mud. That they are not senselesse, appeares hereby, for that when they feele that one would pluck them away, they draw in and retire back hard, so as with greater difficulty they are pulled from the rocke. The like doe they when they be beaten vpon with waues. That they liue vpon some food, it is manifest by the little coquill & muscle shels that be found within them. And some say, that about Torone they continue still aliue after they be pulcked from the rocks: and that of the roots which are left behind, they grow againe. Moreover, vpon those rocks from whence they be pulled, there is to be seen as it were some bloud sticking; & especially in those of A fricke, which breed among the Syrtis. The Mane, which otherwise be the least, become very great & most soft withall, about Lycia. But they be more delicate which are nourished in the

A the deep gulfes, where least wind or none is stirring. The rough kind are in Hellespont: and the fine and masse, about the cape Malea. In sun-thine places they will corrupt and putrifie; and therefore the best are in the deep gulfes and creeks, not exposed to the Sun. They be of the same dusk and blackish colour when they liue, as they are afterwards being foked & full of moisture. They cleaue to rocks neither by any one part, nor yet entire and whole all ouer: for there are between, certain void pipes 4 or 5 commonly, by which they are supposed to receiue their food and nourishment. There be more of these pipes and concavities, but aboute they are grown together hard and not hollow. A certain pellicle or thin skin a man may perceiue them to haue at their roots. For certain it is knowne, that they liue long. The worst kind of them all, be those that are called Aplyſia, because vnneth they may bee separated, nor clenfed and made cleane, they are so foule, for great pipes they haue; thicke they are besides throughout, and very masse.

CHAP. XLVI.

¶ *Of Hound-fishes or Sea-dogs.*

The dyuers that vse to plunge into the sea, are annoied very much with a number of Sea-hounds that come about them, and put them in great jeopardie. And they say, that these fishes haue a certain dim cloud or thin web, growing & hanging ouer their heads, resembling broad, flat, and gristly fishes, which clingerth them hard, and hindreth them from retiring backe and giuing way. For which cause the said dyuers (as themselves say) carry downe with them certaine sharp pricks or goads fastened to long poles: for vnlesse they be proked at and pricked with them, they will not turn their backe, by reason (as I suppose) of a mist before their eyes, or rather of some feare & amazednesse that they be in. For I neuer heard of any man that found the like cloud or mist (for this term they giue vnto that vnhappy thing what-euer it be) in the range of liuing creatures. But yet much ado they haue and hard hold with these Hound-fishes notwithstanding; for they lay at their bellies and groines, at their heeles, and snap at euery part of their bodies that they can perceiue to be white. The onely way and remedy is to make head directly affront them, and to begin with them first, and so to terrifie them: for they are not so terrible to a man, but they are as afraid of him againe. Thus within the deepe they are indifferently euen matched: but when the dyuers mount vp and rise againe aboue water, then there is some ods betwene, and the man hath the disaduantage, and is in more danger; by reason that whiles he laboureth to get out of the water, he faileth of means to encounter with the beast, against the streame and sources of the water. And therefore his only recourse is, to haue help and aid from his fellowes in the ship; for hauing a cord tied at one end about his shoulers, he shaketh it with his left hand, to giue signe what danger hee is, whiles hee maintaineth fight with the right, by taking into it the punchcon with the sharpe point before said; and so at the other end they draw him to them: and they need otherwise to pull and hale him but softly: many when he is neere once to the ship, vnlesse they giue him a sudden jerke and snatch him vp quickly, they may be sure to see him worried and deuoured before their face; yea and when they are at the point to be plucked vp, and euen now ready to go aboard, they are many times caught away out of their fellows hands, if they bestir not themselves the better, and put their owne good will to the help of them within the ship; namely, by plucking vp their legs and gathering their bodies nimble together round as it were in a ball. Well may some from ship-board proke at the dogs aforesaid with forks, others thrust at them with Trout speares & such like weapons, and all neuer the neere, so craftie and cautalous is this foule beast, to get vnder the very belly of the barge, and so maintain combat in safety. And therefore all the care that these fishers haue, is to prouide for this mischiefe, and to lie in wait for to entrap these fell, vnhappy, and shrewd monsters.

CHAP. XLVII.

¶ *Of those fishes that lie within a stonie and hard flintie shell: also of those that haue no sense: and of other nasty and filthy creatures.*

The greatest securitie that fishers and dyuers haue of safety, is when they see the broad flat gristly fishes; for certain it is, that they be neuer in any place where hurtfull and noisome beasts

beasts do haunt: which is the cause that these dyuers which ducke and plunge for sponges, call G those fishes Sacred.

We must needs confesse, that fishes within stone shels, haue small or no sense, as namely oysters. Many are of the nature of very Plants, to wit, those that they call Holothuria: also Pulmones, resembling the lungs of a beast: and Star-fishes, made in forme of stars (such stars I meane as it pleaseth the Painter to draw.) In sum, what is there not bred within the sea? Euen the very fleas that skip so merily in summer time within victualling houses and Inns, and bite so shroudly: as also lice that loue best to lie close vnder the haire of our heads, are there engendered & to be found: for many a time the fishers twitch vp their hooks, and see a number of these skippers and creepers settled thicke about their baits which they laied for fishes. And this vermine is thought to trouble the poore fishes in their sleep by night within the sea, as well as vs on the land. Last of all, some fishes there be, which of themselves are giuen to breed fleas and lice, among which the Chalcis, a kind of Turbot, is one. H

CHAP. XLVIII.

¶ Of venomous Sea-fishes.

Moreover, the sea is not without her deadly poisons: for the Sea-hare, which keepeth in the Indish sea, is so venomous, that the very touching of him is pestiferous; & presently causeth vomiting and ouerturning of the stomacke, not without great danger. They which be found in our sea, seeme to be a peece or lump of flesh without all forme or fashion, in colour only resembling the land Hare. But with the Indians they be full as big, and resemble their Hare, only it is more stiffe and hard. And verily they cannot possibly be taken there aliue. The dragon or spider of the sea, is as dangerous & mischieuous a creature as the other: and with the pricks that stick forth of his chine and back-bone, hee doth much hurt. But in no place is there any more detestable and pernicious, than is the pike that standeth out vpon the taile of Trigonius, which we in Latine call *Pastinaca*, the Puslin or Forkfish of the sea, the which pike is five inches long. So venomous it is, that if it be stricke into the root of a tree, it killeth it: it is able to pierce a good cuirace, or iacke of buffe, or such like, as if it were an arrow shot or a dart lanced: but besides the force and power that it hath that way answerable to yron & Steele, the wound that it maketh is therewith poisoned. K

CHAP. XLIX.

¶ Of Fishes diseases.

We do not heare or reade, that all sorts of fishes in generall be subiect to maladies and diseases, as other beasts, and euen those that are wilde and sauage. But that this or that fish in euery kinde may be sicke, it appeareth evidently, that some of them mislike and come to be carrion leane, whereas others of the same sort, be taken, not only in good plight, but exceeding fat. L

CHAP. L.

¶ The wonderfull manner of their generation.

In what sort fishes do engender, if I should not in this place shew, but put it off farther, I should do great wrong to mankind, who desire to know it, as much as they wonder how it should be. In one word, fishes ingender by the friction and rubbing of their bellies one against another: which they performe with such celeritie, that no eye is so quicke as to note and obserue it. Dolphins, and other great whales, haue no other way but that, many they are longer somewhat about their businesse. The spawner, when the time serueth for generation, followeth after the male, and neuer linneth pecking and iobbing at his belly with her muzzle. Semblably a little before spawning time, the milters follow after the female, only for that they would eat their spawn when they haue cast it. But this is to be noted moreover, that the foresaid mixture & ingendering of theirs is not sufficient to accomplish generation, vnlesse when their eggs be laid or spawn cast, both male and female take it betwene them and keepe a turning of it, thereby to

A to breath a liuely spirit into it, and as it were besprinkle it with a vitall dew, as it floteth vpon the water. But turne they it and toss it, breath they vpon it as much as they will, yet all those little eggs of their spawn do not hit and come to prooffe: for if they did, all seas and lakes, and all riuers and pools would be so pestered full with fishes, that a man would see nothing els: for there is not one of these females, but at once conceiue an infinite number in her belly.

CHAP. LI.

¶ More as touching the generation of fishes, and which they be that do spawn in manner of egges.

THe spawn or eggs of Fishes in the sea, do grow vnto perfection, some of them exceeding soon, as that of the Lampreies: others are later ere they do so. All flat and broad Fishes, such namely as haue no tails and sharp pricks to hinder (as haue the Thorn-backe, Skare, and Tortoises) when they engender, leap one another. The many foot Pour-cuttes in this action fasten one of their winding clawes to the nose of the female. The Cuttels and Calamaries do the feat with their tongues or pipes rather thrust into their mouthes, clasping one another with their arms, and swimming one contrary to the other: and as they conceiue at the mouth, so they deliuer their fruit again at the mouth. This onely is the difference, that the she Calamaries in this businesse, beare their heads downward to the earth. As for those that are soft cruisted, they do it backward as dogs. Thus the Lobsters & Shrimpes ingender. Crabs at the mouth. Frogs leap one another: the male with the fore-feet clasps the arm-pits of the female, and with the hind-feet the hanches. That which is ingendered and brought forth, is as it were some little mites of blackish Hesh, which they call Tadpoles or Polwigs, shewing no good form, but that they haue some shew of eies only, and a taile. Some few daies after, their feet are framed, & then parts their taile in twain, which serueth for their feet behind. And a strange thing it is of them: after they haue liued some 6 months, they resolu into a slime or mud, no man seeth how: & afterward with the first rains in the Spring, retorne again to their former state, as they were first shapen, no man know as after what sort, by a secret and vnknown way incomprehensible: notwithstanding it falls out ordinarily to euery yere. As for the Limpins, Muskles, and Scallops, they breed of themselves in the mud and sands of the sea. Those which are of an harder coat, as the Pourcelanes and Purples, of a certain viscus and slimy substance like a muscilage. As for that little fry, resembling small gnats and flies of the sea, they come of a certaine putrifaction and sowerneesse of the water: as the Apua, which are the groundlings and Smies, of the some of the sea set in an heat & chafed after some good shewer. They that are couered with a stony shell, as Oysters, breed of the rotten and putrified slime & mud of the sea: or of the some that hath stood long about ships or stakes and posts set fast in the water, and especially if they bee of Holme wood. Howbeit, it hath bin found of late in Oyster pits, that there passeth from them in stead of Sperm a certain whitish humor like milk. As for Yeels they rub themselves against rocks and stones, and those scrapings (as it were) which are fretted from them, in time come to take life and proue snigs, and no other generation haue they. Fishes of diuers kinds engender not one with another, vnlesse it be the Skate and the Raifish: and of them there commeth a fish, which in the forepart resembleth a Ray, & in Greek hath a name compounded of both [Rhinobaros.] Other fishes there be that breed indifferently on land and sea, according to the warme season of the yere. In Spring time Scallops, Snailles, and Horsleeches do engender, and by the same warmth quicken and come to life, but in Autumne they turn to nothing. The Pike & Sardane breed twice a yere, like as al stone fish: the Barbels thrice, as also a kind of Turbit called Chalcis [r. the Shad:] the Carp 6 times: the Scorpenes and Sargi twice, namely, in Spring and Autumne. Of flat broad Fishes, the Skate only twice in the yere, to wit, in Autumne, and at the setting or occultation of the star *Vergilia*. The greatest number of Fishes ingender for 3 moneths, April, May, & Iune. The Cods or Stockfishes in Autumne. The Sargi, Crampfishes, & Squall about the equinoctiall. Soft skinned Fishes in the spring: and the Cuttel in euery month. The spawn of this Fish, which hangeth together like a cluster of grapes, by the means of a certaine blacke glew or viscositie like inke, the Milter doth blow and breath vpon before it can bee good, for otherwise it commeth to no prooffe. The Pour-cuttes engender in Winter, and in the Spring, and then bring forth a spawn crisped and curled (as it were) like the wreathing

A a

bran-

branches and tendrils of a vine branch; and that in such plenty, that when they are killed they are not able to receive and containe the multitude of their eggs in the concauitie or ventricle of their head and belly, which they bare when they were great. They hatch them in fifty daies, but many of them proue addle and neuer come to good, there is such a number of them. The Lobsters and the rest with thin shels, lay egges after egges, and sit vpon them in that manner. The female Pourcuttle, one while sitteth ouer her eggs, another while she couereth the cranie or gutter where she hath laid them, with her clawes and arms enfolded crosse one ouer another lattise wise. The Cuttle laith also vpon the dry land among the reeds, or els wherefoeuer she can find any sea-weeds or reits to grow, & by the 15 day hatcheth. The Calamaris lay eggs in the deep, which hang close and thick together, as the Cuttles do. The Purples, Burrets, and such like, do lay in the Spring. The sea Vrchins are with egges euery full moone in the winter time: and the winkles or cocles are bred in the winter likewise. The Crampfish is found to haue 80 young at once within her, and hatcheth her tender and soft eggs within her bodie, shifting them from one place of the wombe to another. In like manner do all they which are called Cartilagineus, or gristly. By which it commeth to passe, that fish alone both conceiue with egges, and yet bring forth a liuing creature. The male sheath-fish or riuer-whale *Silurus*, of all others only is so kind as to keep and looke to the eggs of the female after they be laid, many times for fifty daies after, for feare they should be deuoured of others. Other females hatch in three daies, if the male touch them. The Horne-beaks or Needle-fishes *Belona*, are the only fishes which haue within them so great eggs that their wombe cleaueth and openeth when they should lay them: but after that they be discharged of them, it groweth together and vnitheth againe. A thing vsuall (as they say) in Blind-wormes. The fish called *Mus-Marinus*, diggeth a gutter or ditch within the ground, and there laith her eggs, and the same she couereth ouer with earth, and so lets them alone for 30 daies, then she commeth and openeth the place again, findeth her eggs hatched, and leadeh her little ones to the water.

CHAP. LII.

¶ Of fishes wombes.

THe shel-fishes *Erythini* & *Chana*, haue their wombs or matrices. As for that fish which in Greeke is called *Trochos* [i. the top] is thought to get it selfe with yong. The frie of all water creatures, at the first see not.

CHAP. LIII.

Of the exceeding long life of fishes.

IT is not long since that we heard of one fishes memorable example, which proued the long life of fishes. There is a faire house of retreat and pleasure called *Pausilupum*, in Campaine not far from Naples, where (as *Anneus Seneca* writeth) there died a fish in the fish-pooles of *Cesar*, 60 yeres after that it had bin put in by *Pollio Vadius*: and there remained two more of that age and of the same kind, which liued still. And since wee are come to make mention of fish-ponds, me thinks I should do well to write somewhat more thereof, before I giue ouer this discourse of fishes and water creatures.

CHAP. LIIV.

¶ Of oyster pits, and who first deuised them.

THe first that inuented stewes and pits to keep oysters in, was *Sergius Orata*, who made such about his house in Baianum, in the daies of *L. Crassus* that famous orator, before the Mar-
fians war. And this the man did not for his belly and to maintain gourmandise, but of a
couetous mind for very gain. And by this and such wittie deuises, he gathered great reuenues:
for he it was that inuented the hanging baines and pooles to bathe in aloft vpon the top of an
house: and thus when he had set out his manour house for the better sale, he would make good
merchandise of them, and sell them againe for commoditie and gaine. He was the first man that
brought the *Lucrine Oysters* into name and credit for their excellent taste. For so it is,
that

A that the same kinds of fishes, in one place are better than in another. As the Pikes in the riuer *Tiberis*, which are taken between the two bridges: the *Turbot* of *Rauenna*: the *Lamprey* in *Sicilie*: the *Elops* at *Rhodes*, and so forth of other sorts of fishes: for I do not meane here to make a bill of all the dainty fish to serue the kitchin. There was no talk then of English oysters, when *Orata* brought those of the *Lucrine lake* into request, for as yet the Brittain coasts were not ours, which indeed haue the best oysters of all other. But afterwards it was thought it would quit the cost and pay for the pains, to fetch oysters from the furthest part of Italy, euen as far as *Brundisium*. And because there should grow no quarrell, nor controuersie arise, whether these or the former had the more delicate and pleasant taste, it was of late deuised that the hungrie oysters (which in the long cariage from *Brundisium* were almost famished) should be fed with the rest in the *Lucrine Lake*, and so taste alike. In those very daies, but somewhat before *Orata*, *Licinius Murena* deuised pools and stews for to keep and feed other fishes: whose example noblemen followed and did the like after them, namely, *Philip* and *Hortensius Lucullus* cut through a mountain neere vnto *Naples* for this purpose, namely, to let in an arm of the sea into his fish pooles: the doing whereof cost him more money, than the house it selfe which he there had built. Hereupon *Pompey* the great gaue him the name of Roman *Xerxes*, in his long robe. The fishes of that poole of his, after his death, were sold for thirty hundred thousand *Sesterces*, i. three millions of *Sesterces*.

CHAP. LV.

¶ Who inuented the stewes for Lampreys.

Caius *Hirtius* was the man by himselfe, that before all others deuised a pond to keep *Lampreys* in. He it was that lent *Cesar* Dictator for to furnish his feasts and great suppers during the time of his triumph, 600 *Lampreys*, to be paid againe by weight and tale in the same kind: for fel them he would not right out for any money, nor exchange them for other commodities. A house he had for his pleasure in the country, and but a very little one, yet the ponds and fishes about it sold the house for foure millions of *Sesterces*. In processe of time folk grew to haue a loue and cast a fancy to some one feuerall fish about the rest. For the excellent *Orator Hortensius* had an house at *Bauli*, vpon the side that lieth to *Bair*, & a fish-pond to it belonging: and he took such an affection to one *Lamprey* in that poole, that when it was dead (by report) he could not hold but weep for loue of it. Within the same poole belonging to the said house, *Antonia* the wife of *Drusus* (vnto whom they fell by inheritance) had so great a liking to another *Lamprey*, that she could find in heart to decke it, and to hang a paire of golden earrings about the guils thereof. And surely for the nouelty of this strange sight, and the name that went thereof, many folke had a desire to see *Bauli*, and for nothing els.

CHAP. LVI.

¶ The stewes of Winkles, and who first was the deuiser.

Elvius *Hirpinus* was the first inuenter of warrens as it were for Winkles, which he caused to be made within the territory of *Tarquini*, a little before the ciuil war with *Pompey* the great. And those had their distinct partitions, for sundry sorts of them: that the white, which came from the parts about *Reate*, should be kept apart by themselves: the *Illyrian* (and those were chiefe for greatnesse) alone by their selues: the *Africans* (which were most fruitfull) in one feuerall: and the *Solitanes* (simply the best of all the rest) in another. Nay more than that, he had a deuise in his head to feed them far, namely, with a certain paste made of cuit & wheat meale, and many other such like: to the end forsooth, that the gluttons table might be serued plentifully with home-fed & franked great Winkles also. And in time, men grew to take such a pride and glory in this artificial feat, and namely, in striuing who should haue the biggest, that in the end one of their shels ordinarily would containe * 80 measures called *Quadrants*, if *M. Farro* say true, who is mine Author.

Aa 2

CHAP.

* 3 wine gallons and three quarters: for *Quadrans* is 3 *Cyathi*, i. the 4 part of *Sextarius*, & *Sextarius* is a wine pint & a halfe, or 18 cupes.

CHAP. LVII.

¶ Of Land-fishes.

Theophrastus also telleth strange wonders of certain kinds of fishes, which are about Babylon, where there be many places subject to the inundations of Euphrates and other riuers, and wherein the water standeth, after that the riuers are returned within their bankes: in which the fish remain in certain holes & caues. Some of them, saith he, vse to issue forth aland for food and releeve, going vpon their fins in lieu of feet, and wagging their tailes euer as they go. And if any chase them, or come to take them, they will retire back into their ditches afore-said, and there make head and stand against them. They are headed like to the * sea Frog, made in other parts as Gudgeons, and guilled in manner of other fishes. Moreouer, that about Heraclea and Cromna, and namely neere the riuier Lycus, & in many other quarters of the kingdom of Pontus, there is one kind about the rest that euer haunteth riuers sides, and the vtmost edges of the water: making her selfe holes vnder the banks, and within the land wherin she liueth, yea, euen when the banks are drie, and the riuers gathered into narrow channels. By reason whereof they are digged forth of the earth: and as they say that find them, alieue they be, as may appeare by mouing and stirring of their bodies. Neere vnto the abovesaid Heraclea & the riuier Lycus, when it is false and the water ebbe, there be fishes breed of the egges and spawne left vpon the mud and sand, who in seeking for their food, do stir and pant with their little guills: which they vse to do when they want no water, but euen then when as the riuier is full. Which is the reason also that yeeles liue a long time after they be taken forth of the water. He affirmeth moreouer, that the eggs of fishes lying vpon the dry land, will come to their maturity and perfection, and namely those of the Tortoises. Also, that in the same country of Pontus, there be taken fishes vpon the yce, and gudgeons especially, which shew not that they be alieue, but by their stirring and leaping when they come to be foddren in hot caudrons. Hereof may some reason yet be rendered, although the thing be strange and wonderful. The same author auoucheth, that in Paphlagonia there be digged out of the ground certaine land fishes that be excellent good meat, and most delicate: but they be found in dry places remote from the riuier, & whither no waters flow, wherby they are forced to make the deeper trenches for to come by them. Himselfe maurelleth how they should engender without the help of moisture. Howbeit, hee supposeth that there is a certain minerall and naturall force therein, such as we see to sweat out in pits, forasmuch as diuers of them haue fishes found within them. Whatsoeuer it is, surely lesse wonderfull this is, considering how the Moldwarps liue (a creature naturally keeping vnder the ground) vnlesse haply we would say that fishes were of the same nature that earth wormes be of.

CHAP. LVIII.

¶ Of the mice of Nilus:

But the inundation of Nilus cleareth all these matters: the ouerflowing whereof is so admirable, and so far passeth all other wonders, that we may well beleue these things. For when as this riuier falleth and returneth againe into his channell, a man may find vpon the mud yong Mice halfe made, proceeding from the generatiue vertue of water and earth together: hauing one part of their body liuing already, but the rest as yet mishapen, and no better than the very earth.

CHAP. LIX.

¶ Of the fish Anthias, and how he is taken.

I thinke it not meet to conceale that, which I perceiue many do beleue & hold, as touching the fish Anthias. We haue in our Cosmographie made mention of the Isles Chelidonix in Asia, situate in a sea full of rocks vnder the promontory of Taurus, among which are found great store of these fishes: and much fishing there is for them, but they are suddenly taken, and euer after one sort. For when the time serueth, there goeth forth a fisher in a smal boat or barge for certain daies together, a pretty way into the sea, clad alwaies in apparel of one and the same colour, at one houre, and to the same place stil, where he casteth forth a bait for the fish: but the fish

- A** fish Anthias is so craftie and warie, that whatsoeuer is thrown forth, he suspecteth it euer more, that it is a means to surprise him. He feareth therefore and distrusteth: and as he feareth, so is he as warie: vntill at length, after much practise & often vsing this deuise of flinging meat into one place, one about the rest groweth so hardy and bold, as to bite at it, for now by this time he is grown acquainted with the maner thereof, and secure. The fisher takes good mark of this one fish, making sure reckoning that he wil bring more thither, and be the means that he shall spee'd his hand in the end. And that is no hard matter for him to do, because for certain daies together, that fish, & none but he, dare aduenture to come alone vnto the bait. At length this hardy captaine meets with some other companions, and by little & little he commeth euery day better accompanied than other, vntill in the end he brings with him infinite troupes and squadrons together, so as now the eldest of them all (as crafty as they be) be so well vsed to know the fisher, that they will snatch meat out of his hands. Then hee espying his time, putteth forth an hook with the bait, somewhat beyond his fingers ends, flieth and seizeth vpon them more truly, then catcheth them, and speedily with a quick & nimble hand whippes them out of the water within the shadow of the ship, for feare least the rest should perceiue, & giueth them one after another to his companion within; who euer as they be snatcht vp, larcheth them in a course twillie or covering, & keeps them sure enough from struggling or squeaking, that they should not driue the rest away. The speciall thing that helpeth this game and pretty sport, is to know the captain from the rest, who brought his fellows to this feast, & to take heed in any hand that he be not twitcht vp and caught. And therefore the fisher spareth him, that he may flie and goe to some other flock for to train them to the like banquet. Thus you see the maner of fishing for these Anthæ. Now it is reported moreouer, that one fisher vpon a time (of spitefull minde to do his fellow a shrewd turn) laid wait for the said captain fish, the leader of the rest (for he was very wel known from all others) and so caught him: but when the foresaid fisher espied him in the market to be sold, and knew it was betaking himselfe misused & wronged, brought his action of the case against the other, and sued him for the dammage, and in the end condemned him. Mutianus saith moreouer, That the plaintife was awarded to haue for recompence, 10 pounds of the defendant. The same fishes, if they chance to see one of their fellows caught with an hook, by report, with their sharp fins which they haue vpon their backe like sawes, cut the line in two: for he that hangeth at it, will of purpose stretch it out streight, that it may be cut asunder more easily. But the Sargots haue another trick for that: for he that finds himselfe taken, fretteth the line in twaine, whereto the hooke hangeth, against a hard rocke.

CHAP. LX.

¶ Of the Sea fishes called Starres.

- O**ver and besides all these, I see that some deep clerks and great Philosophers haue made a wonder at the Star in the sea. And verily it is no other than a very little fish, made like a star (as we see it painted.) A soft flesh it hath within: but without forth an hard brawnie skin. Men say it is so fierie hot, that whatsoeuer it toucheth in the sea, it burneth: and look what meat it receiue, it makes a hand with it, & digesteth it presently. What prooffe there is hereof, and how men should come to the knowledge and experience of thus much, I cannot readily set downe. I would thinke that rather more memorable and worthy to be recorded, whereof we haue daily experience.

CHAP. XLI.

¶ Of the Dactyli, and their wonderfull qualities:

- O**f the shell fish kind are the Dactyli, so called of the likenesse of mens nailes, which they resemble. The nature of this fish is to shine by themselves in the darke night, when all other light is taken away. The more moisture they haue within them, the more light they giue: in so much as they shine in mens mouths as they be chawing of them: they shine in their hands: vpon the floore on their garments, if any drops of their fattie liquor chance to fall by: so as it appeareth, that doubtlesse it is the very iuice & humor of the fish which is of that nature, which we do so wonder at in the whole body.

¶ Of the enmitie and amitie which is between fishes and other water beasts.

Such concord there is in some, and such discord in others, as is wonderfull. The Mullet and the sea-Pike hate one another, and be euer at deadly war: likewise the Congre & the Lamprey: inso much as they gnaw off one anothers taile. The Lobster is so afraid of the Polype or Pourcuttell, that if he spie him neere, he euermore dieth for very woe. The Lobsters are ready to scratch and teare the * Congre: the Congre againe do as much for the Polype. *Nigidius* writeth, That the sea-Pike biteth off the Mullers taile: and yet the same fishes in certaine set moneths are good friends, and agree well enough. He saith moreover, that those Mullers liue all, notwithstanding their tails be so cutt off. On the other side, there be examples of friendship among fishes, besides those, of whose societie and fellowship I haue already written: and namely, between the great whale *Balæna*, and the little *Musculus*. For whereas the Whale aforesaid hath no vse of his eyes (by reason of the heauy weight of his cie-browes that couer them) the other swimmeth before him, serueth him in stead of eyes and lights, to shew when he is neere the shelues and shallowes, wherein he may be soone grounded, so big and huge he is. Thus much of fish. Hence forward will we write of Foules.

* Locuste Congrum, ex Arist. lib. 8. c. 2. b. i. f. or animal.

THE TENTH BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

¶ The nature of Birds and Foules.

It followeth now that we should discourse of the nature of Foules. And first to begin with Ostriches. They are the greatest of all other foules, and in manner of the nature of foure footed beasts: (namely, those in Africke and Æthiopia) for higher they be than a man sitting on horsebacke is from the ground: and as they be taller than the man, so are they swifter on foot than the very horse: for to this end only hath Nature giuen them wings, euen to help and set them forward in their running: for otherwise, neither flie they in the aire, ne yet so much as rise & mount from the ground. Clouen houfs they haue like red deere, and with them they fight; for good they be to catch vp stones withall, & with their legs they whurle them back as they run away, against those that chase them. A wonder this is in their nature, that whatsoeuer they eat (and great deuourers they be of all things, without difference and choise) they concoct and digest it. But the veriest fooles they be of all others. For as high as the rest of their body is, yet if they thrust their head and necke once into any shrub or bush, and get it hidden, they thinke then they are safe enough, and that no man seeth them. Now two things they doe affoord, in recompence of mens pains that they take in hunting and chasing them: to wit, their eggs, which are so big, that some vse them for vessels in the house: and their feathers so faire, that they serue for pennaches to adorne and set out their crests and morions of souldiers in the wars.

CHAP.

¶ Of the Phoenix.

The birds of Æthiopia and India, are for the most part of diuerse colours, and such as a man is hardly able to decipher and describe, But the Phoenix of Arabia passes all others. Howbeit, I cannot tell what to make of him: and first of all, whether it be a tale or no, that there is neuer but one of them in all the world, & the same not commonly seen. By report he is as big as an Ægle: for colour, as yellow and bright as gold, (namely all about the necke,) the rest of the bodie a deep red purple: the taile azure blew, intermingled with feathers among of rose carnation color: and the head brauely adorned with a crest and penach finely wrought; hauing a tuft and plume thereupon, right faire and goodly to be seen. *Manilius*, the noble Roman Senatur, right excellently scene in the best kind of learning and litterature, and yet neuer taught by any, was the first man of the long Robe, who wrot of this bird at large, & most exquisitely. He reporteth, that neuer man was known to see him feeding: that in Arabia he is held a sacred bird, dedicated vnto the Sun: that he liueth 660 yeares: and when he groweth old, and begins to decay, he builds himselfe with the twigs and branches of the Canell or Cinamon, and Frankincense trees: and when he hath filled it with all sort of sweet Aromaticall spices, yeeldeth vp his life thereupon. He saith moreover, that of his bones and marrow there breeds at first as it were a little worme: which afterwards proueth to be a prettie bird. And the first thing that this yong new Phoenix doth, is to perform the obsequies of the former Phoenix late deceased: to translate and cary away his whole nest into the citie of the Sun neere Panchæa, and to bestow it full deuoutly there vpon the altar. The same *Manilius* affirmeth, that the reuolution of the great yeare so much spoken of, agreeth just with the life of this bird: in which yeare the stars returne againe to their first points, and giue significations of times and seasons, as at the beginning and withall, that this yeare should begin at high noone that very day when the Sun entrench the signe *Aries*. And by his saying, the yeare of that reuolution was by him shewed; when *P. Licinius* and *M. Cornelius* were consuls, *Cornelius Valerianus* writeth, That whiles *Q. Plautius* and *Sex. Papinius* were Consuls, the Phoenix flew into Ægypt. Brought he was hither also to Rome in the time that *Claudius Caesar* was Censor, to wit, in the eight hundredth yeare from the foundation of Rome: and shewed openly to be seen in a full hall and generall assembly of the people, as appeareth vpon the publick records: howbeit, no man euer made any doubt, but he was a counterfeit Phoenix, and no better.

¶ Of Ægles.

Ofall the birds which we know, the Ægles carie the price both for honor & strength. Six kinds there be of them. The first named of the Greeks * *Melanaetos*, and in Latin, *Valeria*: the least it is of all others, and strongest withall, blacke also of colour: In all the whole race of the Ægles, she alone nourisheth her yong birds: for the rest (as we shall hereafter declare) doe beat them away: she only crieth not, nor keepeth a grumbling and huzzing as others doe: and euermore converseth vpon the mountaines. Of the second sort is * *Pygæus*. It keeps about townes and plaines, and hath a whitish taile. The third is *Morphnos*, which *Homer* calls also *Perchor*: some name it *Plancus* and * *Anataria*: and she is for bignesse and strength, of a second degree: louing to liue about lakes and meeres. Ladie *Phæmona*, who was supposed & said to be the daughter of *Apollo*, hath reported, that this Ægle is toothed: otherwise mute, as not hauing any tongue: also, that of all other she is the blackest, and hath the longest tail. With her accordeth *Boethus* likewise. Subtle she is and wittie: for when she hath seized vpon Tortoises and caught them vp with her talions, she throweth them downe from aloft to breake their shells. And it was the fortune of the Poet *Æschylus* to die by such a meanes. For when he was foretold by wizards out of their learning, that it was his destinie to die on such a day by some thing falling on his head: he thinking to preuent that, got him forth that day into a great open plain, far from house or tree, presuming vpon the securitie of the cleare and open skie. Howbeit, an Ægle let fall a Tortoise, which light on his head, dasht out his braines, and laid him asleepe for euer.

* The Saker as some thinke.

* A kind of Falcon.

For k. King of Dukies and Mallards.

Of

*The mountain Stork.

Of the fourth kind is *Pernopterus*, the same that **Oripelargus*, fashioned like to a Geire or Vulture: it hath least wings, a bodie bigger than the rest: but a very coward, fearfull & of a bastard and crauen kind, for a rauen will beat her. Besides, she hath a greedie and hungrie worm alwaies in her georg and craw, and neuer is content, but whining and grumbling. Of all Eagles the only carrieth away with her the dead prey, & feedes thereupon in the aire: whereas others haue no sooner killed, but they prey ouer them in the place. This bastard buzzard kind maketh that the fifth, (which is the roiall Eagle) & is called in Greek *Gnesios*, as one would say, true and kindly, as descended from the gentle and right aire of Eagles. This Eagle roiall, is of a middle bignesse and of a reddish colour, a rare bird to be seene. There remaineth now the sixt and last sort, and that is **Haliartus*. This Eagle hath the quickest and clearest eie of all other, soaring & mounting on high: when she spieth a fish in the sea, downe she comes with a power, plungeth into the water, and breaking the force thereof with her brest, quickly she catcheth vp the fish, and is gone. That Eagle which we named in the third place, haunting lakes, fens, and standing waters for to prey vpon water-foule, who, to shift from her, are driuen otherwhile to diue vnder the water: but she presseth so hard vpon them, that they be wearied and astonied in the end, and then she catcheth them vp and carrieth them away. A worthy sport it is to see the maner of their scuffling: whiles the silly riuier bird makes means to gain the bank side for refuge (especially if it be well grown with reeds) and the Eagle for her part driues her from thence with the clap and stroke of the wing, whiles, I say, as the Eagle striketh, and therewith plungeth her selfe down into the water, the poore fowle that swims vnderneath, seeing the shadow of the Eagle houering about the bank side, riseth vp again in another place far enough off from the Eagle, and where she imagined she should be least looked for. Which is the cause that these wild fowle in the water commonly swim in flocks. For when they are many together they are not much troubled and annoied, by reason that with fluttering their pinnions, with dashing and flapping the water with their wings, they dazle the sight of their enemy. Oftentimes also the very Eagles, not able to weld the prey that they haue seised on, are together with it drawne vnder the water, & so drowned. Now as touching the *Haliartus*, or the Osprey, she only before her little ones be feathered, will beat and strike them with her wings, and thereby force them to looke full against the sun beames: now if she see any one of them to winke, or their eies to water at the raies of the Sun, she turns it with the head forward out of the nest, as a bastard, and not right, nor none of hers; but bringeth vp and cherisheth that whose eye will abide the light of the Sun, as she looks directly vpon him. Moreover, these Orfraies or Ospreies are not thought to be a feuerall kind of Eagles by themselves, but to be mungrels, and ingendred of diuers sorts. And their young Orfraies be counted a kind of Ossifragi: from them come the lesser Geires; they again breed the greater, which ingender not at all. Some reckon yet another kind of Eagle, which they call *Barbatæ*; and the Tuscanes, *Ossifrage*.

*The pretious stone Aetites.

But of the six kinds before rehearsed, the 3 first, and the fift, haue in their nest a stone found named **Aetites*, which some call *Gagates*, and it is therein ingendred. This stone is medicinal, and singular good for many diseases, and if it be put into the fire it will neuer a whit consume. Now this stone, as they say, is also with child: for if a man shake it, he shall heare another to rattle and sound within, as it were in the belly or wombe of it. But that vertue medicinable abouesaid is not in these stones, if they be not gotten out of the very nest from the aire. For while they do and make their nests vpon rocks and trees. Three eggs commonly they lay, whereof two only they vse to hatch: howbeit sometimes they haue bin seen to haue 3 yong ones. But lightly one of them they turn out of the nest, because they would not be troubled with feeding & nourishing it. And verily Nature hath wel provided, that at such a time the old Eagles should not be able to puruey sufficient for meat: for otherwise, if they should reare their birds, they were enough to destroy the yong breed of deere & wild beasts in a whole country, that there should be no venison nor game at all for gentlemen. Moreover, by the same providence of Nature, all that while their tallons or clees hooke and turne inward very much: also for very hunger their feathers wax gray & white, so as they haue good cause not to abide their yong. But when they haue cast them off, the Ossifrages which are neere of kin vnto them, are ready to take them and bring them vp with their own birds. But the old Eagles their dammes not content therewith, persecute them still when they are growne to be bigge ones, beating and chasing them away farre off, as their very concurrents, and who would intercommune with them, and rob them of their

- A their prey. And were it not so, certainly one aire of Eagles needs the reach of a whole country to furnish them with venison sufficient to their tull. They haue therefore their feuerall coasts and walks, and without those limits and vsuall haunts they rauen not. When they haue seised of any prey, they carry it not away presently, but first lay it downe, peruse and peise the weight of it, and then away they fly therewith amaine, but not before. They die not for age, nor vpon any sicknesse, but of very famine, by reason that the vpper beake of their bil is so far ouergrown and turns inward so much, that they are not able to open it to feed themselves. Their maner is ordinarily to go to their busines (namely to fly and seek their prey) after noon: for all the forenoon they are perched vp, doing nothing, waiting the time when men be not stirring abroad, but about their markers within the cities and townes, or otherwise busie in their ciuil affaires. The quils or feathers of Eagles laid among those of other fowles, will deuour & consume them.
- B Men say, that of all flying Fowle the Eagle only is not smitten nor killed with lightning: whereupon folke are wont to say, that shee serues *Iupiter* in place of his squire or armor-bearer.

CHAP. IV.

¶ When Eagles began to be the Ensignes and standards of the Roman legions: and what fowles they be that war with Eagles.

- C *Aius Marius* in his second Consulship ordained, that the legions of Romane soldiers only should haue the Eagle for their standard, and no other ensigne: for before-time the Eagle marched formost indeed, but in a ranke of foure others, to wit, of **Wolues*, *Minotauras*, *Horses*, and *Bores*, which were borne each one before their own feuerall squadrons and companies. Not many yeares past, the standard of the Eagle alone began to be aduanced into the field to battell, and the rest of the ensignes were left behind in the campe: but *Marius* reiected them altogether, and had no vse of them at all. And euer since this is obserued ordinarily, that there was no standing campe or leaguer wintered at any time without a paire of Eagle standards.

* Names of Ensignes.

- D Of Eagles, the first and second kind prey not only vpon the lesse foure footed beasts, but also maintain battell with the red Deere, euen the stag and the hind. The maner of the Eagle is, after she hath wallowed in the dust, and gathered a deale thereof among her feathers, to settle vpon the horns of the Deere aforesaid, to shake the same off into his eies, to flap and beat him about the face with his wings, vntill she driue him among the rocks, and there force him to fall down from thence headlong, and so to breake his neck. Moreover, the Eagle hath not enough of this one enemy, but she must war with the dragon also; howbeit the fight betwene them is more sharp and eager, yea, and putteth her to much more danger, albeit otherwhiles they combat in the aire. The Dragon of a naturall spight and greedy desire to do mischief to the Eagle, watcheth euer more where the aire is, for to destroy the eggs, and so the race of the Eagles. The Eagle again wherefoeuer she can set an eye vpon him, catcheth him vp and carrieth him away: but the serpent with his taile windeth about his wings, and so intangleth and tieth them fast, that downe they fall both of them together.

CHAP. V.

E

¶ A strange and wonderfull accident of an Eagle.

- T Here hapned a marvellous example about the city *Sestos*, of an Eagle: for which in those parts there goes a great name of an Eagle, and highly is she honored there. A yong maid had brought vp a yong Eagle by hand: the Eagle again to requite her kindnes, would first when shee was but little, flie abroad a birding, and euer bring part of that shee had gotten vnto her said nurse. In processe of time, being grown bigger and stronger, would set vpon wild beasts also in the Forrest, and furnish her yong mistresse continually with store of venison. At length it fortuneed that the damosell died: and when her funerall fire was set a burning, the Eagle flew into the mids of it, and there was consumed into ashes with the corps of the said virgin. For which cause and in memoriall thereof, the inhabitants of *Sestos* and the parts there adioyning, erected in that very place a stately monument, such as they call *Heroum*, dedicated in the name of *Iupiter* and the virgin, for that the Eagle is a bird consecrated vnto that god.

CHAP.

CHAP. VI.

¶ Of Vultures or Geires.

THe blacke Vultures are the best of that kind. No man euer could meet with their nests : whereupon some haue thought, but vntruly, that they fly vnto vs out of another world, euen from the Antipodes, who are opposite vnto vs. But the very truth is, they build in the highest rocks they can find, and their yong ones haue many times bin seene, two together, and no more. *Vmbrius*, who was counted the most skilfull Aruspex of our age, saith, they vsually lay three eggs, whereof they take one of them to sacre and blesse (as it were) the other eggs and the nest, and then soon after they cast it away. Also that the maner of the Geires is to foresee a carnage, and to fly two or three daies before vnto the place where there wil be any carions or dead carcasses.

CHAP. VII.

¶ Of the Sangualis and Immussulus.

AS touching the Sangualis and the Immussulus, our Augurs at Rome are in a great doubt and make much question, what they should be. Some are of opinion, that the Immussulus is the chicke of the Vulture ; and the Sangualis likewise the yong Ossifraga. *Massurius* saith, that the Sangualis and Ossifraga be both one : and as for the Immussulus, it is the yong bird of the Eagle before it come to haue a white taile. Some haue affirmed confidently, that after the death of *Mutius* the Augure there was neuer any of them seen at Rome. But I rather am of this mind (and me thinkes it founds more like a truth) such is the supine negligence and carelesse of men in all things else, that no maruell it is if they know them not although they see them.

CHAP. VIII.

¶ Of Hawkes.

WE find in Faulconrie 16 kinds of Hawks or Fowles that prey. Of which the *Circos* (which is lame and limpeth of one leg) was held in antient time for the luckiest Augurie in case of weddings and of cattell. Also the Hawke called *Triorches* (of three stones or cullions that it hath) is reputed a bird of good presage : and in Augurie, lady *Phemio* hath giuen vnto it the honor of the best simply and most fortunate. The Romans call it *Buteo*, i. a Buzzard ; and there is a worshipfull house and family in Rome of that surname, by occasion that a Buzzard settled and perched himselfe vpon the Admirall ship where *Fabius* himselfe, one of that house, was, presaging a boone-voyage and happy successe, according as it fell out indeed. As for the Hawk which the Greeks name *Æsalo*, i. the Merlin, the alone is euer seen at all times of the yeare, whereas the rest are gon when winter commeth. In generall, Hawkes are diuided into sundry and distinct kinds, by their greedinesse more or lesse, and their manner in chase and preying : for some there be that neuer seise on a foule but vpon the ground : others againe neuer assaile any birds, but when they spy them flying about some tree. There be also, that take a bird perching and sitting on high : and ye shal haue of them that ouertake them as they fly in the wide and open aire. The doves therefore and pigeons, knowing the danger of flying aloft, so soon as they espy them, either light vpon the ground and settle, or else fly neere the earth, and thus help themselves by taking a contrarie course to the Hawks nature, to auoid their talons. There is in the ocean of Africke an Island called *Cerne*, wherem all the hawks of the coasts of the *Masseyli*, build vpon the very ground, and there breed, and be so accustomed to those countries, you shal not find an aire of them elsewhere. In a part of *Thrace*, somewhat higher in the country beyond *Amphipolis*, men and hawks ioyn in fellowship and catch birds together ; for the men driue the woods, beat the bushes and reeds to spring the fowle ; then the hawks flying ouer their heads, seise vpon them, and either strike or beat them to the ground fit for their hands. On the other side, the hawkers and fowlers when they haue caught the Fowle, diuide the booty with the hawks ; and by report they let such birds fly againe at libertie aloft into

A into the aire, and then are the hawkes ready to catch them for themselves. Moreouer, when the time is of hawking, they will by their manner of crie and flying together, giue signe to the faulconers that there is good game abroad, and so draw them forth to hawking for to take the opportunitee. It is said, that the wolues doe the like, about the lake *Mœotis* : for vnlesse they may haue their part with the fishers, they will rend and teare their nets, when they find them stretched forth. Faulcons or Hawkes willingly eat not the heart of any bird. There is an hawk called *Cymindis*, which preyeth in the night : seldome is she seene in the woods, and by day-light seeth little or nothing. There is deadly war between it and the *Ægle* ; and oftentimes they be both taken, entangled one with another.

CHAP. IX.

¶ Of the Cuckow, which vsually is killed by birds of her owne kind.

AS touching the Cuckow, it seemes that he comes of some hawk changed into his shape at one certaine time of the yeare : for then those other hawkes are not to be seene, vnlesse some very few daies. He sheweth himselfe also but for a small season in summer time, and afterwards appeareth no more. It is the only hawk that hath no talons hooked downward, neither is he headed as other hawkes, nor like vnto them, but in colour : and for bill, he resembleth rather the dove. Nay more than that, the hawk will prey vpon him and deuoure him, if haply they be seen both together : and it is the only bird of all other that is killed by those of the own kind. He altereth his voice also. In the spring, he commeth abroad, and by the beginning of the dog-daies, hides himselfe. These lay alwaies in other birds nests, and most of all in the Stock-doues, commonly one egge and no more (which no other bird doth besides) and seldom twain. The reason why they would haue other birds to sit vpon their eggs and hatch them, is because they know how all birds hate them : for euen the very little birds are readie to war with them : for feare therefore that the whole race of them should be vtterly be destroyed by the furie of others of the same kind, they make none of their owne (being otherwise timorous and fearefull naturally of themselves) and so are forced by this craftie shift to auoid the danger. The Titling therefore that sitteth, being thus deceiued, hatcheth the egge & bringeth vp the chick of another bird. And this yong Cuckow being greedy by kind, beguiling the other yong birds and intercepting the meat from them, groweth hereby fat and faire-looking : whereby it comes into speciall grace and fauour with the dam of the rest, and nource to it. She ioieth to see so goodly a bird toward : and wonders at her selfe that she hath hatched & reared so trim a chick. The rest, which are her owne indeed, she sets no store by, as if they were changelings : but in regard of that one, counteth them all bastards and misbegotten : yea, and suffereth them to be eaten and deuoured of the other euen before her face : and this she doth so long, vntill the yong cuckow being once fledge & readie to flie abroad, is so bold as to seize on the old Titling, and to eat her vp that hatched her. And by that time there is not another bird againe for goodnesse and sweetnesse of meat, comparable to the yong Cuckow.

CHAP. X.

¶ Of Gledes, Kites, or Puttocks.

THe Kites or Gledes are of the same kind of Hawkes or birds of prey, only they be greater. This hath been noted & obserued in them : that being a most rauenous bird, & euer more hungrie, yet were they neuer knowne to snatch any viands ordained at funerall feasts for the dead, out of the platters ; ne yet the flesh of beasts slaine in sacrifice, from off the altar of *Iupiter* in *Olympia*. Nay, it was neuer seen that a Puttocke would catch flesh out of their hands that serued at such feasts : but if it did, a great presage it was of some dolefull & heauie misfortune which should fall vpon the whole town, that made these solempne sacrifices. These Gledes or Puttocks, seem by the winding and turning of their tails to & fro as they flie, to haue taught pilots the skil of steering, and vse of the helme. See how Nature hath shewed that in the aire above, which is so necessary in the deep sea beneath ! Kites likewise are not often seen abroad in the dead time of winter : yet go they not away for altogether before the Swallows. Moreouer, it is said, that after the Sunsteds, alway in summer, they be troubled with the gout in their feet.

CHAP.

CHAP. XI.

¶ A generall diuision of Fowles.

THe first & principall difference and distinction in birds, is taken from their feet: for they haue either hooked tallons, as Hawkes; or round long claws, as Hennes; or else they be broad, flat, and whole-footed, as Geefe and all the sort in manner of water-foule. Those that haue hooked tallons, for the most part feed vpon flesh and nothing else.

CHAP. XII.

¶ Of vnluckie birds, and namely, the Crow, Raven, and Scritch-owle.

THe Crow liueth not altogether of carion, for the Rooke eateth of other food. The Crows and Rookes haue a cast by themselves: for when they meet with an hard nut which they be not able to cracke, nor breake their shales with their bills, they will flie aloft and fling it against some rock or tile house once or twice, yea & many times together, till it be so crushed and bruised, that they may easily breake it quite, and then they eat vp the kernell. These birds all of them keep much prating and are full of chat; which most men take for an vnluckie sign and presage of ill fortune: although some there be who think otherwise, that it is a good bird, and highly esteem of her. Obserued it is, that from the going down or occultation of the starre Arcturus, vnto the coming of the Swallow, the Crow is not to be scene else where but about the groues and temples of *Minerva* (and that is but very seldome) and namely, neere to Athens. Moreover, this bird only feedeth her yong cadowes for a good while after they are able to flie. She is most vnluckie at breeding time and couing, that is to say, after the Sunsted in summer. All other birds, which be as it were of the same race, driue their yong ones out of the nest when they be once fled, and put them to it, forcing them to flie abroad: like as the *Rauens* also, who likewise feed not on flesh only: and they likewise when they perceiue their yong, once to be strong, chase and driue them away farre off. Therefore about little villages and hamlets, there commonly be not about two paire of them at once. And about *Cranon* verily in *Thessalie*, yee shall neuer see about one paire of them: for the old ones giue place to the yong, and fly away. There are some diuers and different properties in this bird, and that before-named: for the *Rauens* engender before the Sunsted, and for sixtie daies are somewhat ill at ease, and troubled with a kind of drought or thirstiness especially, till such time as the figges be ripe in Autumne: and then from that time forward, the Crow beginneth to be diseased and sick. *Rauens* for the most part lay five egges: and the common sort are of opinion, that they conceiue and engender at the bill, or lay their egges by it: and therefore if women great with child chance to eat a *Rauens* egge, they shall be deliuered of their children at the mouth: and generally shall haue hard labour, if such an egge be but brought into the house where such a great bellied woman be. *Aristotle* denies this, and saith, that the *Rauens* conceiue by the mouth, no more than the *Egyptian Ibis*: and he affirmeth, that it is nothing else but a wantonneffe which they haue in billing and kissing one another, which we see them to doe oftentimes, like as the *Doues* and *Pigeons* also. The *Rauens* of all other fowles, seeme to haue a knowledge of their owne significations in presages and fore-tokens: for when the mercinarie hired souldiers of *Media* were all massacred vnder a colour of entertainment and hospitalitie, the *Rauens* flew all away out of *Peloponnesus* and the region of *Attica*. The worst token of ill lucke that they giue, is when in their crying they seeme to swallow in their voice as though they were choked.

The night birds haue also crooked tallons, as the *Owles*, *Scritch-Owle*, & *Howlers*. All these see but badly in the day time. The *Scritch-Owle* alwaies betokeneth some heauie newes and is most execrable and accursed, and namely, in the presages of publick affaires: he keepeth euer in desarts: and loueth not only such vnpeopled places, but also that are horrible and hard of access. In summe, he is the very monster of the night, neither crying nor singing out cleare, but uttering a certaine heauy groane of dolefull mourning. And therefore if he be seen to fly either within cities, or otherwise abroad in any place, it is not for good, but prognosticates some fearful misfortune. Howbeit I my selfe know, that he hath sitten vpon many houses of priuat men, and

A and yet no deadly accident followed thereupon. He neuer flieth directly at ease, as hee would himselfe, but euermore sidelong or byas, as if he were carried away with the wind or somewhat else. There fortun'd one of them to enter the very secret sanctuarie within the *Capitol* at Rome, in that yeare when *Sex. Papellio Ister*, and *L. Pedanius* were Consuls: whereupon at the Nones of March, the city of Rome that yeare made generall processions to appease the wrath of the gods, and was solemnly purged by sacrifices.

CHAP. XIII.

¶ Of the bird Incendiaria.

BHis fire-bird *Incendiaria* is likewise vnlucky, and as our *Chronicles* and *Annals* doe witness, in regard of her the city of Rome many a time hath made solemne supplications to pacifie the gods, and to avert their displeasure by her portended. As for example, when *L. Cassius* and *C. Marius* were Consuls: in that very yeare when by occasion of a *Scritch-Owle* scene, the city likewise was purged by sacrifice, as is aboue said, and the people fell to their prayers & deuotions. But what bird this should be, neither do I know, nor yet finde in any writer. Some giue this interpretation of *Incendiaria*, to be any bird whatsoever, which hath bene scene carying fire either from altar or chappell of the gods. Others call this bird *Spinturnix*. But hitherto I haue not found any man that would say directly, That hee knew what bird this should be.

CHAP. XIV.

¶ Of the bird Cluina or Cluina.

Likewise the bird named in old time *Clivina*, or *Cluina*, which some call *Clamatoria*, and which *Labes* describeth by the name of *Prohibitoria*, I see is as little known as the other. *Nigidius* also maketh mention of a bird called *Subis*, which vseth to squash Egles eggs.

CHAP. XV.

¶ Of other unknowne Birds.

IN the *Augures* bookes which the *Tuscanes* haue composed, there be many birds described and set out in their colours, which haue not been scene some hundreds of yeares past. And I muse and maruell much, that they should be now extinct, and the race of them cleane gone, considering that the kind of those fowles is not lost, but continueth still in great abundance, which men eat daily at their tables, and consume so ordinarily.

CHAP. XVI.

¶ Of night-flying Birds.

OF strangers and forrein writers, *Hylas* is thought to haue written best and most learnedly, as touching *Auguries* and the nature of birds. He reports in his book, that the *Howler*, *Scritch-owle*, the *Spight* that pecketh holes in trees, the *Trogon*, and the *Chough* or *Crow*, when they be hatched come forth of their shels with their taile first: and that by reason of their heads so heauy, the eggs are turned with the wrong end downward, & so the hinder part of the body lieth next vnder the henne or the dam, to sit vpon and cherish with the heat of her body.

CHAP. XVII.

¶ Of Owles or Howlers.

IT is a pretty sight to see the wit and dexteritie of these *Howlers* when they fight with other birds: for when they are ouerlaid and beset with a multitude of them, they lie vpon their backs, and with their feet make shift to resist them: for gathering themselves into a narrow compass, there is nothing in a manner to be seen of them, saue only their bill and talons, which couer the whole body. The *Falcon*, by a secret instinct and societie of nature, seeing the poore *Howler* thus distressed, commeth to succor and taketh equal part with him, and so endeth the fray.

fray. *Nigidius* writeth, that Howlets for sixty daies in winter, keepe close and remain in couert, G and that they change their voice into nine tunes.

CHAP. XVIII.

¶ Of the Spight or Woodpecker.

SOME little birds there are also that haue hooked clees, as the Spights, which are known by the surname of Martius, and be therefore called Pici Martij. These are of great account in Auspices and preface good. They that job and pecke holes in trees, and will climbe vp-right like cats, are of this race. As for them, they will rampe vp with their bellies to the tree, bending backward, & when they peck with their bills against the bark, they know by the sound thereof, that there be worms within for them to feed vpon. These birds alone of all others feed and nourish their yong ones in crannies and chinks of trees. And if it chance that a shepherd or some such do pin or wedge vp their holes, it is thought commonly that they will vnstop the same again by meanes of a certaine herbe, which no sooner they touch the stopple with but it will out. *Trebius* writeth, that let a man driue a spike or great naile, or else a wedge or pinne of wood, as hard as euer he will, into that tree wherein this bird hath a nest, incontinently as shee percheth and setleth vpon the tree, it will presently fly out with such a force, that the tree will giue a crack again therewith. Throughout all Latium these birds beare the name for effectual signification of good or bad fortune, by reason of that king or prince [*i. Picius*] who gaue them that name. And one preface of theirs about the rest I cannot passe ouer: It fortuneth that one of them light vpon the head of *L. Tubero* L. chiefe Iustice of the city of Rome, as hee was sitting vpon the judgement seat in the open face of the Court ministring justice, and there rested so gently, that it suffered him to take it with his hand. The Soothsayer being asked his aduice in this case, answered by booke, That if the bird were let go, it would portend the ruine and overthrow of the whole state and empire: but if it were killed, it denounced the death of the sayd Pretor or L. chiefe Iustice then in place. But the Pretor *Tubero* immediatly vpon this answer, plucked the bird in pieces. It was not long after but the preface of this bird took effect indeed, and was fulfilled in his person. Moreover there be of this kind many that feed on mast, acorns, nuts, apples, and such like fruits, but they be such as liue in maner vpon flesh onely. And yet I must except the Kite, for that propertie in him is noted to be in all Augurie an vn lucky signe, and preface of some heauy and deadly misfortune. K

CHAP. XIX.

¶ Of Birds that haue hooked talons and round long clawes like fingers.

WHAT fowles soeuer haue crooked clawes sort not together in flocks, but prey each one apart for it self; and lightly all such fly aloft, vnlesse it be the night birds aforesaid: and the greater sort especially. They are all of them great winged, little bodied, and heavy in their gate vpon the ground. Seldom or neuer they sit and perch vpon a rock: for why, their nails bowing and hooking inward will not giue them leaue. It remains now that we speak of the second kind or ranke of birds, which also is diuided into two sorts; to wit, Ofcines that sing, and Alites that fly only: for the singing of the one and the bignes of the other makes the difference and distinction between them. These therefore that be greater bodied we wil by order treat first of. L

CHAP. XX.

¶ Of Peacocks, and who was the first that killed them for the table.

THE Peacock far surpasses all the rest of this kind, as well for beauty, as also for the wit and vnderstanding that he hath; but principally for the pride and glory he takes in himself. For perceiuing at any time that he is praised and wel liked, he spreadeth his taile round, shewing and setting out his colours to the most, which shine againe like precious stones: and namely when he turnes them against the Sun, as his manner is; for so he giueth them a more radiant and glittering lustre. And for the same purpose also with his taile, representing fish shels,

A shels, he giues a certain shadow to the rest of his feathers, which seeme the brighter when they be a little shadowed: and withall, he sets all those eyes of his feathers together in a ranke, and gathereth them round, knowing full well that hee is the more looked on for them; and therein he taketh no small ioy and pleasure. On the other side, when he hath lost this taile, which vsually he moulteth euerie yere when trees shed their leaues, vntil such time as trees blossom new, and his taile be grown again, he hath no delight to come abroad, but as if he were ashamed, or mourned, seeketh corners to hide himselfe in. The Peacock ordinarily liueth 25 yeares. At 3 yeres of age he begins to put forth that varietie of colours in his feathers. Authors who haue written of him say, that he is not only a proud and vainglorious creature, but also as malicious and spightfull, as the Goose is bashfull and modest: for so haue some of them obserued these properties and qualities in these birds. But I for my part like not to make such similitudes.

B The first that killed Peacocks to be serued vp as a dish at the table, was *Hortensius* that great Orator, in that solemne feast which he made when he was consecrated high priest: and *M. Aufidius Lurco* deuised first to feed them fat, by which inuention of his, he might dispend by yere-ly reuenue, 60000 Sesterces. And this was about the time of the last Pirats war. 488 lib 15 1/2

CHAP. XXI.

¶ Of Cocks, how they be cut and made Capons: also of a dunghill Cocke that spake.

NEXT to Peacocks, these birds about our houses which are our sentinels by night, & whom Nature hath created to breake men of their sleepe, to awaken and call them vp to their work, haue also a sence and vnderstanding of glory; they loue (I say) to be praised, and are proud in their kind. Moreover, they are Astronomers, and know the course of the stars, they diuide the day by their crowing, from 3 houres to 3 houres: when the Sun goeth to rest, they go to roost: and like sentinels they keepe the reliefe of the fourth watch in the camp: they call men vp to their carefull labour and trauell: they will not suffer the Sun to rise and steale vpon vs, but they giue vs warning of it: by their crowing they tell vs that the day is comming, and they foretell their crowing likewise, by clapping their sides with their wings. They are Commanders and rulers of their own kind, be they Hens or other Cocks; and in what house soeuer they be they will be masters and kings ouer them. This foueraignty is gootten by plain fight one with another, as if they knew, that naturally they had spurs, as weapons, giuen them about their heeles, to try the quarrell: and many times the combat is so sharp and hot, that they kill one another ere they giue ouer. But if one of them happen to be conqueror, presently vpon victorie he croweth, and himselfe soundeth the triumph. He that is beaten makes no words, nor croweth at all, but hideth his head in silence; and yet neuerthelesse it goeth against his stomack to yeeld the gantlet and giue the bucklers. Hardly can he brook to be vnder another; and not only these cocks of game, but the very common sort of the dunghill are as proud and high minded: ye shal see them to march stately, carying their neck bolt vpright, with a combe on their head like the crest of a soldiers helmet. And there is not a bird besides himself that so oft looketh aloft to the Sun and sky; and then vp goeth the taile and all, which he beares on high, turning backward again on the top like a hook. And hereupon it is, that marching thus proudly as they do, the very Lions (which of all wilde beasts be most couragious) stand in feare and awe of them, and will not abide the sight of them.

E Now of these Cocks, some of them are made for nothing els but war and fighting, and neuer are they well but in quarrels, brawles, and fraies; and these be cocks of kind: and the countries from whence they come are grown into name, being much renowned for their breed: as namely Rhodus and Tenagra in the first and highest degree. In a second ranke and place be those of Melos and Chalcis. Vnto these birds (for their worth & dignity) the purple robe at Rome, and all magistrats of state disdain not to giue honor. These be they, that by their *tripudium solisimum* [i. hearty feeding] obserued by the pullitiers, shew good successe. These rule our great rulers every day: and there is not a mighty L. or state of Rome, that dare open or shut the dore of his house, before he knowes the good pleasure of these fowles: and that which more is, the foueraigne magistrate in his majestie of the Roman empire, with the regall ensignes of rods and axes caried before him, neither sets forward nor reculeth backe without direction from these birds: they giue order to whole armies to aduance forth to battel, & again command them to stay

stay and keep within the camp. These were they that gave the signal, and foretold the issue of all those famous foughten fields, whereby we have achieved all our victories throughout the whole world: and in one word, these birds command those great Commanders of all nations upon the earth, as acceptable to the gods in sacrifice with their small fibres & filaments of their inwards, as the greatest and fattest oxen that are killed for sacrifice. Moreover, their crowing out of order, too soon before their hour, or too late, and namely in the evening, portendeth also and presageth somewhat by it selfe. For well known it is, that by their crowing at one time all night long, they fore-signified to the Boeotians that noble victory of theirs achieved over the Lacedæmonians. For this interpretation and conjecture was given thereupon of a fortunate day, because that bird never croweth if he be beaten or overcome. If they be once carued and made capons they crow no more. And this feat is practised upon them two manner of wayes; namely, either by burning their loines toward their kidneys with a red hot yron, or else by cauterising their legs beneath, and their spurs, and then presently applying a plaister unto the exulcerate and blistered place, made of potters white clay or chalky earth: and being thus served they will sooner feed and be fat. At Pergamus every yeare there is a solemne shew exhibited openly to the people, of Cocke-fighting, as if sword-fencers were brought within the lists to fight at utterance. We finde in record among our Annales, that within the territorie of Ariminum, in that yeare when *Marcus Lepidus* and *Quintus Catulus* were Consuls, there was a dung-hill cocke did speake: and it was about a ferme-house in the countrey belonging to one *Galerius*. But this hapned neuer but once, for ought that I could euer heare or learne.

CHAP. XXII.

¶ Of Geese, and who first eat the Goose liver. Also of the lease of a Goose of Comagena.

THE Goose likewise is very vigilant and watchfull: witnesse the Capitoll of Rome, which by the meanes of Geese was defended and saved: whereas at the same time, through the default of dogs (which should have given warning) all had like to have bin lost. Wherefore the first thing that the Censors do by vertue of their office, is to take order for the Geese of the Capitol, and to appoint some one man of purpose to see unto them that they have meat enough. Moreover, they are said to be given much to loue: for at Argos there was a Goose that was wonderously enamoured of a faire boy named *Olenus*: as also of a damosel whose name was *Glauce*, who vsed to play on the lute before king *Ptolomeus*: and by report at the same time a Ram made court unto the said wench, and was in loue with her. It may be credibly thought also, that this creature hath some sparks (as it were) of reason, vnderstanding, and learning, for *Lacydes* the Philosopher had one of them about him, which would neuer leaue him night nor day, neither in the open street abroad, nor in priuat house at home; but would follow him euen to his clofe and secret baines where he vsed to bathe. But our countrimen and citifens of Rome (beleeue me) are wiser now adaies, who know, forsooth, how to make a dainty dish of their Liver. For in those Geese that are kept vp and cram'd fat in coup, the liver grows to be exceeding great; and when it is taken forth of the belly, it waxeth bigger still, if it be steeped in milk and sweet mede together. Good cause therefore it is, that there be some question and controuersie about the first inuention of this great good and singular commoditie to mankind: whether it were *Scipio Metellus*, a man who lately was called to be Consulor *M. Sestius*, who in those daies was by his birth a gentleman of Rome. But to leaue that still vndecided, this is certainly known that *Messalinus Cora*, son to that *Messala* the Orator, found out the secret to broile & fry the flat broad feet of Geese, and together with cocks combs, to make a savoury dish of meat thereof between two platters. For surely I for my part will give every man his due and right, and will not defraud them of their singular praise and honour who have bin benefactors to the kitchen, and proceeded masters in cookerie. A marvellous thing of these birds that a flock of them should come all the way bare foot, from * Terwin and Torney in France, as far as to Rome. Their order was who had the conduct of them in this large voyage, to bring those forward that were weary and lagged behind, into the vaward & forefront: and so the rest by a certain thick united squadron (which naturally they make going together) driue the others before them. A second

commo-

A commoditie that Geese yeeld, (especially those that be white) is their plumie and downe. For in some places their soft feathers are pluckt twice a yeare: and yet they carry feathers again, and be as well couered with plumie as before: and euermore the neerer to the skin and flesh, the softer is the downe. But of all other, the finest and best is that which is brought out of Germanie. The Geese there, be all white, but lesse of bodie than from other parts: and there they be called *Ganza*. And truly, a pound of such feathers be worth * 5 deniers. Hereupon it is, that so many complaints are made of Colonels and Captaines, our companies of auxiliarie souldiers for their disorders. For whereas they should keep them together in a standing *corps de gard*, to watch and ward night and day: they license many times whole bands to straggle abroad, to hunt and chase Geese for their feathers and downe. And now forsooth the world is growne to be so delicate and daintie, that not only our fine smooth dames, but also our men, cannot take their repose and sleep without this ware, but complaine of a paine in their necks and heads, vnlesse they may lay them upon bolsters and pillowes of goose feathers, and their soft downe.

Now, to that part of Syria called Comagena, we are beholden for another proper inuention of theirs. They take me the lease and grease of Geese and Cinnamon together, which they put into a brazen pot, and couer it all ouer with good store of snow, wherein they let it lie in steepe, well infused in this cold humor, to vse in that notable composition and sweet ointment, which of that countrey is called Comagenum.

Of the Geese kind are the Birganders named Chelanopeces: and (than which there is not a daintier dish knowne in England) the Chenerotes, lesse than wild Geese.

C As for the pheasant Bustards, they haue a trim shining brightnesse that becommeth and graceeth them exceeding well in their perfect and absolute black hew: and their eie-browes painted red as it were with deep Scarlet.

Another kind there is of them, bigger than Vultures, but in feather and colour much resembling them. And there is not a Foule (setting the Ostrich aside) that poisseth & weigheth more heauy than they: for they grow to that bignes, that a man can hardly lift them from the ground. These breed in the Alpes and the North countries. If they be mued vp and kept in a pen, they lose their pleasant taste, and are no good meat: nay, they grow so fullen and self-willed, that they will die with holding their breath. Next to these are those which in Spaine they call the Slow-birds, and in Greece Otides: but their meat is naught: for the marrow in their bones, if it be let run out, hath such a stinking smell, that a man cannot abide it, but shall be readie to vomite.

CHAP. XXIII.

¶ Of Cranes, Storkes, Swans, Quails, the Glotis, and strange birds of other countries.

THE nation of the prettie Pigmies enjoy a truce and cessation from armes, every yeare (as we haue said before) when the Cranes, who vse to wage war with them, be once departed & come into our countries. And verily, if a man consider well how far it is from hence to the Leuant sea, it is a mightie great journey that they take, & their flight exceeding long. They put not themselves in their journey, nor set forward without a counsell called before, and a generall consent. They flie aloft, because they would haue a better prospect to see before them: and for this purpose a captain they chuse to guide them, whom the rest follow. In the rereward behind there be certaine of them set and disposed to giue signall by their manner of crie, for to range orderly in ranks, and keep close together in array: and this they doe by turnes each one in his course. They maintaine a set watch all the night long, and haue their sentinels. These stand on one foot, and hold a little stone within the other, which by falling from it, if they should chauce to sleepe, might awaken them, and reprove them for their negligence. Whiles these watch, all the rest sleep, couching their heads vnder their wings: and one while they rest on the one foot, and otherwhiles they shift to the other. The captaine beareth vp his head aloft into the aire, and giueth signall to the rest what is to be done. These Cranes if they be made tame and gentle, are very playfull and wanton birds: and they will one by one dance (as it were) and run the round with their long shankes stalking full vntowardly. This is surely known, that when they mind to take a flight over the sea Pontus, they will fly directly at the first to the narrow streights of the sayd sea, lying between the two capes Criu-Metophon and Carambis, and then presently they

Bb 3

ballaife themselves with stones in their feet, and sand in their throats, that they flie more steady and endure the wind. When they be halfe way ouer, down they fling these stones: but when they are come to the continent, the sand also they disgorge out of their craw.

Cornelius Nepos, who died in the daies of *Augustus Caesar* Emperor, in that chapter where he wrote, That a little before his time men began to feed and cram Blackbirds and Thrushes in coupes, saith moreover, That in his daies Storks were holden for a better dish at the board than Cranes. And yet see, how in our age now, no man will touch a Storke if it be set before him vpon the board: but euery one is ready to reach vnto the Crane, and no dish is in more request. From whence these Storks should come, or whither they go againe, is not yet known. No doubt from far remote countries they visite vs, and in the same manner as the Cranes do: only this is the difference, that the cranes are our guests in Winter, and the Storks in Summer. When they be minded to part out of our coasts, they assemble all together in one certain place appointed: there is not one left out nor absent of their owne kind, vnlesse it be some that are not at libertie, but captiue or in bondage. Thus (as if it had been published before by proclamation) they rise all in one entire companie, and away they flie. And albeit well knowne it might be afore, that they were vpon their remoue and departure, yet was there neuer any man (watched he neuer so well) that could perceiue them in their flight: neither dowe at any time see when they are coming to vs, before we know that they be alreadie come. The reason is, because they doe the one and the other alwaies by night. And notwithstanding that they flie too and fro from place to place, and make but one flight of it, yet be they supposed neuer to haue ariued at any coast but in the night. There is a place in the open plaines and champion countrey of Asia, called Pithonos-Come: where (by report) they assemble all together, and being met, keepe a jangling one with another: but in the end, look which of them lagged behind and came tardie, him they reare in peeces, and then they depart. This also hath been noted, that after the Ides of August they be not lightly seene there.

Some affirme constantly, that Storks haue no tongues. But so highly regarded they are for slaying of Serpents, that in Thessalie it is accounted a capitall crime to kill a Storke, and by law he is punished as a Fellon in the case of manslaughter.

After the same maner wild Geese and Swans do sort together, when they be passengers from countrey to countrey: but all these are seene when they flie. They makeway forcibly in a pointed Squadron, like as it were the stem of a foist at sea, armed with a sharp beakehead (for by this meanes they breake and cut the aire better, than if they draue it before with a streight, euene, and square front.) And thus wedg-wife by little and little they spread broader and broader behind, and beare a great length besides with them: by which meanes also they gather more wind to haue them vp and set them forward. In this their flight they rest their heads vpon the former: and euer as one that leadeah the way is wearie with bearing his head, he retires behind to ease himself vpon him that flieth next before. Storks keep one nest stil from yeare to yeare, and neuer chang: and of this kind nature they are, that the yong will keep and feed their parents when they be old, as they themselves were by them nourished in the beginning.

Some say that the Swans sing lamentably a little before their death, but vntruly, I suppose: for experience in many hath shewed the contrarie. Howbeit, these foules vse to eat and deuour one another.

But since we are entred into this discourse of those foules that make voiajes by whole flocks ouer sea and land to see strange countries, I cannot put off to speak of lesser birds also, which are of the like nature. For those beforenamed may seeme in some sort to be induced to such great trauell, so bigge they are of bodie, and so strong withall. As touching Quailles therefore, they alwaies come before the Cranes depart. A little bird it is, and whiles she is among vs here, mounteth nor aloft in the aire, but rather flieth below neere the ground. The manner of their flying is like the former, in troupes: but not without some danger of the sailers when they approach neer to land. For oftentimes they settle in great number on their sailes, and there perch, which they doe euermore in the night, and with their poise beare downe barks and small vessels, and finally sinke them. These Quailles haue their set gifts, to wit, ordinarie resting and baiting places. When the Southwind blowes, they neuer flie: for why? it is a moist, heavy, and cloggie wind, & that they know well ynough. And yet they willingly chuse a gale whensoever they flie, by reason that their bodies are too weightie (in comparison of their wings) to beare them

- A them vp: and besides, their strength is but small. And hereupon it is, that as they flie, they seem by their manner of crie to complaine, as though they flew with paine. Commonly therefore they chuse a Northerne wind to flie with: and they haue one mighty great Quaille called *Orytometra*, to lead the way and conduct them, as their captain. The foremost of them, as he approacheth neere to land, paieeth toll for the rest vnto the Hauke, who presently for his welcome preieth vpon him. Whensoever at any time they are vpon their remoue and departure out of these parts, they perswade other birds to beare them company: and by their inducements, there go in their train the Glottis, * Otis, and the Cychramus. As for the Glottis, he putteth forth a long tongue, wherupon he hath that name. This bird is very forward at the first setting out (as being desirous to be a traveller, to see far countries, and to change the aire:) and the first daies journey he vndertaketh with pleasure: but soone finding the tediousnesse and paines in flying, he repents that euer he enterprised the voiage. To go backe again without company, hee is ashamed: and to come lag behind he is as loth: howbeit, for that day he holdeth out so so, and neuer goeth farther: for at the next resting place that they come vnto, hee faire leaueth the company and staith there, where lightly he meeteth with such another as himselfe, who the yere before was left behind. And thus they do from time to time, yere by yere. As for the Cychramus, he is more staid and resolute to indure the trauel: he maketh hast and hath an earnest longing to come into those parts which he so much desires: & therefore in the night season he is as good as a trumpet to awake the rest, & put them in mind of their iourney. The Otis is a bird lesse than the Like-Owle, bigger than the Howlet, hauing two plumed ears standing vp aloft, wherupon he took that name Otis in Greeke. But in Latine some haue called him Asio. This bird besides hath certain qualities by her self, & is skilful to counterfeite and make gestures like a flattering parasite: she can foot it, turn and trip, mount and capre, as if she were a professed dauncer: easie she is to be taken like as the Howlet, for whiles she is amused and looking wistly vpon one that goeth about her, another commeth behind and soon catcheth her. But to return to our Quailles afore said. If a contrarie wind should chance to arise and begin to driue against them, and hinder their flight: to preuent this inconuenience, they be well provided. For they flie well ballaisted either with small weightie stones within their feet, or els with sand stuffed in their craw: the seed or grain of the white Elebore (a very poison) they loue passing wel, & it is their best meat.
- D; But hereupon it is, that they are not serued vp as a dish to the table. Moreouer, they are wont to some and slauer at the mouth, by reason of the falling sicknesse, vnto which they onely of all other creatures, but man againe, are subiect.

* The Bistard
or Hota-owle

CHAP. XXIV.

Of Swallowes, Ousles, or Merles, Thrushes, Stares or Sterlings, Turkie, and Storkedoues.

- THE Swallows likewise (the birds alone of all those that haue not crooked claws, which feed vpon flesh) are gone from vs all Winter time. Howbeit, they depart not far off, but seeke only the Sun-shine noukes, betweene hills neere at hand, and follow the warmth. Where many times they are found naked, and without feathers altogether, as if they had moulted. It is said, that they will neuer build their nests vnder any house in Thebes: because that city had bin many times forced and taken by the enemy. Neither in Bizia, a city of Thrace, by reason of the detestable parts practised by *Tareus* there. *Cecina* of Volaterra, a Gentleman of Rome by calling (gouvernour and master of the coaches and coach-horses that vsed to runne for the prize and best game) was wont to bring with him into the city, a number of these Swallowes, which he had gotten in diuers places where he came, out of his friends houses wherein they were bred. And when the horses which hee had in charge obtained at any time victorie in the race, hee would take the birds, and paint them with that colour which betokened victorie, and so with that liuerie (as it were) let them flie to his friends, for to carry tidings vnto them of the good successe which hee had obtained: knowing right well, that euery one would home to the same nest from whence they came. And thus in small space could hee enforme his comforts and well-willers of his good speed. Also *Fabius Pictor* reporteth in his Annales, That when a fort (which the Roman garrison held) was besieged by the Ligustines; there was a shee Swallow newly taken out of her nest within that fort, from her little ones as shee sat ouer them, and brought

brought to him with this watchword, That by a linnen thred tied to her foot in stead of a letter, he should aduertise them within the fort, by so many knots tied in the said thred, as there would daies passe before aid could come from him vnto them, to the end that they also might be ready vpon that day to fallie forth.

Oufles, Throftles, Blackbirds, and Stares, after the same manner depart aside from vs, but go not far. Howbeit, these cast not their feathers, nor lie altogether hidden: but are seen oftentimes in places, from whence they fetch meat to serue them in the Winter. And therefore it is, that Blackbirds are common in Germany, and specially in Winter time.

The Turtle more properly and truly is said to hide her self, and to shed her plume & moult. Stockdoves likewise depart from vs, but whether they go no man knoweth.

As touching Sterlings, it is the property of the whole kind of them to flie by troupes, and in their flight to gather round into a ring or bal, whiles euery one of them hath a desire to be in the midst.

Of all birds, the Swallow alone flieeth bias, and windeth in and out in his flight: he is most swift of wing, and flieeth with ease: and therefore not so ready to be surprised and taken by other birds. To conclude, he neuer feedeth but flying, and so doth no other bird besides.

CHAP. XXV.

¶ *What birds continue with vs all the yeare long: which be halfe yeares birds, and which be but for three moneths.*

Great difference there is in the seasons and times of birds. Some abide the whole yeare, as house-doves: others halfe the yeare, as Swallows: and some again but a quarter, as blackbirds and Turtle-doves. And there be againe that are gone so soone as they haue hatched and trained their young abroad into the open aire. Such be the Hu-holes, and Houpes [or Lapwings as some thinke.]

CHAP. XXVI.

¶ *Strange stories of birds.*

Writers there be who affirme, That euery yeare certain birds come flying out of Ethiopia to Ilium, and there, about the tombe or sepulchre of Memnon, skirmish and fight a battell. For which cause men call them Memnonides. And Cremutius auoucheth vpon his owne knowledge, That euery fifth yere the same birds do the like in Aethyopia, euen before the roiall palace somtime of the said king Memnon.

Sensibly, the birds named Meleagrides, do fight a field in Boeotia. Now are these Meleagrides a kind of Turkey-cocks, and hens of Africk, hauing a bunch on their back, and bespotted with feathers of sundry colours. Of all strange birds, comming out of forreine parts, these are last receiued and admitted to serue the table, by reason of a certain harsh and vnpleasant strong taste that they haue. But it is the monument and tombe of Meleager which hath giuen them that name and credit which they haue.

CHAP. XXVII.

¶ *Of birds surnamed Selencides.*

The birds called Seleucides, come to succour the inhabitants of the mountaine Casius, against the Locusts. For when they make great waste in their corne and other fruits, Iupiter at the instant praiers and supplications of the people, sendeth these fowls among them to destroy the said Locusts. But from whence they come, or whether they go again, no man knoweth: for neuer are they seene but vpon this occasion, namely, when there is such need of their helpe.

CHAP. XXVIII.

¶ *Of the bird Ibis.*

The Egyptians likewise haue recourse in their prayers & inuocations to their birds named Ibis, w^hat time as they be troubled and annoied with serpents comming among them: and

A in like case the Eleans seeke vnto their god *Myiagros*, for to be rid of a multitude of flies which pester them so, that they breed a pestilence among them. But looke vpon what day they find that Idoll appeased and pacified by their sacrifice, all the flies die forth-with.

CHAP. XXIX.

¶ *What birds they be, which will not abide some places: also which be they that change colour and voice: and then of the Nightingale.*

B Vt that which wee should haue said when wee wrote of the departure and going aside of birds: the Howlets also are reported to lie hidden some few daies. Moteouer, this is known for a truth, That in the Island Candy there be none at all of them: and in case that any one be thither brought, it will die there. A wonderful thing, that nature should make difference of birds and other creatures in that respect. But sure it is, she hath not brought forth all creatures in all places, but hath priuiledged this country more than that: & denied that to one which she hath giuen vnto another. And thus hath shee dealt not onely by fruits of the earth, trees, and plants, but also by liuing creatures. That in some parts this or that should not grow or breed, is a thing commonly seen & known: but, that those things should die so soon as they are brought thither, is very strange & wonderfull. What should that be, which is so contrary vnto one kind and no more, as that it will not suffer it to liue? What enuie is this of Nature, thus to hinder

C the breeding or life of any creature? or why should birds be restrained within any limits and bounds in the whole earth? And yet see! In all the Island of Rhodes a man shall not find one Airie of Eagles. In that tract of Italy beyond the Po, and neere vnto the Alpes, there is a lake which they call there Larius; the place about it is right pleasant and delectable, enriched with goodly trees that beare fruit, and faire fields for pasturage: and yet a man shall neuer see any Stork to come thither, no nor within 8 miles of it. And yet in the neighbor quarters of the Insubrians neer adioyning, ye shall haue infinite and innumerable flocks and flights of choughes and jack-dawes: the veriest theeves, nay the only theeves of all other birds, especially for siluer and gold, that it is a wonder to see what meanes they will make to steale and filch it. Men say that in the territory of Tarentum there be no wood-pecks or tree-jobbers. It is but of late daies

D since that from the mountaine Apennine toward the city of Rome there haue been seen Pyanets with long tailes, party coloured and flacked, wherupon they be called Variæ: and yet such are not common, but very geason to be found. Their property is to be bald euery yeare, what time as men sow rapes or hauewes. The Patridges in the territory of Attica, flie not ouer into the marches of Boeotia. And there is not a bird within the compasse of the sea Pontus, & namely, in the Island wherein Achilles was buried, that will passe beyond the temple consecrated vnto him. In the territory of Fidenæ neer to Rome, Storkes build no nests, neither shall a man find a yong Stork there. But into the parts about Volaterræ, there is not a yeare but one shall see a world of Stockdoves flying from beyond sea. At Rome ye shall not haue a fly or dog that will enter into the chappell of Hercules standing in the beast market. In a word, I could alledge many such like examples, which of purpose I passe ouer, because I would not be tedious in my discourses: seeing that Theophrastus reports, how all the Doves, Peacocks, and Rauens, which are in Asia, haue been brought thither from other parts: like as all the Frogs in Cyrenaica, which doe crie, whereas their owne be mute all,

E As for singing birds, this is another strange and wondrous thing obserued in them. For at certain times of the yere they change their colour in feathers, and alter their voice in singing: and that in such sort, as of a suddaine a man would say they were other birds. A thing that happeneth not to the great fowles aboue-said, saue only vnto Cranes: for they with age wax black. And to begin with the Merle or black-bird, which naturally is blacke, he turnes to be reddish. In Summer he singeth cleare and tunably, in winter he stuteth and stammereth: but about the sun-stead in December he is mute and dumbe altogether. After they be once a yere old, I mean the cockes or males onely of that kinde, their bills turne to be white like yuorie. The Throftles or Mauiffes all Summer be painted about the necke with sundry colours, but in Winter they be all of a colour.

The Nightingale for fiftene daies and nights together, neuer giueth ouer but chauntereth continually, namely, at that time as the trees begin to put out their leaues thicke. And surely this

this bird is not to be set in the last place of those that deserue admiration: for is it not a wonder **G** that so loud and cleare a voice should come from so little a body? Is it not as strange that shee should hold her wind so long, and continue with it as she doth? Moreouer, she alone in her song keepeth time and measure truly, she riseth and falleth in her note just with the rules of Musick and perfect harmony; for one while, in one entire breath she drawes out her tune at length treatable, another while she quauereth, and goeth away as fast in her running points: sometime she maketh stops and short cuts in her notes, another time she gathereth in her winde and singeth descant between the plain song: she fetcheth her breath againe, and then you shall haue her in her carches and diuisions: anon all on a sudden, before a man would thinke it, she drowneth her voice, that one can scarce heare her: now and then she seemeth to record to her selfe; and then she breaketh out to sing voluntarie. In sum, she varieth and altereth her voice to all keies: **H** one while, full of her largs, longs, briefs, semibriefs, and minims; another while in her crotchets, quauers, semiquauers, and double semiquauers: for at one time you shall heare her voice full of loud, another time as low; and anon still and on high: thick and short when she list; drawn out at leisure againe when she is disposed: and then (if she be so pleased) she riseth and mounteth vp aloft, as it were with a wind-organ. Thus she altereth from one to another, & sings all parts, the Treble, the Mean, and the Base. To conclude, there is not a pipe or instrument againe in the world (deuised with all the art and cunning of man so exquisitely as possibly might be) that can affoord more musick than this pretty bird doth out of that little throat of hers. So as no doubt there was fore-signified most excellent and melodious musick, by an excellent preface of a nightingale which settled vpon the mouth of *Stesichorus* the Poet, and there sung full sweetly: **I** who afterwards proued to be one of the most rare and admirable musitians that euer was. And that no man should make a doubt that there is great Art and cunning herein, do but marke, how there is not one Nightingale but hath many notes and tunes. Again, all of them haue not the same, but euerie one a speciall kind of Musick by her selfe: nay, they strue who can do best, and one laboreth to excell another in varietie of song and long continuance: yea, and euident it is, that they contend in good earnest with all their will and power: for oftentimes shee that hath the worse and is not able to hold out with another, dieth for it, and sooner giueth she vp her vitall breath, than giueth ouer her song. Ye shall haue the yong Nightingales studie and meditate how to sing, by themselves; ye shall haue them listen attentiuely to the old birds when they sing, and to take out lessons as it were from them, whom they would seeme to imitate staffe by **K** staffe. The schoher when she hath giuen good care vnto her mistresse, presently rehearseth what she hath heard; and both of them keep silence for a time in their turns. A man shall euidently perceiue when the yong bird hath learned well, & when again it must be taught how to correct and amend wherein it did amisse; yea, and how the teacher will seeme to reprove and finde a fault; no maruell therefore if one of these Nightingales carrie the price (in the market) of a bond-slave; yea and a higher too, than a man might in old time haue bought a good page & harnesse-bearer. I my selfe haue knowne one of them (may it was white, which was a rare thing and not commonly seen) to haue bin sold for 6000 Sesterces, for to be giuen as a Present vnto the Emperesse *Agrippina*, wife of *Claudius Caesar* late Emperor of Rome. And now of late we haue known **L** many of them taught to begin to sing, only when a man would haue them: and keepe their responds in course after others, in good consent and harmony. As also there haue bin found men, who by a deuise of a reed or cane had out of the water, put crosse ouerthwart their mouth, and by putting their tongue into an hole made of purpose in it, and blowing withal, could counterfeit the Nightingale so perfectly, that one might not discern and distinguish the one from the other. Well, these little Nightingales, so great chanters as they be, so cunning and full of their conceits, after 15 daies begin to abate and slack their musick; yet so, as a man cannot say, they were either wearie, or satisfied with singing: for soone after, when the weather groweth hotter, their voice is cleane altered: for neither are they musically and tuneable in their measures with varietie as before, but only sing plain song and keep them to one tune. And more than so, they **M** change their colour in proceesse of time: and last of all, when winter comes, be no more seene. Tongued they are not like other birds, with a thin tip before. They begin to breed with the first in the prime of the Spring, and commonly lay six eggs.

The Gnat-snapper, *Ficedula*, a bird somewhat like vnto the Nightingale, doth otherwise: for at one time it changeth both colour, form, and song. They haue not that name *Ficedula* properly

A perly but in the Autumne, as one would say, fig-feeders: for when that season is once past, they be called *Melanocoryphi*, i. Black-heads.

In like sort, the bird which is named *Erithacus* (i. Robin, or Redbreast) in winter; the same is *Phoenicurus* [i. Red-taile] all summer long.

The Houpe or Vpupa (as *Æschylus* the Poet saith) changeth also her hew, voice, and shape. This is a * nasty and filthy bird otherwise, both in the manner of feeding, and also in nestling: but a goodly faire crest or comb it hath, that will easily fold and be plaited: for one while shee will draw it in, another while set it stiffe vpright along the head.

As for the bird *Oenanthe*, it also for certain daies lieth close and vnseen; & namely, when the Dog-star ariseth, it is hidden: but after the occultation thereof, commeth abroad & sheweth her selfe: a strange thing, that in those daies it should do both. Last of all, the * Witwall or Lariot, * Chlorion,

B which is all ouer yellow, being not seen all winter time, appeareth about the Sun-steads.

CHAP. XXX.

¶ Of the Merles.

A Bout Cyllene in Arcadia, and nowhere els, ye shall find white Merles or Oufles. And Ibis; about Pelusium only in Egypt, is blacke; in all places else of Ægypt, white.

CHAP. XXXI.

¶ The kind of birds breeding and hatching.

C All singing birds, saue only those that are excepted before, lightly breed nor nor lay their eggs before the spring Æquinoctiall in mid-March, or after the Autumnnall, in mid-September. And those that they hatch before the Summer Sunstead (i. Mid-Iune) hardly come to any perfection: but after that time, they do well enough and liue.

CHAP. XXXII.

¶ Of the Halcyones, or Kings-fishers: and the daies good for nauigation which they shew. Of the Sea-gulls and Cormorants.

D And in this regard especially, namely for breeding after the summer Sunstead, the Halcyones are of great name and much marked. The very seas, and they that saile thereupon, know well when they sit and breed. This very bird so notable, is little bigger than a sparrow: for the more part of her pennage, blew, intermingled yet among with white and purple feathers, hauing a thin smal neck and long withall. There is a second kind of them breeding about the sea side, differing both in quantitie and also in voice; for it singeth not as the former doe which are lesser, for they haunt riuers, & sing among the flags & reeds. It is a very great chance to see one of these Halcyones, & neuer are they seen but about the setting of the star *Virgilie*; [i. the Brood-hen:] or els neere Mid-summer or Mid-winter: for otherwhiles they will flie about a ship, but soone are they gone againe and hidden. They lay and sit about Mid-winter when daies be shortest; & the time whiles they are broody, is called the Halcyon daies: for during that season, the sea is calme and nauigable, especially in the coast of Sicilie. In other ports also the sea is not so boisterous, but more quiet than at other times: but surely the Sicilian sea is very gentle, both in the Streights and also in the open Ocean. Now about seuen daies before Mid-winter, that is to say, in the beginning of December, they build; and within as many after they haue hatched. Their nests are wonderously made, in fashion of a round ball: the mouth or entrie thereof standeth somewhat out, and is very narrow, much like vnto great sponges. A man cannot cut and pierce their nest, with sword or hatchet; but breake they wil with some strong knock, like as the dry some of the sea: and no man could euer find of what they be made. Some thinke they are framed of the sharpe pointed prickes of some fishes, for of fish these birds liue.

F They come vp also into fresh riuers within-land: and there do lay ordinarily fiew eggs.

As touching the Gulls or Sea-cobs, they build in rocks: and the Cormorants both in them, and also in trees. They vsually lay foure eggs apiece. The Gulls in summer time, but the Cormorants in the beginning of the spring.

CHAP.

CHAP. XXXIII.

¶ The industrie and wit of birds in building their nests. Of the Swallow, the Argatilis, Cinnamologus, and Partridges.

THe Architecture and building of the Halcyones nest, hath put me in mind of other birds dexteritie in that behalfe: and surely in no one thing is the wit of silly birds more admirable. The swallows frame their nests of clay & earth, but they strengthen and make them fast with straw. In case at any time they cannot meet with soft and tough clay, for want thereof they drench and wet their feathers with good store of water, and then bestrew them ouer with dust. Now when they haue made and trimmed their bare nest, they floore it in the bottom within, and dresse it all ouer with downe feathers or fine floss, as well to keep their eggs warm, as also that their yong birds should lie soft. In feeding of their little ones, they keepe a very good order and euen hand, giuing them their pittance and allowance by course one after another. Notable is their care in keeping them neat and cleane; for euer as they meut, they turne the excrements out of the nest: but be they once growne to any strength and bignesse, they teach them to turne about and lay their tailes without.

Another kinde there is of Swallows, that keep in the country villages and the fields, which seldom nestle vnder mens houses: and they likewise build of the same matter as the former do, namely, of clay and straw, but after another fashion: for their nests are made turning all vpward, with the hole or mouth that leadeth vnto it, stretched out in length freight and narrow, but the capacitie within is very large, in such sort, as it is a wonder to see how prouident & skilful they should be to frame them in this manner, so handsome & conuenient to couer their yong ones; so soft again for their couch and bed. In the mouth of Nilus neere Heraclea in Egypt, there is a mightie banke or causey raised only of a continuall ranke and course of Swallows nests, piled one vpon and by another thicke, for the length almost of halfe a quarter of a mile; which is so firme and strong, that being opposed against the inundations of Nilus, it is able to breake the force of that riuer when it swelleth, and is it selfe inexpugnable: a piece of work that no man is able to turne his hand vnto. In the same Egypt neere vnto the towne Coptos, there is an Island consecrated vnto the goddesse Isis, which euery yere these Swallows do rampier and fortifie, for feare lest the same Nilus should eat the banks thereof and break ouer into it. In the beginning of the Spring, for three nights together, they bring to the cape of that Island, straw, chaffe, and such like stuffe, to strengthen the front thereof: and for the time, they ply their businesse so hard, that for certaine it is knowne, many of them haue died with taking such paines and moiling about this worke. And verily euery yere they go as daily to this taske againe, as the Spring is sure to come about; and they faile not, no more than souldiers that by vertue of their militarie oath and obligation, go forth to seruice and warfare.

A third sort there is of these Swallows and Martinets, which hollow the banks of riuers, and so nestle within between. The yong birds of these Martins, if they be burnt into ashes, are a singular and soueraigne remedy for the deadly squinancy, and helpe many other diseases of mans body. These build not at all, but if they perceiue that the riuer Nilus when it swelleth, will rise as high as their holes, they are gone many daies before.

There be certaine birds of the kind of Partridge, which of drie mosse make a nest, resembling perfectly a round ball, that vnneth or hardly a man can see which way they should goe in. And another there is called Argatilis, which contriueh her nest after the same forme, but it is of hurds and flaxe.

There is a kind of Woodpecker, maketh a nest in manner of a cup or goblet, and hangeth it at a twig vpon the vppermost boughs and branches of a tree, that no foure footed beast should reach it. And as for the birds called Gulguli, men say for a truth, that they take their sleep hanging all by their legges to some branch, thinking by that means they are in more safety. True it is indeed and commonly known, that all these birds in great forecast & prouidence, chuse some crosse boughes in stead of rafters, to suphorth and beare vp their nests; and then to saue them from the raine, either vault them ouer with an arched rooffe, or else couer them close and thicke with leaues.

A bird there is in Arabia called Cinnamologus, which with the twigs and branches of the Cinnamon

A Cinamon tree buildeth her nest. The inhabitants of that country being ware thereof, shake the same downe by shooting arrowes headed with lead, for to make a commoditie thereby. In Scythia, there is a bird of the bignesse of an Otis, which commonly laith two eggs, and when they are lapped within a hares skin, alwaies hangeth them vpon the top of tree boughes. The Pyanets, when they perceiue (by a watching eie that they haue) that a man hath spied their nest, presently build in another place, and remove their eggs thither. Now for those birds which haue no hooked nailes, how they should translate their eggs from one place to another, considering their feet are not made to clasp them, it is a wonderful thing, and reported after a strange manner; for they lay a stick ouer two eggs, and soudier it fast to them with a certain viscositie which

B commeth forth of their own guts when they meut: which done, they put their neckes vnder the stick between both eggs, which hanging equally poised of either side, they carry easily whither they would.

No lesse industrious are they that make their nests in the ground, as being nor able to fly into the aire by reason of their weightie bodies. Among which there is one called Merops, that useth to feed her parents, lying hidden within the earth. The inside of her feathers in the wing is pale, the outside blew; and yet those about their neck, are somewhat red. She makes her nest in an hole six foot deep within the ground. Again, the Partridges do so fortifie and impale their nests with thornes and twigs of shrubs and bushes, that they be sufficiently fenced against the inuasion of wilde beasts. They couer their eggs with a soft carpet or hilling as it were of fine dust: neither do they sit where they laid them first, nor yet in a place which they suspect to be much frequented with resort of passengers, but conuey them to some other place. The hennes verily of this kind, hide themselves from their males the cocks; for so lecherous they be and giuen to intemperate lust, that they would squash their eggs, because they should not be amused and occupied about sitting. Then, for want of the females, the males go together by the eares: and (as they say) he that is ouercome, suffereth himselfe to be troden like an hen. Trogon verily reporteth the very same of the Quailles, yea and of dounghill cocks otherwhiles. He saith moreover, that tame Partridges vse to tread the wild: also that those which are new taken or beaten, be troden of others indifferently one with another. This libidinous heat of theirs is such, and maketh them so quarrelsome, that oftentimes they are taken by that means. For when the fowler

C commeth with his pipe or call (resembling the female) to allure and traine them forth, out goeth the captain of the whole flocke directly against him: and when he is caught, another followeth after, and so the rest one after another, one by one. In like manner, they vse to take the females, at what time as they seeke the male to tread them: for then, forth they goe against the fowlers chantetell or watch which calleth them out, that with their quarrelling and brawling which they make, they might chace and driue it away. In sum, there is not to be found in any other liuing creature, the like againe for lust and lecherie in the act of generation. If the hen do but stand directly ouer against the cocks, the very wind and aire that passeth from them, will cause them to conceiue as well as if they were troden. For so hot they be in that season, that they gape again for aire, and hang the tongue out of their heads. And if the males do but flie ouer

E them, with the very breath and aire that commeth from them, they will be ready to conceiue: yea and many times, if they do but heare their call. And that which more is, so lecherous they are, that setting aside their naturall affection and loue to their yong couie, when they are broody (and in which regard they steale from the cocke, and sit apart in some secret and blind corner) yet if they heare once the Fowlers chanterell comming toward the male, and that he doth call, presently they will leaue the nest and suffer the eggs to chile, and for very ieaousie cry again and call backe the males, and offer themselves to be troden, for feare they would goe to others. Nay more than that, their fury and rage that way many times is such, that otherwhiles in this blind fit and fearfull lust, not knowing where they are nor what they do, they will light and fettle vpon the very head of the fowler. Also, if he chance to approach the nest of the brood-hen, she will run forth and be about his feet, she wil counterfeite that she is very heauy and cannot scarce go, that she is weake and enfeeblished: and either in her running, or short flight that she taketh, she wil catch a fall, and make semblance as if she had broken a leg or a wing: then will she run out againe another way, and when he is ready to take her vp, yet will she shift away and escape, and so put him besides his hope. And all this doth shee to amuse the Fowler after her, vntill she haue trained him a contrary way from the couey. Now by that time that shee is past that

feare

feare, and freed of the motherly care she had of her yong ones, then will she get into the furrow of some land, lie along on her back, catch a clot of earth vp with her feet, and therewith hide her whole body, and so saue both her selfe and her coney. To conclude, Partridges (by report) liue 16 yerres.

CHAP. XXXIV.

¶ Of House-doues.

NExt after Partridges, the nature of Doues would be considered, since that they haue in a manner the same qualities in that respect: howbeit, they be passing chaste, and neither male nor female change their mate, but keep together one true vnto the other. They liue (I say) as coupled by the bond of marriage: neuer play they false one by the other, but keep home still, and neuer visit the holes of others. They abandon not their owne nests, vnlesse they bee in state of single life or widdowhead by the death of their fellow. The females are very meek and patient; they wil indure and abide their emperious males, notwithstanding otherwhiles they be very churlish vnto them, offering them wrong and hard measure; so jealous be they of the hens, and suspicious, though without any cause and occasion giuen: for passing chaste and continent by nature they are. Then shall ye heare the cocks grumble in the throat, quarrell and complain, and all to rate the hens: then shall ye see them peck and job at them cruelly with their beakes; and yet soone after, by way of satisfaction, and to make amends again for their curst vsage, they will fall to billing and kissing them louingly, they will make court vnto them and wooe them kindly, they will turne round about many times together by way of flatterie, and as it were by praies seeke vnto them for their loue. As well the male as the female be careful of their yong pigeons, and loue them alike; nay ye shall haue the cocke oftentimes to rebuke, yea chastise the hen, if she keep not the nest well; or hauing bin abroad, for comming no sooner home againe to her yong. And yet, kind they be to them, when they are about to build, lay, and sit. A man shall see how ready they be, to helpe, to comfort and minister vnto them in this case. So soon as the eggs be hatched, ye shall see them at the very first, spit into the mouths of the yong pigeons salt brackish earth, which they haue gathered in their throat, thereby to prepare their appetite to meat, and to season their stomachs against the time that they should eat. Doues and Turtles haue this property, in their drinking not to hold vp their bills between-whiles, and draw their necks backe, but to take a large draught at once, as horses and kine do.

CHAP. XXXV.

¶ Of Stockedoues.

Some authors we haue, who affirme that Stockdoues liue ordinarily 30 yerres, and some vn- till they be 40 yerres old. In which time they find no infirmitie nor discommodity at all but only this, That their claws be ouergrowne, which is a signe of their age: howbeit they may be pared without danger. They haue all of them one and the same manner of tune in their singing, and commonly they make three rests in their song, besides the fa-burden in the end, which is a kind of grone. All winter they be silent: in spring they are loud enough, & the woods resound with them. *Nigidius* is of opinion, that if a man call vnto a Stockdove within-house as she is sitting vpon her eggs, she will leaue her nest, and come at the call. They doe lay after Mid-summer. These doues and Turtles liue eight yerres.

CHAP. XXXVI.

¶ Of Sparrowes.

Contrariwise, the Sparrow is but short liued, howbeit as lecherous as the best. The cocke Sparrow (by report) liueth but one yeare; the reason why men so thinke, is, because in the spring there is not one of them found with a blacke bill, and yet in summer before, it began to be blacke. The hens liue somewhat longer. But to come againe to Doues, it is generally held, that they haue a certaine sense and feeling of glory: and a man would verily thinke, that they haue a knowledge of their gay feathers, and how they are changeably coloured as a man looketh

A looketh vpon them & as they stand. Moreouer, they seem to take a pride in their flying, whiles they keep a clapping of their wings and cutting of the aire euery way, as if they had a pleasure to be flying abroad. In which brauerie of theirs, whiles they flap with their wings and keepe a glorious noise (which cannot be without the beating of their very pinions together) they are exposed to the Faulcon and other hawks, as prisoners fast bound and tied: for otherwise if they would flie at liberty and ease, without keeping such adow with their clapping, they were much more swift of wing, than the very hawks that prey vpon them. But the hawke like a very theefe lieth hidden among the boughes and branches of trees, marketh the Dove how he fetcheth his flight and taketh his pleasure in the aire; and when he seeth his time (in all this glory of his and the mids of his brauerie) seizeth vpon him and carrieth him away.

CHAP. XXXVII.

¶ Of the Kestrell.

TO preuent this danger therefore, the Doues need to haue with them the bird which is called *Tinnunculus*, i. a Kestrell, or Stannell: for she defendeth them, and (by a certaine naturall power that she hath) skareth and terrifieth all other hawkes in so much, as they cannot abide either to see her, or to heare her cry. Wherevpon Doues about all others, loue these birds. And (as men say) pigeons wil not leaue their own douecoate to flie to another, if in the foure corners thereof there be entered foure Kestrels abovesaid, in foure new earthen pots well nested, and neuer vsed before. But others haue vsed means to keep pigeons in their douehouse (for otherwise they be birds that loue to be ranging and wandring abroad) namely, by stirring, and cutting the ioints of their wings with some thin sharp piece of gold: for if you do not so, their wounds will fester and be dangerous. And in very truth, these birds be soon seduced and trained away from their owne homes: and they haue a cast with them to flatter and entise one another: they take a great delight to inueagle others, and to steale away some pigeons from their owne flocks, and euermore to come home better accompanied than they went forth. Moreouer, Doues haue serued for posts and courriers between, and bin imploied in great affairs, and namely, at the siege of Modenna, *Decimus Brutus* sent out of the town letters, tyed to their feet, as far as to the camp where the Consuls lay, and thereby acquainted them with newes, and in what estate they were within. What good then did the rampier and trench, which *Antony* cast before the towne? To what purpose serued the streight siege, the narrow watch, and ward that he kept: wherefore serued the riuer Po betwene, where all passages are, stopped vp as it were with net and toile, so long as *Brutus* had his posts to flie in the aire ouer all their heads? To be short, many men are growne now to cast a speciall affection and loue to these birds: they build Turrets about the tops of their houses for dove-coats. Nay they are come to this passe, that they can reckon vp their pedigree and race, yea they can tel the very places from whence this or that pigeon first came. And indeed one old example they follow of *L. Axiu* a Gentleman some time of Rome, who before the ciuill war with *Pompey*, sold euery paire of pigeons for 400 deniers, as *M. Varro* doth report. True it is, that there goeth a great name of certaine countries where some of these pigeons are bred: for Campanie is voiced to yeeld the greatest and fairest bodied of all other places. To conclude, their manner of flying induceth and traineth me, so thinke and write of the flight of other foules.

CHAP. XXXVIII.

¶ Of the gate and flight of birds.

ALl other liuing creatures haue one certaine manner of marching and going, according to their seuerall kind, vnto which they keep and alter not. Birds only vary their course, whether they go vpon the ground or flie in the aire. Some walke their stations, as Crows and Choughs; others hop and skip, as Sparrows and Ousels: some run, as Partridges, Woodcocks, and Snites; others again cast out their feet before them, stauk and jer as they go, as Storks and cranes: now for flying, some spread their wings abroad, stirring or shaking them but now & then, hanging

hanging and howering with them all the while [as Kites:] others again ply them as fast; but the ends only of their wings, or the utmost feathers are seen to moue [as the Chaffinch.] Yee shall haue some birds, to stretch out their whole wings & sides, mouing them as they flie [as Rauens] and others a man shall see in their flight to keep them in, for the most part close [as the Woodpeckers.] Some of them are known to giue one or two claps with their wings at first, and then glide smoothly away, as if they were carried and borne vp with the aire [as Linnets:] and others are seen (as if they kept stil the aire within their wings) to shoot vp aloft & mount on high, to flie streight forward; & to fall down again flat [as Swallows.] Yee would think and say that some were hurled out of a mans hand with violence [as the Partridge:] and others again to fall down plume from on high [as Larks,] or els to leap & jump [as the Quails.] Ducks, Mallards, and such like, spring presently from the ground vp aloft, and suddenly mount vp into the skie, even out of the very water: which is the cause, that if any chance to fall into those pits wherein wee take wild beasts, they alone will make good shift to get forth and escape. The Geirs or Vulturs, and for the most part all weightie and heauy fowles, cannot take their flight & flie, vnlesse they fetch their run and biere before, or els rise from some steepe place with the vantage. And such are directed in the aire by their tails. Some looke about them euery way, others bend and turne their necks, in flying: and some fly with their prey within their talons, & eat it as they fly. Most birds cry and sing as they flie, yet some there be contrariwise, that in their flight are euer silent. In one word, some flying carry their breasts and bellies halfe vp right: others again beare them as much downward. Some flie side-long and bias: others directly forward, and follow their bills: and last of all there be that bend backward as they flie, or els bolt vp right. In such sort, that if a man saw them all together, he would take them not to be one kind of creature, so diuers & different are they in their motions.

CHAP. XXXIX.

¶ Of Martinets.

Martinets, which the Greeks call Apodes (because they haue little or no vse of their feet) and others, Cypseli, are very good of wing, and flie most of all others without rest. And in very truth, a kind of Swallows they be. They build in rocks & stony cliffes. And these be they and no other, that are seen euermore in the sea: for be the ships neuer so remote from the land, saile they neuer so fast and far off, ye shall haue these Martinets alwaies flying about them. All kinds els of Swallows and other birds, do sometime light, settle, and perch: these neuer rest, but when they be in their nest. For either they seem to hang, or els lie along: and a number of shifts and deuises by themselves they haue besides, and namely when they feed.

CHAP. XL.

¶ Of the bird Caprimulgus, and the Shouelar.

The Caprimulgi (so called of milking goats) are like the bigger kind of Owls. They bee night-theeues, for all the day long they see not. Their manner is to come into the sheep-heads coats and goat-pens, and to the goats vdders presently they go, and suck the milke at their teats. And looke what vdder is so milked, it giueth no more milke, but misliketh and falleth away afterwards, and the goats become blind withall.

There be other birds named Plateæ, i. Shouelars. Their manner is to flie at those foule that vse to diue vnder the water for fish: and so long will they peck and bite them by the heads, vntil they let go their hold of the fish they haue gotten, and so they wring it perforce from them. This bird when his belly is full of shell fishes that he hath greedily deuour red, and hath by the naturall heat of his craw and gorge in some sort concocted them, casteth vp all vp again: and at leasure picketh out the meat, and eateth it again, leauing the shells behind.

CHAP. XLI.

¶ The naturall wit of some birds.

The Hens of country houses haue a certaine ceremonious religion. When they haue laied an egge, they fall a trembling & quaking, and all to shake themselves. They turne about

A also, as in procession, to be purified, & with some festiue or such like thing, they keep a ceremonie of hallowing, as well themselves as their eggs.

CHAP. XLII.

¶ Of the Linnet, Poppinjay or Parrat, and other birds that can speake.

The Linnets be in manner the least birds of all others: howbeit they be very docible. Doe they will whatsoeuer they are taught & bidden, not only in their voice, but also with their feet and bills, as if they were hands. In the territorie about Arelate, there is a bird called Taurus (because it loweth like a bull or cow, for otherwise a small bird it is.) There is another also named Anthus, which likewise resembleth the neighing of horses: and if haply by the approach of horses they be driuen from their grasse wherof they feed, they will seem to neigh; and flying vnto them, chase them away, and so be reuenged of them again. But about all other birds of the aire, the Parrats passe, for counterfeiting a mans voice: in so much, as they will seeme to parle and prate our very speech. This foule commeth out of the Indies, where they call it Sitace. It is all the body ouer Greene, onely it hath a collar about the necke of vermilion red, different from the rest of her feathers. The Parrat can skil to salute Emperors, and bid good morrow: yea, and to pronounce what words she heareth. She loueth wine well, and when shee hath drunk freely, is very pleasant, plai full, and wanton. She hath an head as hard as is her beak: when she learns to speake, she must be beaten about the head with a rod of yron: for otherwise she careteth for no blowes. When she taketh her flight down from any place, she lighteth vpon her bill, and resteth thereupon, and by that means fauoreth her feet, which by nature are but weake and feeble, and so carrieth her owne weight more lightly.

There is a certain Pie, of nothing so great reckoning and account as the Parrat, because shee is not far fet, but here-by neere at hand: howbeit, she pronounces that which is taught her more plainly and distinctly than the other. These take a loue to the words that they speak: for they not only learn them as a lesson, but they learn them with a delight and pleasure. In so much that a man shall find them studying thereupon, and conning the said lesson: and by their carefull thinking vpon that which they learn, they shew plainly how mindfull and intenuie they be thereto. It is for certain knowne that they haue died for very anger and griefe that they could not learn to pronounce some hard words: as also, vnlesse they heare the same words repeated often vnto them, their memory is so shittie, they will soone forget the same againe. If they misse a word, and haue lost it, they wil seeke to call it againe to remembrance; and if they fortune to heare the same word in the mean time, they will wonderfully ioy therat. As for their beautie, it is not ordinary, although it be not very louely. But surely amiable enough they are in this, that they can so well resemble mans speech. It is said, that none of their kinde are good to bee made scholers, but such only as feed vpon mast: and among them, those that haue fine toes to their feet. But euen these also are not fit for that purpose, after the first two yeares of their age. And their tongue is broader than ordinarie: like as they be all that counterfeit mans voice, each one in their kind, although it be in maner general to all birds whatsoeuer to be broad tongued. Agrippina the Empreffe, wife to Claudius Caesar, had a Black-bird or a Throistle, at what time as I compiled this booke, which could counterfeit mans speech; a thing neuer seen nor knowne before. The two Casars also, the yong princes (to wit, Germanicus & Drusus) had one Stare, & sundry Nightingales, taught to parle Greeke and Latine. Moreouer, they would studie vpon their lessons, and meditate all day long: and from day to day come out with new words still, yea, and were able to continue a long speech & discourse. Now for to teach them the better, these birds must be in a secret place apart by themselves, where they can heare no other voice: and one is to fit ouer them, who must repeat often that which he would haue them to learn; yea, and please them also with giuing them such meat as they best loue.

CHAP. XLIII.

¶ The vnderstanding and wit that Rauens haue.

Let vs not defraud the Rauens also of their due praise in this behalfe, considering, that the whole people of Rome hath testified the same not only by taking knowledge, but also by a publick reuenge & exemplarie punishment. And thus stood the case. In the daies of Tiberius

berius the emperor, there was a yong Rauē hatched in a nest vpon the church of *Castor & Pollux*; which, to make a triall how he could flie, took his first flight into a shoemakers shop just ouer-against the said church. The master of the shop was well enough content to receiue this bird, as commended to him from so sacred a place, and in that regard set great store by it. This Rauē in short time being acquainted to mans speech, began to speak, & euery morning would fly vp to the top of the Rostra or publick pulpit for Orations, where, turning to the open Forum & market place, he would salute and bid good morrow to *Tiberius Caesar*, and after him, to *Germanicus* and *Drusus* the yong princes, both *Caesars*, euery one by their names: and anon the people of Rome also that passed by. And when he had so don, afterwards would flie again to the shoemakers shop aforesaid. This duty practised, yea and continued for many yeres together, to the great wonder and admiration of all men. Now it fell out so, that another shoemaker who had taken the next conuiners shop vnto him, either vpon a malicious enuie that he occupied so neer him, or some sudden spleene and passion of choler (as he would seeme to plead for his excuse) for that the Rauē chanced to meut a little, and set some spot vpon a paire of his shooes, killed the said Rauē. Whereat the people tooke such indignation, that they rising in an vptore, first droue him out of that street, and made that quarter of the city too hot for him: and not long after murdered him for it. But contrariwise the carcase of the dead Rauē was solemnly entered, and the funerals performed with all ceremoniall obsequies that could be deuised. For the corps of this bird was bestowed in a coffin, couch or bed, and the same bedecked with chaplets and garlands of fresh floures of all sorts, carried vpon the shoulders of two blacke-Mores, with minstrels before, founding the Haut-boies, and playing on the Fife, as far as to the Funeral fire; which was piled and made in the right hand of the caufey Appia, two miles without the city in a certain plain or open field called Rediculi. So highly reputed the people of Rome that ready wit and apt disposition in a bird, as they thought it a sufficient cause to ordaine a sumptuous buriall therefore: yea, and to reuenge the death thereof, by murdering a citizen of Rome in that city, wherein many a braue man and noble person died, and no man euer solemnized their funerals: in that city I say which afforded not one man to reuenge the vnworthy death of that renowned *Scipio Aemilianus*, after he had woon both Carthage and Numantia. This happened the fifth day before the Calends of Aprill, in the yere when *M. Seruilius*, and *C. Cestius* were Consuls of Rome. Moreover, euen at this very present, when I wrote this historie, I saw my selfe a Crow belonging to a certain knight of Rome, who brought him out of the realm of Grenado in Spaine, which was a very strange and admirable bird, not only for the exceeding blacke colour of his feathers, but also for that he could pronounce and expresse so perfectly many words and sentences together, and learned still new lessons euery day more than other. It is not long since that there went a great bruit and fame of a notable hunter in Erizena a countrey of Asia, whose name was *Craterus Monoceros*: that vsed to hunt by the meanes and helpe of Rauens. His manner was to carry with him these Rauens into the Forrest, perching vpon his shoulders & his hunting hornes: and these would seeke out and put vp other wilde ones, and bring them to him. Thus by custom & vse he brought his hunting to this good passe, that when he returned homeward out of the forest, the wild as well as the tame would accompany him. Some haue thought it worth the setting downe vpon record, how there was a Rauē scene in time of great drought when water was hard to come by, for to cast stones into the bucket belonging to a sepulchre, wherein there was some rain water remaining toward the bottome, but so deepe, that he could not reach vnto it: and being afraid to go downe into it, by heaping vp many stones, hee brought the water to rise so high, as he might drinke sufficient with ease.

CHAP. XLIV.

¶ Of *Diomedes* his birds.

Neither will I ouerpasse the birds called *Diomedes*, which *K. Inbanameth* Catara &c. Toothed they are, as he saith, and they haue eies as red and bright as the fire: otherwise their feathers be all white. Who also affirms, that they euermore haue two captains, the one for to lead the vaward, and the other for the rereguard. With their bills they dig little trenches & gutters in the ground: ouer which from side to side they lay sticks, acrosse like hurdles,

arti-

artificially, and then couer the same ouer with the earth they cast forth before, vnder which they breed. Euery of these trenches hath two dores, the one regarding the East, at which they go forth to their meat: and the other looking toward the West, by which they come in againe after their returne. Whensoever these birds would meut, they flie euer full into the winde, because they would not file themselves. Found they be in one place of the world, and but in one, namely in a certaine Island, innobled, as we haue written before, for the tombe and Temple of *Diomedes*, and it lieth vpon the coast of Apulia. These birds are like vnto the white sea Mewes with a blacke cop. Their manner is to cry with open mouth vncessantly at any strangers that come a land, saue only Grecians, vpon whom they wil seem to fawn and make signes of loue and amitie in all flattering wise. A wonderfull thing that they should discerne one from another, and giue such friendly welcome to them, as descended from the race of *Diomedes*. Their manner is euery day to charge their throat and wings full of water, and all to drench therewith the said temple of *Diomedes*, in token of purification. Whereupon arose the fable, That the companions of *Diomedes* were turned into these birds.

CHAP. XLV.

¶ What Birds are not apt to learne, and will not be taught.

And now that we are in this discourse of wit and capacitie, I must not omit to note, That of birds the Swallow, and of land beasts the Mouse and the Rat, are very vntoward, and cannot be brought to learn. Whereas we see great Elephants ready to do whateuer they are commanded: the furious Lions brought to draw vnder the yoke: the Seals within the sea, and so many sorts of fishes grow to be tame and gentle.

CHAP. XLVI.

¶ The manner of Birds in their drinking.

Birds drinke sucking, and those that haue long necks make stayes betweene, and euery while hold vp their bil from the water, as if they would poure the water down their throat. The bird *Porphyrio* alone seems to bite the water as he drinketh. And this bird hath this pertie by himselfe, to dip and wet all his meat euer and anon in water, and then with his foot in lieu of an hand to reach it vnto his bil. The best of this kind are in Comagene. Their bills and long shanks that they haue be red.

CHAP. XLVII.

¶ Of the Fowle *Himantipus*, the *Onocrotali*, and other strange fowles.

Like in that respect vnto the *Porphyrio*, is the *Himantipus*, a bird far lesse in body, but full as long legged, and stalking as high. They are bred in *Aegypt*, and go vpon three toes to a foot. Their most feeding is vpon flies. In Italy they liue not many daies. All great & heauie birds liue on seeds and corn: they that fly on high prey vpon flesh. Among water fowles the *Cormorants* vse to deuoure that which other birds either disgorge or meute. The *Onocrotali* much resemble swans, and surely they might be thought the very same and no other, but that they haue within their throat another kind of gizzar besides their craw, in which, these fowles being vnfatiable, bestow all that euer they can get; whereby it is of a wonderfull great capacite, and will receiue very much. Now when they haue done the rauening, and filled this poke, soon after they conuey it from thence by little and little into their mouth, and there chew the cud, vntill after it be well prepared, they swallow it downe into the very craw and belly indeed. These fowles are to be found in the parts of Picardie and Normandy in France, lying vpon the North Ocean. In *Hircinia*, a Forrest of Germanie, we haue heard that there be strange kinds of birds, with feathers shining like fire in the night season. In other respects I haue nothing to say of them worth the writing, saue only they are of some name for being far fetched.

CHAP.

OF water fowls, the Phalerides are thought in Seleucia of the Parthians, and also in Asia, to be the daintiest. Likewise the Fesant hens of Colchis, which haue two ears as it were consisting of feathers, which they will set vp and lay down as they list. The Ginnie or Turkey hens in a part of Africke called Numidia, be in great request, as also throughout all Italy now adaies. *Apicius*, the most riotous glutton and belly-god of his time, taught men first, that the tongue of Phœnicopterus was a most sweet and delicat piece of meat. The Moore-hen of Ionia is much commended and highly esteemed. This bird so soon as she is taken prisoner, loseth her voice and is mute; for otherwise she is vocal and loud enough, and in old time was reputed a rare and singular bird. But now there be caught of them in Frauce and Spain, yea and among the Alps: where also the Plungecons or bald Rauens be, which heretofore were thought proper and peculiar to the Baleare Islands: like as the Pyrrhocorax [i. the red Rauens] with the yellow bill, was supposed to breed onely among the Alps: and with it the Lagopus, a daintie bird, and most pleasant in the dish. And this name it took in Greek, because it is rough footed and haired like the haire foot: otherwise all ouer white, and as big as a pigeon. Haue her out of the ground, vnder which the breedeth, you shall hardly get her to feed, neither will shee be made tame, liue the neuer so long: kill her once, the body presently wil rot and putrifie. There is another besides of that name, and differeth from Quailes onely in bignesse, for it is greater than the Quaille; and with a yellow fauce of saffron it is a most delicate piece of meat. *M. Egnatius Calvinus* gouernor of the parts about the Alps, reporteth, that he hath seen there the Ibis a bird proper to the land of Egypt.

DVring the ciuil wars between *Otho* and *Vitellius*, and namely about the time of the journey or battell of *Bebriacum* beyond the Po, there were these new birds (for so they be called still at this day) brought into Italy. Like they be to Thrushes or Mavisses, somewhat lesse than house doves, pleasant in the eating. The Baleare Isles send vs another *Porphyrio*, better than that before named, cap. 46. Where the Buzards also a kind of Hawk are held for excellent meat, and serued vp at the table. Likewise the *Vipio*, for so they call the lesser Crane. As for the fowles called *Pegasi*, headed like horses; and the Griffons, which are supposed to haue long eares and a hooked bill, I take them to be meere fables: and yet they say that the *Pegasi* should be in Scythia, and the Griffons in Ethyopia. Moreouer, I thinke the same of the *Tragopanades*, which many men affirm to be greater than the Eagle, hauing crooked horns like a ram on either side of the head, of the colour of iron, and the head only red. As touching the Birds *Syrenes*, I wil neuer beleuee there be any such, let *Dino* the father of *Clitarchus* that renowned writer say what he wil: who auoucheth for a truth, that they be in India, and that with their singing they wil bring folk asleep, and then fly vpon them and teare them in pieces. He that will giue credit to these fables, may euen as well beleuee, that dragons forsooth taught *Melampus* by licking his eares, how to vnderstand the language of birds when they chaunt and sing vpon trees, or cry and chirp in the aire. Likewise the tales that *Democritus* telleth, who nameth certain birds, of whose blood mingled together and suffered to corrupt, there is ingendred a Serpent, which whosoever eateth shall know what birds say one to another in their speech: and namely the strange things he telleth of the Lark about the rest. For verily without these fabulous lies, mens heads be occupied enough, and too much to, about the Auguries onely and pre-fages of birds, that they haue no need to busie & trouble their brains about those toies. *Homer* makes mention of certain birds called *Scopes*: but I cannot conceiue those satyrycal gesticulations of theirs like Antikes when they are perched, which so many men talke of, neither doe I think otherwise, but that these birds are out of knowledge now a daies. And therefore far better it is to write of those we know.

THEY of the Iland Delos began the cramming of Hens and Pullein first. And from them arose that detestable gourmandise and gluttonie to eat Hens and Capons so fat & enterlarded with their owne greafe. Among the old statutes ordained for to repress inordinate feasts, I find in one act made by *C. Fannius*, a Consul of Rome, eleuen yeres before the third Punicke war, an expresse prohibition and restraint, That no man should haue his table serued with any foule, vnlesse it were one hen, and no more, and the same a runner only, and not fed vp and crammed fat. The branch of this one statute was afterwards taken forth and inserted in al other acts provided in that behalfe, & went currant thorough all. Howbeit, for all the law so well set down, there was a starting hole found to delude and escape the meaning therof, namely, to feed Cocks & Capons also with a past foked in milk & mead together, for to make their flesh more tender, delicate, and of sweeter tast: for that the letter of the statute reached no farther than to Hens or Pullers. As for the Hens, they only be thought good and well ynough cramm'd, which are fat about the neck, and haue their skin plumpe and soft there. Howbeit, afterwards our fine cookes began to looke to their hind-parts about the rumpe, and chuse them thereby. And that they should make a greater shew in the platter, they slit them along the chine: and lay their legs out at large, that they might take vp the whole dresser board. The Parthians also haue taught our cooks their own fashions. And yet for all this fine dressing and setting out of meat, there is nothing that pleaseth and contenteth the tooth of man in all respects, while one loues nothing but the leg, another likes and praises the white brawne alone, about the breast bone. The first that deuised a Barton & Mue to keepe foule in, was *M. Lenius Strabo*, a gentleman of Rome, who made such an one at Brindis, where he had enclosed birds of all kinds. And by his example we began to keepe foules within narrow coups and cages as prisoners, to which creatures Nature had allowed the wide aire for their scope and habitation.

BVt in the relation and report of this argument, notorious aboue all the rest in our memorie is that platter of *Clodius Æsopus*, the plaier of Tragedies, which was esteemed worth * six hundred Sestertia. In this one charger he serued vp at the table all kind of birds that either could sing or say after a man: and they cost him six hundred Sesterces apeece. And surely it was no delight & pleasure that he sought herein to content the tooth, but only that he would haue the name to eat the resemblers of mans voice: without any consideration & regard that he had of all that great riches and reuenues of his owne, which himselfe had gotten by his tongue, and by counterfeiting the speech of others. A father verily worthie such a sonne, who as we said before, deuoured those precious pearles. And to speake a truth, it is hard to judge whether of them twaine plaid the beast more, the father or the sonne. But that it seemeth lesse pride and prodigalitie to swallow down the throat the greatest riches of Nature, than to chew and eat at a supper mens tongues, that is to say, those birds that could pronounce our language.

THE generation of birds seemes alwaies to be after one & the same manner. And yet therein is to be found some strange & extraordinarie worke. Like as there be four footed beasts known also to haue eggs, namely, the Chamæleons, Lizards, and such as we named among Serpents. Of foules, those that haue hooked claws and talons, are but barren that way, and lay few eggs. Only the Kestrell laieih foure at a time. And verily Nature hath well provided in all the kind of foules, That the mightier should be lesse fruitfull than the weaker and those that sic from the other. The Ostriches, Hens, Partridges, and Linnets, are great laiers. As touching the

the manner of their engendring, it is performed two waies: for either the female couche th downe, as doe our hens; or else stand vpon their feet, as doe the cranes. Of eggs, some be white, as those of Doues and Partridges; others, be pale and yellowish, as those of water-foule: some be spotted, as those of the Turkie-hens: others againe red; and such eggs Feafants lay, and Ketrils.

All birds eggs within the shell, are of two colours. In water-foules, the yolke is more than the white, and the same is more wan and dusky than in others. The eggs of fishes are of one colour, and therein is no white at all. Birds eggs are brittle shelled, by reason of their heat. Serpents eggs are more tough because of cold: but they of fittes are more soft and tender, for that they be so liquid. Those of fishes and such creatures as liue in water, haue round eggs ordinarily: others be long and pointed at one end in the top. Birds lay their eggs with the rounder end comming forward: their shell is soft whiles they be warm and a laying, but presently they harden by piecemeale as they come forth. *Horatius Flaccus* is of opinion, that the longer the egge is, the better tast it hath. The rounder egge prooues to be the hen commonly, the rest will be cockes. There is found in the * top or sharper end of an egge within the shell, a certaine round knot resembling a drop or a nautil, rising aboue the rest, which they call a Kinning.

CHAP. LIII.

¶ *The engendring of egges: the sitting of birds: and their manner of generation.*

Some birds there be, that tread all times of the yeare; and lay eggs but only two moneths in mid-winter: and of those, pullets lay more than old hens, but they be lesse, especially the first and last of one laier. So fruitfull they be, that some of them will lay threescore eggs ere they giue ouer: some euerie day; others, twice in one day: and some will ouer-lay, vntill they be so weary and feeble withall, that they will neuer lay more, but die withall. The little short legged grig hens, called Hadrianæ (that came from Hadria) are counted best. Doues lay, & conuey ten times in the yeare, some of them, eleuen: and in Egypt there are found that giue not ouer in the twelue months, euen at mid-winter in December. Swallows, Oufels, Quoits or Ringdoves and Turtles, lay and sit twice in the yeare: other birds ordinarily but once. Thrushes and Blackbirds build their nests of mud and clay, in trees and bushes one by another, so neere as if they were linked together: and lightly they engender in some corner out of the way. After the hen is trodden, within ten daies the eggs commonly knit within her bellie, are come to perfection & readie to be laid. Howbeit if hens haue some wrong done vnto them, or if a man chance to pluck a feather or quill from a pigeon at that time, or do them some such iniurie, it will be longer ere they lay.

All eggs haue within them in the mids of the yolke, a certaine drop as it were of bloud, which some thinke to be the heart of the chicken, imagining that, to be the first that in euerie bodie is formed, and made: and certainly a man shall see it within the verie egge to pant and leape. As for the chick, it taketh the corporall substance, and the bodie of it is made of the white waterish liquor in the egge, the yellow yolke serues for nourishment whiles the chick is vnatched and within the egge, the head is bigger than all the bodie besides: and the eies that be compact and thrust together, be more than the verie head. As the chick within growes bigger, the white turneth into the middest, and is enclosed within the yolke. By the 20 day (if the eggs be stirred) ye shall heare the chick to peepe within the verie shell: from that time forward, it beginneth to plume and gather feathers: and in this manner lies it within the shell, the head resting on the right foot, and the same head vnder the right wing, and so the yolke by little and little decreaseth and faileth. All birds are hatched with the feet forward, contrarie to other creatures. Some hens there be, that lay all their eggs with two yolkes; and of them be hatched two chickens otherwhiles, as *Cornelius Celsus* writeth, but the one of them is bigger than the other. Howbeit, others say, it is impossible that one egge should come to two chickens. Moreover, it is held for a rule, that where should not be put vnder a brood-hen aboue 25 eggs at one time to sit vpon. After the mid-winter, hens begin to lay and sit. The best brood is before the spring Equinoctiall. Those that be hatched after mid-summer, neuer come to their full and kind bignesse: and euermore the later the lesse.

CHAP.

CHAP. LIV.

¶ *The infirmities and impediments incident to brood hens, and the remedies.*

The best eggs that can be put vnder hens when they sit, are they that were laid ten daies before at the utmost; for neither old eggs, nor yet very new laid are good for that purpose.

After that a hen hath sitten 4 daies, take an egge from vnder her, hold it in one hand by the narrow end, and look between you and the light, with the other ouer it; if it be cleare through and of one colour, it is supposed to be naught, and will neuer proue a chicke, and therefore put another in place thereof. Another experiment there is by water: the addle egge will flote aboue

as empty, the found and good will sinke to the bottom: and such therefore being full are to be set vnder the hen. We ye would try whether an egge be good or bad in this case, our country wiues say, you must not shake them in any hand, for if the vital veins & parts be broken & blended together, they will neuer proue. Moreover, this is alwaies to be looked vnto, that ye begin to set an hen after the change of the moon, for if you set her in the wain, the eggs will be addle, and neuer come to be chickens. The warmer the weather is, the sooner will she hatch, & therefore it falleth out, that in summer ye shall haue her abroad with her brood vpon the nineteenth day, in winter many times it will be 25 daies first. If it thunder while she is broody the eggs will be addle; yea and if the hen chance but to heare an hawke cry they will be marred. The remedie against thunder, is to put an iron nail vnder the straw of the hens nest, or els some earth

newly turned vp with the plow.ouer and besides, there be some eggs that will come to be birds without sitting of the hen, euen by the worke of Nature only, as a man may see the experience in the dunghills of Egypt. There goeth a pretty yeast of a notable drunkard of Syracusa, whose manner was when hee went into the Tauerne to drinke, to lay certaine egges in the earth, and couer them with mould, and he would not rise nor giue ouer bibbing vntill they were hatched: To conclude, a man or woman may hatch eggs with the very heate only of their body.

CHAP. LV.

¶ *The Auguries and presages of Egges.*

Livia Augusta the Empreffe, wife sometime of *Nero*, when she was conceived by him, & went with that child [who afterwards proued to be *Tiberius Casar*] being very desirous (like a yong fine lady as she was) to haue a jolly boy, practised this girlish experiment to fore-know what she should haue in the end: she tooke an egge, and euery carried it about her in her warme bosome; and if at any time she had occasion to lay it away, she would conuey it closely out of her owne warme lap into her nurses, for feare it should chill. And verily this presage proued true, the egge became a cocke chicken, and she was deliuered of a sonne. And hereof it may well be come the deuice of late, to lay egges in some warme place, and to make a soft fire vnderneath of small straw or light chaffe to giue a kinde of moderate heate: but euermore the eggs must be turned with a mans or womans hand, both night and day; and so at the set time they looked for chickens and had them. It is reported besides of a certaine Poulter, who had a secret b. himselfe, whereby he could tell surely and neuer misse, which egge would be a cocke chicke, which a hen: also of many hennes that he kept, which was euery hens egge, if hee did but see it. We haue heard moreover, that when a brood hen chanced to die, the cocks that vsed to tread her, were seen to go about with the chickens one after another by turnes, and to do euery thing like to the very hen indeed that hatched them: and all that while to forbear once to crow. But aboue all it is sport alone to see the maner of an hen that hath sitten vpon ducks eggs and hatched them, how at the first she will wonder to haue a teem of ducklings about her, and not acknowledge them for her owne; but soone after shee will clucke and call this doubtfull brood to her very carefully and diligently: but at the last, when she perceiues them, according to their kind, to take the water and swim, how she will mourn and lament about the fish-pool, that it would pittie ones heart to see them what moane they will make.

CHAP.

CHAP. LVI.

¶ Which be the best hens.

A Man shall know a good and kindly hen by her comb, when it is strait and vpright: otherwhiles also double crested: also by the pinion feathers blacke, the vpper plume reddish. Such a hen will be red also about her head and bill, and haue an odde toe to her feet, yea and somtime that od one to lie crosse ouerthwart the other foure. In case of sacrifices and religious vse they are not thought good nor allowable that haue beck and feet yellow. For diuine seruice and secret mysteries celebrated in couert to the goddesse Ops, the black are allowed for good. There is also a dwarfish kind of hens, [*i. grig hens*] that are extraordinarie little, and yet fruitful, a thing not seen in any other kind of fowle: they lay and misse not, but seldom sit they on any eggs, and if they do it is hurtfull for them.

CHAP. LVII.

¶ The maladies that hens be subiect vnto, and the remedies.

That which troubleth all the kind of them is a certain distillation of a phlegmaticke humor, which causeth the pip, the most of all between haruest time and vintage. The cure is, to keep them hungry & long fasting: also to let them lie or perch in a smoky place, especially where the fume is made of Bay leaues and the herb Sauin. It is good moreouer, to draw a little quill or feather through their nostrills acrosse, and to remoue or shift it euery day. As for their meat, let it be some cloues of garlicke shred among their corne, or else let their meat bewell infused or steeped in water, wherein an owle hath washed and bathed her selfe; or else foddren with the seed of Bryonic or the wilde white Vine: besides such other medicines as are daily in vse.

CHAP. LVIII.

¶ The manner how fowles do conceiue, and what number of yong ones commonly they hatch.

Doues haue this propertie by themselves, to bill one another and kisse before they tread. They lay for the most part two eggs. Thus Nature hath disposed, that some should breed often and few: others should hatch many together at once. The Ringdoves or Quois, and Turtles, ordinarily lay three eggs; and lightly they sit and hatch but twice a yere: and that is, if their first brood come not to perfection, but miscarried and was not reared vp. And albeit they lay three eggs, yet they neuer hatch but twain: the third that is addle, they call in Latine *Vrinum*. The female Ringdove sits euer from noon vntill the next morning; the male makes vp the rest of the day. House-doues breed euermore one cock pigeon, and another hen. The male is hatched to day, and the female tomorrow. In that kind they sit both, the cock all day, and the hen by night: and vsually vpon the 20 day they hatch. They lay within fise daies after they be troden, and in summer time verily you shall haue them in the space of two months bring three paire of pigeons; for then they vse to hatch by the 18 day: and presently they conceiue again. So that a man shall oftentimes find new laid eggs euen amongst the young pigeons: and otherwhiles it is seen, that whiles some are ready to fly, others peep newly out of their shel: and these yong birds within fise moneths will lay themselves. Now the nature of these hen doues is (if they want a cock) to tread one another, and hereof they come to lay barren eggs, wherof nothing will be ingendred: and such the Greeks call Hypenemia, *i. wind-eggs*.

CHAP. LIX.

¶ Of the Peacocks and Geese.

The Pea-hen falls to lay and breed after she is 3 yeres old. In the first yere she begins with one or two eggs: the yere following she riseth to foure or fise: in the rest she reacheth to twelue and no more. When she layeth, her manner is to rest two or three dayes betwene euery egge. And thrice a yere she keepeth this order, namely, if her egges be taken from

A from her, and put vnder hens to be sitten vpon: for why, the Peacocks will break them if they can meet with them, because they canot misse and spare the Peahens company while they are broody and sitting: which is the cause they are wont to lay by night, or in some secret corner out of the way, and that from an high place where they perch: and then, vnlesse there be good heed taken that the eggs be latched in some soft bed vnderneath, they are soone broken. One Peacock is sufficient to go with fise wiues: for when there is but twain [*the villaine is so lecherous*] with ouermuch treading he hindereth their laying, and marreth the knot of eggs ingendred within them. The Peahen hatcheth in 28 daies, or in thirty at the farthest.

B Ganders and Geese ingender together in the very water. Geese lay ordinarily in the spring: or if they were troden about mid-winter, then ye shall haue them lay after the Winter Sunne: stead some forty daies or very neere. They haue vsually two laiters in the yere, namely, if hens hatched their former eggs. The most that they hatch at one sitting is sixteene, and the fewest fien. If a man steale their eggs from them they lay still, and neuer giue ouer till they be readid to burst with laying. No birds eggs but their own will they hatch. The most profitable way, is to set them vpon nine or eleuen. The females only sit, and that for the space of 30 daies, vnlesse it be warme weather, and then they will haue done by 25. If one of their Godlings be stung neuer so little with a nettle, it will die of it. Their owne greedy feeding also is their bane, for one while they will eat vntill they burst again; another whiles kill themselves with straining their own selues: for if they chance to catch hold of a root with their bill, they will bite and pull hard for to haue it, that many times they breake their owne neckes withall, before they leaue their hold. Against the stinging of nettles the remedie is, that so soone as they be hathed there be some nettle roots laid vnder their nest of straw.

CHAP. LX.

¶ Of Herons and Bittours, and the best way to keepe eggs long.

DOF Herons be three sorts, * Leucon, * Asterias, * and Pellon: these last ingender with much paine and difficultie; as for the males verily they cry againe for anguish, and the bloud starts out of their eies in the act of treading. And with as much ado and trouble do the females lay, after they be knit with eg. The Eagle and the most part of the greater fowls sit 30 daies, whereas the lesse continue but 20, as the Kite and the Hawk. The Kite vsually hatcheth but one at a time, and neuer aboue three: but that kind called *Egoliol* somtimes foure. The Rauens also now and then fise: and those couoe as many daies. While the female crow sits the male feeds her. The Piot ordinarily brings forth nine Piannets, the fig-pecker *Melanocoryphus* aboue 20, but euermore an od one: and there is no a bird that goeth therein aboue her. Lo how Nature is willing to multiply the race of little birds! The yong Swallowes are at the first blind, and so are all such as are hatched many in number. Wind-eggs, which we call *Hypenemia*, come either by the mutuall treading of hens one another, by an imaginarie conceit of the male, or else by dust. And such eggs not only Doues doe bring, but house Hens also, Partridges, Peahens, Geese, and Brants, or the female Barganders. Now these eggs are barren as it were, and neuer proue birds, lesse than others, not so pleasant in taste, and besides more moist. Some are of opinion that the wind will ingender them, for which cause also they are called *Zephyria* [*i. West-wind eggs*]. And verily such eggs are seen only in the spring, when that wind blows. Addle eggs, which some called *Cynosura*, are they that chill vpon the rest, when the hen is gone and giueth ouer sitting. Eggs steeped in strong vineger will come to be so soft, that they will passe and be drawn through the ring of a mans finger. The best way to keep egges is in beane meale or floure; and during winter in chaffe, but for summer time in bran. It is thought if they lie in salt their substance will waste and consume to nothing within the shell.

CHAP. LXI.

¶ What Bird alone bringeth forth a lining creature, and feedeth it with milke.

The Rere-mouse or Bat alone of all creatures that fly, bringeth forth yong aliue, and none but she of that kind hath wings made of pannicles or thin skins. She is the only bird that suckleth

* A Criell, or
dwarfe Heron.
Bittor.
* A Carion
Heron

suckleth her little ones with her paps, and giues them milk: and those she wil carry about her two at once, embracing them as she flieth. It is said also that she hath no more but one ioynt of the hanch, without any in the knee or feet: and that they take greatest delight to feed vpon gnats.

CHAP. LXII.

¶ Of Vipers: their manner of generation and bringing forth yong: and what land beasts do lay eggs.

Moreouer, among creatures of the land, serpents lay eggs: whereof as yet we haue not written. As they ingender together they clip and embrace, and so intangled they be and in-wrapped one about the other, that a man who saw them would think they were one serpent with two heads. In the very act of generation the male Viper thrusteth his head into the mouth of the female; which she (for the pleasure and delectation that she hath) gnaweth and biteth off. No land creature els but she hath eggs within her belly, of one colour and soft, like as fishes haue. Now after three daies they be quicke, and then come forth as they be hatched, but no more than one at once euery day: and so commonly she hath. When she is deliuered of the first, the rest (impatient of so long delay) eat through their dams sides, and kil her. As for other serpents they lay their eggs linked and chained together, and so sit vpon them on the land: but they hatch them not vntill the yeare following. Crocodiles sit by turnes, the male as well as the female. But I thinke it good to treat also of the generation of other land creatures.

CHAP. LXIII.

¶ The generation of lining creatures vpon the land.

Of all liuing creatures two footed, a woman onely bringeth forth her yong quicke. Men and women both, and none but they, repent at first the losse of their maidenhead. A very preface (no doubt) of a life to ensue full of trouble and miserie, that thus should begin with repentance. All other creatures haue their set times and certain seasons in the yeare when they ingender, as hath bin shewed before: but all is one with vs, and no houre of day or night comes amisse. Other creatures know when they haue enough, and rest satisfied: we only are insatiable that way, and cannot see to make an end. The Empreſse *Messalina*, wife of *Claudius Caesar*, thinking it the only victorie for a lady and queen to excell in this feat, chose the most gallant curtisan and commonest strumpet in all Rome, to try maisteries and to contend with for the best game: and in very truth shewon the prize; for in the space of 24 houres she out-went her [a beastly thing to be written] no fewer than 25 times. As for men, they haue deuised in the practise of this filthy act, even to abuse some parts against kind: and women (vnnatural as they be) haue the cast to destroy within them the vnripe and vntimely fruit of their own body. *Ceres* in this behalfe how much worse are we than the wild and sauage beasts of the field. *Hesiod* writeth, that men are more giuen to lust in winter than in summer, and women contrariwise. Elephants, Camels, Tigers, Onces, Rhinoceros, Lions, Hares, Connies, and generally all beasts which haue their genitall parts from-ward, turn taile to taile to the female in the act of generation. As for Camels, they go into the desert, or at lestwise seeke some corner when they would ingender; and dangerous it is for one to take them in the manner. They continue in this action one whole day together, and so do none els that are whole hoofed. In foure footed beasts the males are set into the heat of lust by senting and smelling. Dogs and Bitches, Seales & wolues likewise turn away, and in the mids of the action be tied one to another euen against their wils, and cannot help it. The females of most of these before named begin to ride the males first, for to prouoke their lust: but of the rest, the males leap the females at the first. Beares (as we sayd before) lie along both as man and woman. Hedge-hogs stand both vpright, and claspe one another when they ingender. The he Cat standeth on his feet, and the she lieth vnder him. Foxes ly vpon their sides, and so the Bitch embraceth the male Fox. Kine and Hindes cannot well endure the violence of the Bulls and the Stagges in this businesse, and therefore they are euer going when they doe engender. Stagges goe from one Hinde to another, and then come againe to the first; and this doe they in course. Lizards, as all other creeping creatures that haue no feet, wind one about another as they ingender. The greater that any beasts be, the lesse fruitfull

A fruitfull they are of their bodie. Elephants, Camels, and Horses, get but one at once, neither do the females beare any more at a time: whereas the Goldfinch or Linnet, a verie little bird, bringeth forth a dozen commonly at once. Such as bring most, are least while in breeding. The greater that any creature is, the longer time it requireth to be formed in the mothers wombe. And such as liue long, be longer also ere they haue their perfection and come abroad into the world. The growing age is not meet for generation. Beasts that are whole hoofed, neuer bring but one at a time: such as be clouen footed in twaine, may also haue twins. But as many as haue their feet parted and deuised into many toes, are fit to beare many at ones. And whereas all the former rehearsed, bring forth perfect creatures with all parts, some haue their young ones imperfect and but halfe made: in which number Lionesses, she Beares, bitch Foxes, are to bee reckoned: but especially the she Beares, whose whelpes are more vnshapen than the rest: and a rare thing it is to see them a whelping. Howbeit such females when they be deliuered of them, with their licking do chafe and heat them, and so by little and little bring them to some forme and fashion by this meanes. Such for the most part beare foure whelpes. As for bitches, Wolues, Panthers, and Thoes, kindle their young before they can see.

B Of Dogges and Bitches there be many kinds. They of *Laconia*, as well the male as the female, be apt to engender after they be eight months old. They be with whelp three score daies and three ordinarily. As for other Bitches, they goe proud at fixe moneths, and may be lined. They be all the sort of them, sped at the first lining, Bitches that go assaured and take the dog before the full time, namely when they be verie young, such bring a litter that will be longer ere they see: neither goe they: but all the whelps will not be blind so many daies. Dogs commonly when they be halfe yeare old, are thought to lift vp their leg when they pisse, and that is a signe they are come to their full strength and perfection: but bitches all that time pisse sitting vpon their buttocks. They haue twelue whelps when they bring most, but ye shall see them commonly with a litter of six or nine: and sometime they come with just one, but that it is thought to be a prodigious signe, as also if the whelpes be all Dogges or all Bitches. The first vsually that they whelp, be Dogs; for the rest, they be one with another, a Dog and a Bitch: namely, if they were lined in the due season, and at the just moneth. And commonly they goe proud fixe moneths after their former litter. The Bitches of *Laconia* ordinarily bring eight at a time. The Dogs of this race haue a propertie with them, that the more they be traueled, the more lustie and fresh they are, yea and the hotter after salt-bitches. They liue ten yeares, and the Bitches twelue. Of other kinds, ye shall haue them continue fifteen yeares, yea and otherwhiles twentie: but they engender not so long, but giue ouer commonly at twelue.

C Cats and Rats of *Inde*, called *Ichneumon*es, in all other respects follow the Nature of Dogs, saue that they liue but six yeares. Conies kindle euery moneth: and albeir they be bagged, yet will they take the bucke againe, and conceiue vpon it, like as the Hares also will doe the same: for as soon as euer they haue kindled, they go to bucke and are present ly sped: and say that the Leuerets or Rabbits lie sucking at them yet wil they be with yong. When they be new kindled, they cannot see.

D Elephants (as we haue already said) neuer bring but one at once, and that commonly is as big as a Calfe a quarter old. Camels goe a whole yeare. After they be 3 yeares old, they are sufficient for to engender: and commonly they come in the spring: and it is a yeare after before they be couered againe. As for Mares, if there be three daies betweene, or but one, after they haue soled, it is thought they may very well be couered againe; yea and they are brought perforce to the stallion for this purpose. It is supposed also, that the shee Asse within seuen daies after, will soonest conceiue. It is a rule, to share and clip a Mares maine, before shee will abide the couering of an Asse, so vile and base a beast: for so long as the haire of her maine is well growne, she is so proud and glorious, that she will not abide the Asse to come neare her. So soone as they be couered and sped, they run full into the South or North-wind, according as they be conceiued either with male or female: a thing that no other beasts besides, doth. And then, suddainly they change their colour; for their haire will be redder, or at leastwise fuller and deeper, what colour soeuer it be. By which signe it is knowne they are with sole, and then they will admit no stallions vnto them, would they neuer so faine. And say, that some of them haue soles running by their sides, they will doe their deed at worke neuertheless: nay when they be with sole, they will labour as well as they did before: in so much, as many times they

* Resembling our English mastiues.

Reale a soling, before their master beware that they are with sole. We haue read in Chr onicles, that *Echecraides* the Thesſalian had a Mare, which euen then when she was gone far with sole, woone the best game in the Olympian race. They that haue sought more narrowly into the secrets of Nature, say, That stone-Horses, Dogs, and Bores, desire the females in a morning: but Mares, Bitches, and Sows make meanes to the male after noone. Mares that are kept within house at rack and manger with hay and prouender, desire to be couered threescore daies before those that goe abroad in the heard. Swine alone of all creatures when they be brimming, froth and some at the mouth. And as for the Bore, if he heare the grunting of a Sow that seekes to be brimmed, ynlesse he may come to her, will forsake his meat, vntill he be leane and poore: and she againe will be so far enraged, that shee will be readie to run vpon a man and all to teare him, especially if his cloths be white. But this rage and woodnesse of hers is asswaged and allayed, only with bathing her share behind with vineger. Some thinke there be certaine meats will prouoke beasts to fleshly lust, namely, Opions giuen in meat to a beast; like as Rocket to a man or woman. Moreouer, it is supposed, that whatsoeuer is made tame, which by kind was wild, the same will not breed, as Geese and Ganders. In like manner, wild Swine & red Deere, if they be tamed; or if they doe, it is very long first: and such only as were brought to hand euen from the time that they were very yong. Finally, this one thing is strange and wonderfull, that all four-footed beasts, saue only the Mare and the Sow, if they find themselves to be with yong, driue the male from them. But the Connie and the Hare alone will conceiue again when they be gone with yong.

CHAP. LXIII.

¶ *The varietie in liuing creatures, as touching their comming into the world.*

Whatsoeuer haue quicke creatures within them, bring the same forth with the head forward. For when the time is come, the yong thing turns about a little before, which otherwise lay streight out at length in the bellie. Four-footed beasts, whiles their dams go with them, lie with their legs stretched along, close vnto their own bellies. An infant whiles it is in the mothers wombe, gathereth round into a ball, and hath his nose lying just betwene his two knees. As for false conceptions or Moone-calues (whereof we spake before) some thinke they are engendered of the womans seed only: namely, when she is not conceiued by a man, but by her selfe: and hereupon it is, that the said conception hath no vitall nor animall life, because it proceeds not of the conjunction of male and female birth. True it is, that it is endued with a certain vegetatiue power, to be nourished and to grow, like as we see intrees and many other plants.

CHAP. LXV.

¶ *The breed of Mice and Rats.*

Of all creatures that bring forth their young perfect, Swine only farrow one Pig and two Pigs at a time, yea, and sometimes a number of them. Also they alone contrarie to the nature of all those that either be whole-hoofed, or clouen-footed in twaine, bring a number of yong ones at one farrow. But about all, Mice and Rats for fruitfulness do passe. And therefore I cannot put off the discourse of them any longer: and yet therein I must follow *Aristotle* for mine Author, and the report withall of the souldiers that serued vnder *Alexander* the great. It is said that they engender by licking, without any other kind of copulation: and that one of them hath brought six-score at a time: also that in Persia there haue been young Mice found with yong, euen in the bellie of the old dam. And some are of opinion, that they will be bagged, if they tast but of a little salt. Why should wee then wonder any more how such multitudes of field-Mice and Rats should come to deuour whole fields of corne? Howbeit, the reason is not yet known, how such numbers of them should al of a sudden consume away & come to nothing. For neither bee they found lying dead about ground, neither can any man come forth and say, that he hath turned vp any one with his spade as he digged in the Winter. The country of Troas is mightily giuen to breed great store of them, insomuch, as they haue forced already the inhabitants to abandon the place and depart. Men say, that the season proper and

A and agreeable for their breeding in such abundance, is a great drought: also, that when they are toward their end, there be little wormes breeding in their heads that kill them. The Mice and Rats of *Aegypt* haue hard haire and prickly like to hedge-hogs. They go likewise vpriight on their hinder feet, and walk as if they were two footed, after the manner of those in the Alps. Moreouer, if beasts of diuers kinds ingender together, they may wel breed yong between them, in case they do agree and jump in the time that the females of both should go with yong. It is commonly thought and belceued, that among foure footed beasts the Lizard hath eggs within her, and deliuereth them at her mouth; but *Aristotle* flatly denieth it. Howbeit they fit not vpon them when they haue so done, as being forgetful where they laid them, so little or no memorie at all haue they. And therefore the yong Lizards of themselves breake forth out of the shell.

CHAP. LXVI.

¶ *Of a Serpent ingendred of the marrow of a mans back bone.*

I Haue heard many a man say, that the marrow of a mans backe bone will breed to a Snake. And well it may so be, for surely there be many secrets in Nature to vs vnknown, and much may come of hidden causes, as we may see euen among foure footed beasts.

CHAP. LXVII.

¶ *Of the Salamander.*

C. AS for example, the Salamander made in fashion of a Lizard, marked with spots like stars; neuer comes abroad and sheweth it selfe but in great shewres: for in faire weather he is not seen. He is of so cold a complexion, that if he do but touch the fire, he wil quench it as presently as if ice were put vnto it. The Salamander casteth vp at the mouth a certaine venomous matter like milke, let it but once touch any bare part of a man or womans body, all the haire will fall off, and the part so touched will change the colour of the skinne to the white morpew.

CHAP. LXVIII.

D ¶ *Of those that breed of others which neuer were ingendred. Also of those that being ingendred, yet breed not.*

SOME creatures there be that breed of those that neuer were ingendred themselves; and yet not according to those naturall means as others which wee haue shewed before; and such also as either the Summer or Spring, or some certain season of the yeare do breed. Among which some ingender not at all, as the Salamander: * for there is no more distinction of sex in them, than in Yeeles, and in all those which neither lay eggs, ne yet bring forth any liuing creature. Oisters likewise and all such creatures as cleaue fast either to rockes or to the shelles, are neither male nor female. As for such as come of themselves, if there be seene in them any distinction of male and female, something verily they ingender betwene them; but an imperfect creature verily it is, and not resembling them: neither doth that generation breed ought any more, as we see the flies that ingender certain little wormes. The experience hereof is better to be obserued in those creatures called Insects: whose nature is hard to be expressed, and yet I haue appointed a severall treatise for them apart. Wherefore I will go forward in the discourse begun already, and namely as touching the sence and vnderstanding of the forenamed Creatures, and then proceed to the rest.

CHAP. LXIX.

¶ *The outward senses of Liuing Creatures.*

F AN excelleth all other Creatures, first in the sence of feeling, and then of tasting: In the rest many beasts go beyond him. For the Eagles haue a clearer eie-sight, the Geires a finer smell; and the Moldwarps, notwithstanding they be covered ouer with earth (so haueie,

beaue, so thick and deafe an element as it is) yet their eare is far better than ours. Moreouer, albeit the voice of all them that speake about ground doth ascend vward still from them, yet heare the: when they talke, yea and if a man chance to speake of them, some hold that they vnderstand their speech, and thereupon do fly from them. A man, who at first lacketh his hearing, wanteth also the vse of his tongue: neither are there any deafe borne, but the same likewise be dumbe. A man would not think, neither is it likely, that the Oysters in the sea do heare, and yet vpon any noyse and sound their manner is to sink down to the bottome. And therefore when as men do fish for them in the sea they are as silent as they may be.

CHAP. LXX.

¶ *A discourse, That fishes both heare and also smell.*

Fishes verily haue no eares, ne yet any holes to serue for hearing; and yet plain it is that they doe heare, as we may daily see in certaine fish ponds and stewes where fishes be kept: for when those that haue the charge of them make a noyse with clapping of their hands, as wild as they be otherwise, they shall haue them come in great flocks to take their meat that is thrown in to them: and this are they wont to do daily: and that which more is, in *Casars* Fish-pooles a man may see whole skuls of fishes to repaire at their call: yea, and some wil part from the rest of their company, and come alone to land when they be named. Hereupon it is, that the Mullet, sea-Pike, Stock-fish, and Chronius, are thought to heare best of all others, and therefore liue very ebbe among the shelues and shallows. That fishes haue the sence of smelling it is manifest: for they are not all taken ne yet delighted with one kinde of bait: and this is obserued, that before they bite they will smell to it. Some also there be that lie in holes vnder rocks, and no sooner hath the fisher besneared and anointed the mouth and sides of the said rocks in the very entrance to their holes, but he shall see them come forth, as it were to auoid the sent of their own carion. Let them lie in the very deep, yet wil they resort to certain odors and smells, namely, to the Cuttill burnt, and the Polype, which for that purpose they vse to put into their nests. And verily they cannot abide the smell of the sinke and pumpe of a ship, neither wil they come neere vnto it: but about all things they may not away with the bloud of fish. The Pourcuttle hardly or not at all can be pulled from the rocks, so fast cleaueth he: howbeit come neer him with the herb Marjerome or Savorie, he will presently leape from the rocke and away, to auoid the sent thereof. Purples also be caught by means of some sinking bait. And for other creatures, who doubteth but they haue a perfect smell? Serpents are chased away with the sinell and perfume of the Harts horn; but about all, with the odor of Styax. And Pismires are killed with the very fume of Origon, Quick-lime, or Brimstone. Gnats loue all four things, and willingly will thither: but to any sweet meats they come not neare.

CHAP. LXXI.

¶ *That the sence of feeling is common to all lining creatures.*

There is not a lining creature throughout the world but hath the sence of feeling, though it haue none els: for euen oysters and earth-wormes, if a man touch them doe evidently feele. I would think also that there is none but tasteth as well as feelles. For what should the reason esse be, but some desire to tast this, others that? And verily herein is seene about all the singular workmanthip of Nature, in the frame of their bodies and the members thereof. Some ye shall haue to seise vpon their prey with their teeth, others snatch it with their talons and claws: some peck and pluck it with their hookt bills, others pudder into their food with their broad nebs. Some with the sharp point of their beaks worke holes into their meat; others lie sucking at it. Some lick, others sup in: to conclude, some chew, others swallow and deuoure whole as it is. As touching their feet, there is no lesse varietie in the vse thereof: in snatching and carrying away, in tearing and plucking a pieces, in holding fast, and in crushing their prey. Some ye shall haue to hang by their feet, and others neuer lin scraping and scratching the earth.

CHAP.

CHAP. LXXII.

¶ *What creatures liue of poison, and what of earth.*

ROE Bucks and Does, yea, and Quales (as we haue said before) will feede fat with poisons; and yet they are the most meeke and gentle creatures liuing. Serpents haue a great desire and loue to eggs, wherein the subtilty of Dragons is worthy to be considered. For either they swallow them downe whole (if their throat will receiue them) and after they be within their body, breake and squeeze them in pieces with rolling and winding themselves round together, and then cast vp the shels againe: or if they be but young ones yet, and not so strong as to gobble vp whole eggs, then they will winde about an egge with their taile by little and little, & bind it so hard, that the will cut off the crowne of it, as it were with a knife, and then sup off the rest which they clasp and hold fast between. In like manner deale they with birds. For swallow they will them whole downe the gullet, and afterwards straine and struggle so with themselves untill they disgorge againe the feathers and bones that were in their bellies.

Scorpions feede vpon earth. And Serpents againe, if they may come hand somly to wine, will make means to drinke their fill of it, how soeuer otherwise they haue but little need of any drinke. They eat no meat at all, or very little, when they be kept close within any thing: like as the spiders also, which otherwise naturally liue by sucking. And therefore you shall not lightly see any venomous creature die either of hunger or thirst. For neither haue they store of heat, nor plenty of bloud, ne yet of sweat: all which naturally prouoke a stomack, & giue an edge to appetite. And among these venomous creatures, those be euer more dangerous which haue eaten some of their own kind, before they bite or sting. Apes, Monkies, and Marmosets bestow and treasure vp the meat that is giuen them, or that they can come by, within their cheeks, as in a store-house. And when they be hungry, they get the same forth by little and little with their hands, & so sal to chew it. Thus practise they in making their prouision, for to serue them from day to day, and from one houre to another: which Pismires vsually do from yeare to yeare.

CHAP. LXXIII.

¶ *The meat and drinke of some creatures.*

OF all lining creatures that haue many toes in their feet, the Hare alone feeds vpon grasse and greene corae in the blade. As for those that be whole hoofed, they liue both of the blade, and also of the fruit thereof. Also of such as be clouen footed, Swine will eat all kind of food, yea, and liue of very roots. It is the property of whole hoofed beasts alone, to wallow and turn ouer and ouer. All that haue teeth indented in like saws, be naturally deuourers of flesh. Bears will feede of corn, brouse trees, eat grapes, liue of apples and other fruits, feede vpon bees, crefishes, and pismires. Wolues (as we said before) if they be very hungry, eat earth: sheep feede the better & grow fat, if they may drinke; and therefore salt is very good for them, because it makes them thirsty. Draught beasts, and such as are vsed for carriage, albeit they liue of corne and grasse, yet according to their drinke they do feed. Besides those mentioned hertofore, of wild beasts the red and fallow Deere both, doe chew cud when they be made tame and fed by hand: but all chuse rather in so doing, to lie than to stand, & in winter more than in summer, for seven months ordinarily. The rats and mice in the country of Pontus, namely, Hermins, & such like, after the same manner do chew cud and go ouer their meat again. What beasts soeuer are toothed like saw teeth, lap as they drinke. So do also our common mice and rats, although they be of another kind, and are not so toothed. They that haue broad teeth, plaine, and vniforme, as horses and kine, drinke supping and taking their full draught. Bears in their drinke do neither the one nor the other, but bite at the water and so let it down. In Affrick the more part of wild beasts drinke not all summer long, for want of raine water: which is the cause that the Rats and Mice of Ginnie which be taken if they drinke afterwards vpon so long disuse, die therewith. In the deserts of Affrick, where there is no water euer to be had, there is ingendred a certain wilde goat named Oryx, which as by the nature of the place it wanteth drinke, so it hath in her bodie a fouerain and singular remedy against drought and thirst. Which the common theues & robbers by the high way side in Getulia, knowing well enough, endure a long time with the helpe thereof.

thereof without drinke, for they vse to stanch and quench their own thirst, with a certain moist holefome liquour found in the bladders of the said beast. In the same Affricke the Leopards lie in await among the thickets of trees, hidden within the branches; and so seize vpon them that passe by, and make spoile euen from the place where fouls vse to perch. As for Cats, marke I pray you how silent they be, how soft they tread when they steale vpon the silly birds: how secret lie they in espiall for the poore little mice to leap vpon them. Their owne dounge and excrements they will rake vp and hide in the earth, knowing full well, that the smell thereof will bewray where they are.

CHAP. LXXIII.

¶ What beasts accord together, and which they be that disagree one from another.

H

Besides these outward fences abouenamed, euident it is also, that brute beasts haue other instincts of nature. For they entertain friendship and enmity one with another (which cannot be without affection and passion) ouer and besides those other wars and amities which wee haue obserued in their seuerall places. Swans and Eagles jar and war one with another: so doth the Rauens and the Witwall or Lorio, which seeke after one anothers eggs in the night. Likewise the Rauens and Kite: for the Rauens is euermore ready to catch the Kites meat from him. Crows and Owles are at mortall feud one with another. The roiall Eagle hateth the Wren, and why? because (if we may beleue it) he is named Regulus (i. the pettie king.) Howlets also cannot agree with other little birds. Again, foules make warre with foure-footed beasts. The Weasell and the Crow be at deadly debate. The Turtle with the Creckit (Pyralis) that liueth about the fire. The Ichneumons with Wasps: the Phalangia with other Spiders. And among water foules, Ducks and Drakes with the sea-gulls. The Seamews with the Buzzard Triorchis. As for the field Rats or Mice, and the dwarf-Herons, they seeke to prey one vpon the others little ones. The bird Egithus (the least in maner of all others) waiteth the Asse a shrewd turn; for when he rubbeth himself against the bushes to scratch where it itcheth, he therewith breaketh and ouerthroweth her nest; and therefore this silly bird is so much afraid of the Asse, that if she heare him but bray, she is ready to throw the eggs out of her nest, and those that be already hatched, will for very feare fall downe: then in reuenge of this wrong, she will flie vpon him, and with her bill peck where the skin is off and raw with rubbing, yea, and make holes euen to the very bone. Moreover, Foxes and the Yeoles of Nilus cannot abide one another, but are in continuall war. So be Wezils and Swine. There is an vnhappy bird called Esalon, and but little withall; yet will she squash and breake the Rauens eggs. And when she hath yong ones, they bee much troubled and annoied with Foxes: she again to be quit with them, will all to pinch & nip both the Fox and her cubs. The Rauens seeing that, come to aid (as it were) against a common enemy. The Gold-finch liueth among bushes and thorns, and therefore she also hates the Asse, because he eateth vp the floures that grow therupon. The bird Egithus, so far hateth another called Anthus, that men are verily persuaded the bloud of them both will not mingle together: and hereupon it is, that the forcerers and witches haue brought it into an ill name. The Thoes and the Lions do fouly jarre and disagree. In summe, the least creatures as well as the biggest quarrell and fight one with another. Rats and field Mice cannot abide to comeneere a tree that is full of Ant-nests. The Spider espying a Serpent lying along vnder the shade of a tree where she spinneth, slideth down vpon a fine thred to the head of the Serpent, and stingeth him so deep into the braine, that he falleth a hissing and grinding his teeth: he keepeth a winding and turning about, but hath not the power to breake the thred that hangeth aboue, ne yet to fly from the Spider: infomuch, as the Serpent lieth there dead in the place. Contrariwise, Peacocks and Houfe-doues be as friendly one to another: so be the Turtles and Popinjaies, the Merles and Turtles likewise. The Crow and the lesse Bitours also: for they ioine and band together against the common enemy the Fox. Likewise, the bird-Harpe and the Kite against the Buzzard. What will ye say? be there not tokens of affection euen in Serpents, the cruelllest and fellest creatures of all others in the world? I haue written already of the report or tale that goeth in Arcadia of a man, whose life was saued by a Dragon (that was brought vp by him) so soon as euer he knew him by his voice. As for the Aspis, Philarchus telleth a strange history of it.

K

L

M

A it. For he writeth, that in Egypt there was an Aspis vsed ordinarily to come to the table of a certaine Egyptian, and there tooke meat at his hand: which Serpent afterwards had yong ones, whereof one chanced to sting a son of the master of the house, that he died of it. Now when the dam (the old Aspis) came accordingly at the accustomed houre of repast for viuals, and perceived the deed committed by her little one, not onely killed it in satisfaction of the former fact, but also forbore the house, and was neuer knowne to repaire thither againe.

CHAP. LXXV.

¶ The sleepe of liuing creatures.

THE question, Whether liuing creatures sleep or no? is not very difficult, but soon decided: For plain it is, that of land creatures, all that winke and close their eies doe sleepe. As for those in the water, that they also sleepe (though but a little) euen they are of opinion who otherwise make doubt of the rest. And this they do not collect & gather by their eies (for lids they haue none to shut) but because they are seene to lie so still and quiet, as fast and sound asleep, stirring no part, but a little wagging their tailles, and seeming to start and bee affright at any sudden noise made in the water. As for the Tunnies, we may auouch more confidently of their repose: for they come of purpose to sleep vnder the banks or rocks. And flat broad fishes lie so still sleeping among the shelues, that oftentimes a man may take them vp with his hand. The Dolphins and Whales be heard to rout and snort again, they sleepe so soundly. Moreover, as touching Insects, no man need to doubt that they sleep, so quietly do they lie and make no noise: nay, if you bring a candle or other light, and set it euen before their eies; you shall not haue them to awake nor moue. An infant after it is borne, sleepeth for certaine moneths at the first, and in manner doth nothing els. But the elder hee waxeth, wakefull is he euery day more than other. Babes at the very beginning do dreame. For they will waken and start suddenly in a fright, and as they lie asleep, keep a sucking of their lips, as if it were at the breast heads. Some neuer dream at all. And if such chance contrary to this custome, for to dreame once, it hath bin counted for a signe of death, as we haue seene and prooued by many examples and experiments. And here in this place there offereth it selfe a great question, and very disputable *pro & contra*, grounded vpon many experiments of both sides: namely, whether the soule of man while the body is at rest, foreseeeth things to come: and how it should so do: or whether this be a thing of meere chance and altogether coniecturall, as many others be? And surely if we go by histories, we may find as many of the one side as the other. Howbeit all men in manner agree in this, That dreames either immediatly vpon drinking wine and full stomacke, or els after the first sleep, are vaine and of no effect. As for sleep it is nothing els but a retreat and withdrawing of the soule into the mids of it selfe. Euident it is, that Horses, Dogs, Kine, Oxen, sheep, and goats do dreame. Whereupon it is credibly also thought, that all creatures which bring forth their yong quick and liuing, do the same. As for those that lay egges, it is not so certaine that they dreame: but resolued it is, that they all do sleep. Now let vs passe and proceed to the treatise of Insects.

THE ELEVENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIVS SECVNDVS.

The Proeme.

IT remaineth now to write of those liuing creatures, which are the most subtil of all others that Nature hath brought forth: forasmuch as some are of opinion, That they breath not, yet haue any bloud at all.

CHAP. I.

¶ Of Insects in generall.

MAny and sundry sorts there be of Insects, as well among land creatures as those that fly in the aire. Some are winged, as bees: some haue partly wings and partly feet, as Pismires: others want both, and neither flie nor go on their feet. And wel may they all be called *Insecta*: by reason of those cuts and diuisions, which some haue about the necke; others in the breast and belly; the which do go round and part the members of the body, hanging together onely by a little pipe and fistulous conueiance. There be of them, that haue not the body diuided entire, one part from the other by these incisures, cuts, and wrinkles; but they appeare only either vnder the belly, or vpon the backe aboue, and go no deeper, neither yet round the whole compasse of the body. But a man shall perceiue in them certaine rings or circles, apt to bend and wind to and fro, and those so plated and plaited one ouer another, that in nothing elswhere is more seen the workmanship of Nature, than in the artificiall composition of these little bodies.

CHAP. II.

¶ The industrie and subtiltie of Nature in framing these Insects.

IN boddes of any bignes, or at least-wise in those of the greater sort, Nature had no hard piece of work to procreate, forme, and bring all parts to perfection; by reason that the matter whereof they be wrought, is pliable and will follow as she would haue it. But in these so little bodies (nay pricks and specks rather than bodies indeed) how can one comprehend the reason, the power, and the inexplicable perfection that Nature hath therein shewed? How hath she bestowed all the five senses in a Gnat? and yet some there be, lesse creatures than they. But (I say) where hath she made the feat of her eyes to see before it? where hath she set & disposed the tast? where hath she placed and inserted the instrument and organ of smelling? and aboue all, where hath she disposed that dreadful and terrible noise that it maketh, that wonderfull great sound (I say) in proportion of so little a body? can there be deuised a thing more finely & cunningly wrought than the wings set to her body? Marke what long-shanked legs aboue ordinary she hath giuen vnto them. See how she hath set that hungry hollow concauitie in stead of a belly: & hath made the same so thirstie and greedy after bloud, and mans especially. Come to the weapon that it hath to pricke, pierce, and enter through the skinne; how artificially hath shee pointed and sharpened it? and being so little as it is (as hardly the fineness thereof cannot be seen) yet as if it were of bignesse & capacity answerable, framed it she hath most cunningly for a twofold vse: to wit, most sharpe pointed, to pricke and enter; and withall, hollow like a pipe for to sucke in and

Plinies Naturall History.

A and conuey the bloud through it. Come to the Wood-worme, what manner of teeth hath Nature giuen it, to bore holes and eat into the very heart of hard Oke? who heareth not the sound that she makes while she is at her work? For in wood and timber is in manner all her feeding. We make a wonder at the monstrous and mighty shoulders of Elephants, able to carry turrets vpon them. We maruell at the strong and stiffe necks of buls, and to see how terribly they will take vp things and tosse them aloft into the aire with their hornes. We keepe a wondering at the rauening of Tygres, and in the shag manes of Lions: and yet in comparison of these Insects there is nothing wherein Nature and her whole power is more seene, neither sheweth she her might more than in the least creatures of all. I would request therefore the Readers, that in perusing this treatise, they will not come with a preiudicate opinion, nor (because many of these silly flies and wormes be contemptible in their eyes) disdain, loath, and contemne the reports that I shall make thereof; seeing there is nothing either in Natures workes that may seeme superfluous, or in her order vnworthy our speculation.

CHAP. III.

¶ Whether Insects do breath, and whether they haue bloud or no?

DIuers haue denied that they breath at all; and vpon this reason they ground their position: Because they haue no arterie or wind-pipe annexed or reaching to any instrument within of respiration. And they be of opinion, that they liue indeed as plants, herbes, and trees: howbeit (say they) there is a great difference betwene hauing life, and drawing wind or vitall breath. And by the same rule they affirme, that they haue no bloud, which is in none that bee without heart and liuer. Neither do any things breath which want lungs. And from hence arise a world of other questions thereupon depending. For the same men deny flatly, that these creatures haue any voice: notwithstanding so great humming of bees, & singing sound of grasshoppers, and such other, whereof we will consider in due time & place, accordingly. Verily for mine owne part, the more I looke into Natures workes, the sooner am I induced to beleue of her euen those things that seem incredible. Neither do I see any inconvenience to thinke, that these Insects may as well draw wind and breath without lungs, as liue without such noble and principall parts as are requisite for life in other creatures: according as we haue already shewed in the discourse of fishes and such like, that liue in the sea; how soeuer the quantitie, depth, and heights of the water, may seeme to impeach and stop their breath. For who would easily beleue, that some creatures should flie at libertie, and liuing as they do in the mids of wind and aire, yet want wind and breath themselves? that they should haue a sense and care to seek their liuing, to engender, to worke, and to forecast for the time to come: and howbeit they haue no distinct members, to carry (as it were in a ship) their seuerall senses, yet that they should heare, smell, and taste, yea and be indued with other singular gifts besides of Nature, to wit, wisdom, courage, skill, and industrie. Indeed, confesse I must, that bloud they haue none: no more haue all creatures that liue vpon the land: howbeit a moist humor they haue, somewhat like vnto bloud, which serues them in stead thereof. Like as in Cuttels of the sea, there is found a certain blacke liquor in stead of bloud: and in all the sort of Purples and such shel fishes, that excellent iuice which staineth & dieth so as it doth. Semblably in these Insects, whatsoeuer humor it is, whereby they liue, the same may well enough go for bloud and so be called: all the while that euery man hath liberty to giue it what name he thinketh fittest. As for me, my purpose is not to judge and determine of these doubtfull quilllets, and their causes; but to set down and shew the nature of such things as be cleare and apparent.

CHAP. IIII.

¶ The substance of the body in these Insects.

THese Insects, so far as a man may perceiue, seeme not to haue either sinewes or bones, no chine nor gristle, no fat, no flesh, ne yet so much as a tender and brittle shell, as some Sea-fishes haue, nor that which may be truly called a skin, but a certain corporal substance of a middle nature between all these: for their body without, is like a dry thing, and yet more tender and soft than a sinew: whereas in all other parts the matter is to be accounted rather drie than

than hard. This is the very substance whereof they consist, and nothing haue they besides. For within there is nought, vnlesse it be in some very few, who haue a certaine pipe or conduit in stead of a gut, & the same wrapped and infolded together. Which is the cause, that if they be cut in two and pulled in pieces, yet they haue a speciall property to liue long, and each part asunder wil pant & stir by it selfe. The reason is, because the vitall vertue in them (whatsoeuer it is) is not seated in any one member, this or that, but spread and defused throughout the whole body, and least apparent in the head, of all other parts: for, that alone, vnlesse it be plucked away together with the breast, moueth not one jot. No kind of creatures haue more feet than these: and the more they haue, the longer liue they when they be diuided asunder; as we see by experience in the Scolopendres. Eies they haue, that is certain; & besides sight, they are not without the senses of feeling & tasting: some there be that smell, & a few that haue their hearing also. H

CHAP. V.

¶ Of Bees.

But among them all, Bees are principall, and by good right deserue especiall admiration, as being the only Insects ordained by Nature for mans vse. They gather hony, a most sweet, pleasant, fine, and wholefome liquor. They frame the hony combs, and work the wax, which serue for a thousand turns in this life. They indure pains continually, and dispatch their worke and businesse. They haue a policie and Commonwealth among themselves. They hold their seuerall counsels: and there is not a swarme or cast that they haue, without a king and captain of their owne: and that which is most admirable of all, there be ciuill fashions and customes among them. Moreouer, being as they are, neither tame and gentle, nor yet to be counted wilde and sauage, yet (see the wondrous worke of Nature!) by the means of so little a creature, nay, a shadow rather (to say a truth) of the least creature, she hath effected a thing incomparable: what strength of sinewes, what force and puissance is able to countervail this so great industry and effectual power of theirs? What wit and policy of man is answerable to their discret and orderly course? Beleue me, they passe them all, and in this one point surpasse, That all things are common among them, and nothing know they priuie and seuerall. What should we debate and make question any more as touching their breath? Why should wee dispute of their blood, which cannot chuse but be very little, in such smal bodies? Let vs rather consider henceforth their wit, and the gifts of their mind. K

CHAP. VI.

¶ The naturall order and regiment that is in Bees.

Bees all winter time keep close within their hives: and good reason; for how possibly should they indure hard frost and chilling snow? how should they abide the piercing blasts of the North winds? And verily it is the manner of all these Insects so to doe, but yet they keepe not in so long. For why? being nestled warm as they are within our houses, they sooner doe recover their vigor, & come abroad betimes. But as concerning Bees, either the times haue changed, & places altered their course, or els the writers beforetime of this argument haue greatly erred; They begin to retire themselves and take vp their wintering harbor, presently vpon the setting and occultation of the star Vergiliæ; and come not forth into the field againe, vntill after the rising and apparition thereof. So that Bees go not abroad at the very beginning of the Spring, as Writers haue set downe (for who seeth nor the contrary throughout all Italie) but remaine still close and secret, vntill that Beanes begin to bloom; before which time they scit not themselves to any worke or labour. But from thence forward, they lose not a day, they slack not their painful trauel, neither play they one jot, if the weather be faire & wil permit: the first thing they do, is to make their combs & wax, that is to say, their own habitations & store-houses. When they are prouided of lodging, they thinke vpon the multiplying of their owne kind: and finally, they gather and make both hony and wax: the substance whereof they sucke from the floures of trees and hearbes, from the gums also of trees which breed such gluiematter, and besides, out of the iuice, gum, and rosin of the willow, elme, and cane. With these and such like, they plaister all the hie within throughout, as it were with a coat or parget, intermingling

A gling withall other iuices that are more vnfauorie, gathered from the bitterest hearbs they can get: to the end that they might keepe out other little vermines that are greedy of their hony: as knowing full well, that they are about a peece of worke which is worthie to be desired and sought after. Of this gummy and glutinous substance they frame also their dores and entrie which are wide and large.

CHAP. VII.

¶ The proper termes belonging to their worke.

The first foundation of their worke, skilfull hony-masters do call Commosis: the second Pissoceros: the third Propolis, which lieth between those former coats and the wax of the hony-combe, whereof there is so great vse in Physicke. Commosis is the first coat or crust of a bitter tast. Pissoceros commeth next after it, as it were a thinner course of pitch or varnish and a weaker kinde of wax, made of the more liquid and mild gum of vines and poplars. But Propolis consisteth of a more solid matter, as hauing the strength of some floures withall: howbeit, as yet it is no ful and perfect wax, but the foundation and strengthening of the combs: and serueth as a good defence against cold, and to stop the passage of waspes and such hurtful creatures as would do iniurie to the bees, for stila strong sent it carrieth, as which, many men do vse in stead of Galbanum. After this munition done, then followeth the prouision of that which is called Erithace, some terme it Sandaracha, and others, Cerinthus. This must serue for the bees meat, whereof they are to liue whiles they worke: and found it is oftentimes, laid apart within the concavities of their combs, it being also of a bitter taste. Now this Erithace commeth of the * Spring-dew, and the moisture issuing out of trees in manner of gum: in lesse abundance euer, when the South-west wind blows: but when it is full South, more blacke: and in the Northerly constitution, far better and more red withall. Great store hereof, Bees meet with vpon Almond trees. Menecrates saith, That it is a floure foreshewing what haruest shall issue: * but no man saith so besides him.

double signi-
fication.

CHAP. VIII.

¶ What flowers they be which Bees serue themselves most withall for their worke.

As for wax, Bees gather and make it of the floures of all trees, herbs, and plants, sauing the docke and * Goose-foot, which are two kinds of herbs. Some except also a kind of Broom called Spart, but vntuly: for in Spaine (where there be many places full of that shrub) the hony carrieth the strength thereof in the taste. I am besides of opinion, that they be deceived who thinke that bees gather not of Oliue trees. For we see it ordinary, that there be more casts and swarmes of Bees where Oliues grow in greater abundance. These pretty creatures hurt no fruit whatsoeuer. They will not settle vpon a floure that is faded, and much lesse of any dead carkasse. They vse not to go from their hie about their busines about 60 paces: & if it chance, that within the precinct of these limits they finde not floures sufficient: out goe their spies, whom they send forth to discover forage farther off. If in this expedition, before they come home againe, they be overtaken by the night, they couch vpon their backs for feare lest their wings should be overcharged with the euening dew, and so they watch all night vntill the morning.

* Chenopodq

CHAP. IX.

¶ Those that haue taken a speciall pleasure in Bees.

Such is the industrie of this creature, that no man need to wonder at those two persons who delighted so much in them, that the one (namely Aristomachus of Soli) for threescore yeares lacking but twaine, did nothing else but keep bees. and Philiscus the Thasian employed the whole time of his life in Forrests and Desarts, to follow these little animals: whereupon hee was surnamed Agrius. And both these vpon their knowledge and experience, wrote of Bees.

Ec

CHAP;

¶ *The order that they keepe in their worke.*

THe manner of their businesse is this. All the day time they haue a standing watch & ward at their gates, much like to the *corps de guard* in a campe. In the night they rest vntill the morning: by which time, one of them awaketh and raiseth all the rest with two or three big hums or buzzes that it giues, to warn them as it were with sound of trumpet. At which signall giuen, the whole troupe prepares to flie forth, if it be a faire and calme day toward, for they doe both foresee, and also foresee when it will bee either windie or rainie, and then will they keepe within their strength and fort. Now when the weather is temperate (which they foreknow well enough) and that the whole armie is on foot and marched abroad, some gather together the vertue of the floures within their feet and legges: others fill their gorge with water, and charge the downe of their whole body with drops of such liquor. The yonger sort of them go forth to worke, and carry such stuffe as is beforenamed, whiles the elder labor & build within the hieue. Such as carry the floures abovesaid, stuffe the inner parts of their legs behind (and those Nature for that purpose hath made rough) with the help of their forefeet: & those again are charged full by the means of their muffle. Thus being full laden with their prouision, they return home to the hieue, drawne euen together round as it were in a heap, with their burden: by which time, there be three or foure ready to receiue them, and those ease and discharge them of their lode. For this you must thinke, that they haue their seuerall offices within. Some are busie in building, others in plaistering and ouercasting, to make all smooth and fine: some be at hand to serue the workemen with stuffe that they need: others are occupied in getting ready meat and victuals out of that prouision which is brought in: for they feed not by themselves, but take their repast together, because they should both labour and eat alike, and at the same houre. As touching the maner of their building, they begin first aboue to make arch-work embowed, in their combs, and draw the frame of their work downward, where they make two little allies for euery arch or vault, the one to enter in by, the other to go forth at. The combs that are fastened together in the vpper part, yea and on the sides, are vnited a little, and hang all together. They touch not the hieue at all, nor ioine to it. Sometime they are built round, otherwhiles winding bias, according to the proportion of the hieue. A man shall find in one hieue hony combs sometime of two sorts: namely, when two swarms of bees accord together: and yet each one haue their rites and fashions by themselves. For feare lest their combs of wax should be ready to fall, they vphold them with partition wals, arched hollow from the bottom vpward, to the end that they might haue passage euery way to repaire them. The foremost ranks of their combs in the forefront, commonly are built void and with nothing in them, because they should giue no occasion for a theefe to enter vpon their labours. Those in the backe part of the hieue, are euer full of hony: and therefore when men would take out any combs, they turne vp the hieues behind. Bees that are employed in carrying of hony, chuse alwaies to haue the wind with them, if they can. If haply there do arise a tempest or a storm whiles they be abroad, they catch vp some little stony greet to ballance and poise themselves against the wind. Some say, that they take it and lay it vpon their shoulders. And withall, they flie low by the ground vnder the wind when it is against them, and keepe along the bushes, to breake the force thereof. A wonder it is to see and obserue the manner of their worke. They mark and note the slow-backs, they chastise them anon, yea, and afterwards punish them with death. No lesse wonderful also it is to consider how neat and clean they be. All filth and trumperie they remove out of the way: no foule thing, no ordure lieth in the hieue to hinder their businesse. As for the dounge and excrements of such as are working within, they be laid all on a heap in some by-corner, because they should not goe far from their worke: and in foule weather (when otherwise they haue nought to do) they turn it forth. Toward euening, their noise beginneth to slacke and grow lesse and lesse: vntill such time as one of them flieeth about with the same loud humming, wherewith she waked them in the morning, and thereby giueth a signal (as it were) and commandement for to go to rest: much after the order in a campe. And then of a sudden they are all husht and silent.

¶ *Of the drone Bees.*

THe houses and habitations that Bees build first, are for the Commons: which being finished, they set in hand with a pallace for their king. If they foresee that it will be a good season, and that they are like to gather store of prouision, they make pavilions also for the Drones. And albeit they be of themselves bigger than the very bees, yet take they vp the least lodgings. Now these drones be without any sting at all, as one would say vnperfect bees, & the last fruit of such old ones as are weary and able to do no more good; the very later brood & increase, and to say a truth, no better than slaues to the right bees indeed. And therefore the others as master Bees ouer them, haue them at their commandment: if any drudgery or such like businesse is to be don, out are they sent first: make they but slow haft in that they are set about, sure they are to pay for it, and to be punished without mercy. And not only in their ordinarie worke they serue them in good stead, but also they help them to multiply: for the hotter that the place is, the more hope there is of a greater increase. Certes, this is found by experience, That the better the hieue is peopled with a number of bees, the Cast when time comes will bee the greater, and the oftner will they swarme. But after the hony is growing once to maturity and perfection, then begin they to driue these drones out of doores: nay, ye shall haue many bees set vpon one poore drone, and kill him out-right. So that a man shall not lightly see any of that kind but in the Spring time.

If one pluck off the wings from a drone, and put him again within the hieue, he will neuer lin vntill he haue done the like by all the rest of the same kind. As touching the roiall pallsaces for the kings and captaines that shall be, built they are all most stately, great of receit, in shew magnificent, seated by themselves apart, and like citadels raised vpon some high knap or tuft of a mountaine. If one of these castles chance to be pressed or crushed, there will no more come of that princely race. All the lodgings and roomes where the bees abode is, are six cornered, according to the number of feet employed in that worke. None of all this is done at any set time or day appointed: but they take the opportunity when they can espie faire weather to fit their businesse, and so do these things by snatches. And surely within a day or two at the most, they fill their store-houses with honic.

¶ *The Nature of Hony.*

THis pleasant and sweet liquor which we call hony, is ingendered naturally in the aire, and especially by the influence and rising of some starres: but principally during the seruent heat of the canicular daies, euen when the Dog-star is in his full power and force: neuer before the appearing of the star Virgilie, but alwaies before day. For so about the day breake betimes in the morning, the leaues of trees are found bedewed with hony: and looke whosoever they are, that haue occasion to be abroad in the aire about the dawning of the morrow, they may euidently perceiue their cloths wet with a clammy humor of hony, yea, & their hairs glewed therewith together, if they go bare headed. Be it what it will, either a certaine sweat of the skie, or some vnctuous gelly proceeding from the stars, or rather a liquor purged from the aire when it purifieth it selfe, would God we had it so pure, so cleare, and so naturall, and in the own kind refined, as when it descendeth first, whether it be from skie, from star, or from the aire. For euen now such as it is, passing as it were through so many hands: namely, falling from a region so high and remote from vs, and in the way as it commeth catching much filth: and namely, infected with the grosse vapour of the earth which it meeteth in the fall: moreover, sucked and drunke (as it is) by the Bees from the leaues of trees and grasse, and so gathered and laid vp in their little bellies or bladders (for at their mouth they spew and cast it vp again: corrupted also and sophisticated with other humors drawn out of floures: finally, so long soking within the hieues, and suffering so many alterations: yet for all the sorrow, a great resemblance it carrieth still with it of a most pleasant, sweet, and celestiall liquor.

CHAP. XIII.

¶ The best kinde of Honie.

THe best hony is euer there, where the best floures are, within the receptacles whereof, it lieth. As we may see in the country about Athens, which carrieth the name for honey: also in Sicilie within those territories about Hymettus and Hybla: and lastly, in the Isle Calydna. Now this hony, whereof we treat, is at the first cleare and thin as water; and for certaine daies in the beginning, it workes and boiles like to new wine, and so purgeth it selfe. By the 20 day it getteth a certaine consistence and thicke substance, and soon after gathers a thin cream or skin ouer it: which in the very heat of working, is raised of a scum, and so thickneth. The best simply that bees can sucke, and least infected with the corruption of 3 branches, is that which they get out of the leaues of Oke, Tilia [i. Linden tree] and Canes.

CHAP. XIII.

¶ The sundry sorts of hony, according to diuers regions.

Honie (as we said before) is better or worse, according to the region where it is gathered; and that in many respects. For in some place ye shall haue goodly combs: howbeit, more commendable for wax than the hony in them: as in the Pelignians country, and Sicily. In others, and namely in Candie, Cypres, and Africk, the combs yeeld more hony than wax. Some countries there be, especially in the North parts, where the combs passe for bignesse: in so much as in Germany there hath bin a hony-combe seene eight foot long, and blacke all within. But in what region soeuer it be that hony is found, three kinds there be of it. First, the Spring hony made of floures only, like as the comb also: and thereupon the Greeks call it Anthinon, which is as much to say as the Floure-hony. Some would not haue this to be once touched, but to serue for nourishment of the young bees, that the swarms or casts may be more strong and lustie. Others againe leaue for the bees of none lesse than of it: by reason of the great plenty like to follow, at the rising of those notable stars in the Summer ensuing. Moreover, the combs are in their principall beauty about the Sun-stead in summer, when daies be longest, at what time as the Vine and Time do begin to floure. Also, in taking forth of the hony combs, needfull it is to be well aduised in ordering the matter for the prouision of food for bees. If they be cut short and destitute of their meat, they either despaire and die for want, or els depart and flie away. Contrariwise, if you leaue them too much, plenty breeds idlenesse, that they will not labour: neither deigne they to feed of Erithace, their ordinarie food, but fall to the good hony. They therefore that be well experienced in these matters, thinke it good to leaue them the twelfth part of this store and vintage, if I may so say, which is gathered in the combs. And verily, it seemeth that Nature hath ordained a certaine set day for to begin this vintage, if men would take knowledge thereof, and marke it well; namely, the 30 day, after the bees swarmed and went forth: and usually it falleth out, that this gathering commeth within the moneth of May. A second kind of hony there is, which we call Summer hony, and is named also Horæum, of that principall season wherein it is made, namely, in the very midst of dog-daies, when the star Sirius is in his full strength: and that commonly is 30 daies after the Sun-stead. And I assure you, Nature hath shewed her admirable and excellent power to men ward in this behalfe: in case their fraud and deceit would suffer her works in their entire and proper nature without corruption and sophistication, which marreth all, and maketh nothing but confusion. For vpon the rising and apparition of any star, and especially of those that be more excellent than the rest, or after that a rainbow is seen about the earth, and no showers of rain presently follow, but a drizzling dew warmed with the raies and beams of the Sun: ye shall haue that which falleth, not to be bare hony, but a very medicinable thing, euen a celestiall gift, singular good for eies and vicers, yea, and comfortable to the principall noble parts within the body. And if this happen to be at the rising of the dog-star, and it chance withall, that vpon the same day (as oftentimes it falleth out) Venus, Iupiter, or Mercury bee Orientall, then shall yee haue so heavenly a sweet liquor, that no one thing in the World may bee comparable to it for the curing of all our maladies, and euen to reduce and recouer vs backe from death vnto life, like vnto that celestiall

CHAP. XV.

¶ The markes of good hony.

More plenty of hony is gathered in the full of the Moone, than at any other time: and if therewith the weather be faire, the same wil be more vnctuous and fattie. In all kinds, the best hony is that, which runneth of it selfe as new Wine and Oile; and called it is, Acedon, as a man would say, gotten without care & trauell. All Summer hony is red, as being made in the driest season of the yere. The hony which commeth of Time, is held to be the best and most profitable; in colour like gold, in taste right pleasant; euident to be knowne by the little leaues therein: and the same is likewise fattie. That which is made of Rosemary, or within the aire and vapour of the sea, is thick: and such verily as is thus candied, and will not run like life-hony, is nothing commendable. As for Time hony it will not thicken: and if a man touch it, rope it wil and draw small slimie threads after it: which is a principall signe of the weight and heavinesse thereof. If hony be short in the handling, and soon breake, and that the drops part one from the other, it is thought to be a token of the worst and coursest of all. Another triall there is besides of good hony, namely, if it be fragrant and odoriferous to smell vnto, sweet in taste, & biting withall, or quick at the tongues end, glutinous and cleare. As touching the druing of hiues for summer hony, *Thasius Dionysius* is of opinion, that the tenth part therof should be left for the bees, namely, if they were full: if not, then according to the proportion: but if they were but light and very thin, he would not haue them to be touched at all. The Athenians goe by this rule, and do obserue duly the Caprificial day, which is kept wholly vnto *Vulcan*: for then they euer begin to driue their hiues for this kind of honie.

CHAP. XVI.

¶ Of a third kinde of Honie: and how a man should know good Bees.

THere is a third sort of wild hony, which the Greeks call *Ericurum* [i. Heath or Ling hony] and is of least reckoning. It is gathered after the first rain in Autumne, when the heath and lings only bloom in the woods, wherupon it seems as if it were sandy. This kind of hony is ingendred for the most part after the rising of *Arcturus*, much about the Ides of September. Some there be that continue in gathering Summer hony to the rising of *Arcturus*: betwene which and the Autumne Equinoctial are 14 daies; & from thence vnto the setting of *Virgilie* (namely, for the space of 48 daies) the said heath is most in his blooming time. This shrub the Athenians call *Tetralix*; the Eubœans name it *Sifara*: & they repute it to be a floure most pleasant to bees, haply, because at that time there is no plenty of other floures. This gathering of hony is about the end of vintage, & the occultation of the *Virgilie*: & commonly ends by the Ides of Nouember. In druing of the hiues for this hony, by good reason, two [third] parts therof would be reserued for the bees: & especially those corners of the combs, which haue in them the prouision called *Erithace*. From the mids of winter to the rising of *Arcturus*, for 60 daies bees are nourished only with sleep, without any other food. But from that time vnto the spring equinoctial, and namely, where the weather is more warm, they are awake. Howbeit, they lie still in their hie, & then fall to their victuals which they had laid vp in store against that time: but in Italy they do the like indeed after the rising of the star *Virgilie*: howbeit, till then they do nothing but sleep. And there verily, men vse when they take the hony forth of the hiues, to weigh the combs, and so by weight dispense & set out how much they will leaue them for their food: hauing this opinion, that they are bound to deale in justice & equity euen with the very bees: in so much, as it is commonly said, if they be defrauded of their due in this society & part-taking, and find falshood in fellowship, they wil die for grieve: & so both the old stock will be lost, and the hony also of a new increase. In the first place therefore, this is a rule, that such folk only be set about this businesse to driue the hiues, who are neat & clean. A theefe & a woman whiles she is in her month ly sickness, they abhor. In the taking out of hony, the best means to driue away the bees, is to smoke them out of the hie: lest that you anger them, or that they deuoure the honie themselves with more greedines. Moreover, when they grow to be idle, perfuming & smoking

Ec 3

of

of them thus now and then, maketh them more fresh to go about their worke. For when they lie still and doe nothing, they make their combs looke dead and blackish. Again, if they be ouermuch smoked, they will be the worke for it; and surely, the very hony soon catcheth the hurt hereof, for so tender and weake will it be, that with the least dew that is, you shal haue it to turne and wax foure. And therefore in all kinds of hony they obserue and keepe that which is called *Acapnon* [i. without smoke.] The hony gathered of both sorts of Thyme, called thereupon *Bithymum*, is not white: howbeit, very good it is for eyes and to cleanse vlcers.

Now as touching the generation of Bees, and how they multiply and increase, much dispute there hath bin among the learned, and a nice question this is. For first and foremost, bees were neuer seen to ingender one with another: and therefore most men haue bin of opinion, that yong bees must needs be made of floures fitly and hand somely laid together and composed, according to Natures lore. Others say, that one master Bee which is the king in euery swarme, doth beget them all: and that he forsooth is the only male; bigger also than the rest and more strong, because he should not faint and faile in the action: for without such an one, we see there is no breed: and him all the other bees attend vpon, not as their leader and captain, but as the female follow the male. Certes this was a good coniectural opinion, and sounding to a truth, but that the breed of these Drone-bees aforesaid, doth checke and ouerthrow it cleare: for what reason is there that one and the same maner of procreation, should bring forth some perfect & others vnperfect? The former opinion yet might seeme more probable, but for another difficulty and inconuenience that crosseth it too; for otherwhiles in the vtmost edges and sides of the combs, there are seen to breed the bigger kind of bees, which chase and driue the others away: and this vermin is called *Oestrus* [i. the gad-bee or horse flie.] Now if those little wormes or grubs from whence the bees come, were made of floures, which they themselves formed and brought into fashion, how commeth this gad-bee, and whereof is he made? This is certaine, that bees couvy and sit as hens do: and that which is (after a sort) by them hatched, seemeth at the first to be a little white grub or magot, lying crosse ouerthwart the hony, and so fast sticking thereto, as if it seemed to feed thereupon. The king that shall be, at the very first is yellow, and of the colour of hony: as if he were made of the most choise and excellent floure of all the rest: nothing like to a grub as the other, but presently hath wings. The rest of the multitude, when they begin to take some shape, are called Nymphs: like as the Drones at the beginning, be termed Sirenes or Cephenes. If a man take their heads from either sort, before they be winged, it is a most pleasant and excellent meat for the old dams. In proceesse of time as they grow bigger, the old bees distill and drop meat into their mouths, as they sit vpon them: then they keep most humming (as some thinke) for to set combs into an heat, which is requisite and necessarie for the hatching of them: and thus they continue, till the little pellicles or membranes be broken: within which, euery one lieth by it selfe, as eggs: and then they break forth all together and shew themselves accomplished bees. The manner and experiment hereof, was seene vpon a time in a ferme neere vnto Rome, belonging to a nobleman of Rome who sometime had bin Consul: for he caused his hives to be made of lanterne horns that a man might see through into them. These yong worms be 45 daies before they come to their perfection.

There is found in some combs, a certain bitter thing and hard like to wax, which the Latines call *Clerus*. This is as it were the abortiue and vntimely fruit of the bees, to wit, when either by maladie or idlenesse, or rather vpon some barrennesse and vnfruitfull disposition by nature, bees are not able to bring the same to perfection.

As for the yong bees, they are not so soon abroad, but they begin to labor with their mothers; and are trained by them to learn how to gather hony. This yong people haue a yong king also: vnto whom they make court, and whom they follow. And many such kings are bred at first, for feare lest they should want: but when the bees are grown big, they all agree with one accord and voice, to kill those that be most vntoward among them, for feare they should make diuisions, factions, and siding to parts. These kings be of two sorts: those that are red all ouer, be better than the black or partie coloured. All the race of them be very faire and goodly to see to: and twice as big as the rest: their wings shorter, their legs streight: in their port and manner of march, more stately: carryiug, in their front a white star, like a diadem or coronet: far brighter also and more neat they be than the common sort.

CHAP.

CHAP. XVII.

¶ The regiment of Bees, and their government.

What shall a man now dispute about *Hercules*, whether there was but one of that name or many? Likewise as touching the Sepulchre of Prince *Bacchus*, where and which it is? As also trouble his head in many other such like antiquities, buried by long continuance of time. For behold, in one small matter that is daily seene in our country houses, in a thing annexed to our fermes, and whereof there is such store, all Authors who haue written of Agriculture are not yet resolved: namely, Whether the king of Bees alone hath no sting, and is armed only with majestie? or, whether Nature hath bestowed a sting vpon him, and denied him only the vse thereof? For certaine it is, that this great commander ouer the rest, doth nothing with his sting: & yet a wonder it is to see, how they all are readie to obey him. When hee marches abroad, the whole armie goes forth likewise: then they assemble together, and enuiron him round about; they are of his guard, & so close they keep vnited together, that they wil not suffer him once to be seene. At other times, when all his people are busie in labor, himselfe (as a right good captaine) ouerseeth their workes, goes about from one to another, encouraging them in wel doing, and exhorting them to plie their businesse: himselfe only exempt from all other trauell & pains taking. About his person he hath a certaine guard euer attendant: he hath his Lieutors & officers alwaies in readinesse, in token of majestie and princely port. He neuer sets forward, but when the whole swarme is prest likewise to goe forth: and in truth, long time before a man may perceiue that they be about a voiage and expedition; for, many daies together there is an extraordinarie humming and noise within, whiles they prepare to dislodge, trussing vp as it were their bag and baggage, and expecting only a faire day of remoue. And suppose that the king haue in some battaile lost one of his wings, yet will not his hoast forsake him and flie. When they be in march, each one desires and striues to be next the prince, as taking a joy and pride to be seene of him, how lustily they performe their deuoir. If he begin to be wearie, they support him with their shoulders: if he be tired indeed and faint outright, they carry him full and whole. If any one of their owne companie chance to faile for very wearinesse, and doe drag behind, or stray aside and wander out of the way, it will yet endeavour to follow the armie only by the smell and sent. Where the king once settles and takes vp his resting place, there they all pitch downe their tents and encampe. And I assure you, herein lieth a matter of great weight and importance; as touching the Auguries and prelages gathered by the manner of their settling, prognosticating both to publicke states and also to priuat persons, something to ensue of much moment, either for good or otherwise, according as they haue been obserued to hang together in clusters like bunches of grapes, either at mens houses, or on the temples of the gods. By occasion whereof, folke had recourse to their deuotions and sacrifice, for to appease the heauenly powers: and yet oftentimes such foretokens haue not bene expiat without some strange euents in the end. There was a swarme of Bees rested vpon the very lips and mouth of *Plato*, when he was but a very babe & infant; foreshewing (no doubt) that singular eloquence of his, and sweet vtterance that afterwards he had. Another cast of Bees settled within the very camp of General *Darius*, the very same day, when he obtained that notable victorie at *Arbalo*. By which examples we may see, that this coniecturall skill and learning of these Soothsayers holds not alwaies, nor proues euer true: for they forsooth suppose this to be euermore a portentous signe of some fearfull euent and misfortune. To returne againe to our captaine Bee: if he chance to be entrapped and surprized by the enemie, the whole armie is sure withall to be taken with him. If he be defeated & slain, the field is lost: all the rest be scattered, and seek their fortune to serue some other prince: for without one king or other, line they cannot. Sometime they are driuen to kill those of the kings race, and namely when there be many kings together: but this they doe perforce and full against their wills: and before they will so do, they chuse rather to ruinate and pul down the houses wherein they were bred; especially when there is some feare of scarstie, by reason of the vnkind season: and at such a time also, they chase and driue away the drone bees. And yet I see some doubt made of them: for diuers be of opinion, that they be a kind of Bees by themselves, and that the rest do set against them as very reeues. The biggest they are of all others, but blacke and broad bellied: good reason therefore that they should be

be called Theeues, because they come stealing and eat vp their honey. Certaine it is, that these drones be killed by the other Bees: and surely, king of their owne they haue none. But how they should be naturally without a sting, there is some question, & the same as yet not determined. This is well known, that in a moist and rainie spring, Bees multiply better: but if it be drie weather, there will be more increase of hony. Now if it happen, that the meat in one hiue be spent, the Bees belonging thereto will assaile their next neighbors, with intent to rob & spoile them of their prouision. But they on the contrarie side, put themselves in battell array, with full intent to take them againe. And if there chance to be a keeper by, to see the combat, that part which perceiues him to fauor their side, will not once make at him for to sting him. Other causes there are besides, which make them often to go together by the ears, & then shall ye haue feuerall captaines to arange their battalions one against another. But most of all they brawle and jar vpon occasion of gathering and carrying floures, whiles they call each one to his owne companie, for to come forth and take part. But all this great fray is soon parted and dispatched, either by casting vp some dust among them, or by making a little smoak & perfume vnder them. And reconciled soone they be againe, with setting before them a messe of milke, or honied-water.

CHAP. XVIII.

¶ *Of the sundrie sorts of Bees in generall: and what things be contrarie and hurtfull vnto them.*

There is a kind of rusticall and wild Bee: and such are more rough and hideous to see to: much angrier also and curst than the rest: howbeit, more laborious and painfull by farre. Of domestical and tame house-Bees, there are two sorts. The best be those that are short, well trust vp and round, and withall, painted with sundrie colours. The long ones be the worse, and such as resemble waspes: and yet the worst of all others, be those that are hairie all ouer. Within the kingdome of Pontus there be white Bees, and those make honey twice in euerie moneth. Moreouer, along the riuer Thermoodon, there be two sorts more. The one, gathers hony in trees: others, within the ground, and bring great increase thereof: for they frame their combs with a threefold course and ranke. The sting that Nature hath giuen vnto Bees sticketh within their bellies. Some are of opinion, that with the first pricke they giue with it, they die presently. Others hold, that they die not withall, vnlesse they thrust it forth so far, that some of the gut follows after: may howsoeuer it be, they become afterwards no better than drones: neither gather they any more honey, as if they were gueldd of their vigor and strength: so as they cease to doe good and harme both at once. We find it written in Chronicles, that horses haue been stung to death by them. Filthie stinking fauors they cannot abide, and namely, such as be contagious; and from them will they flie farre enough. Nay more than that, sure they will be to haunt & sting them that smell as they go of sweet pomanders and odoriferous ointments, notwithstanding they be otherwise themselves subiect to the injuries of most liuing creatures. For first and foremost, they are molested and assailed by those of their owne nature, but yet degenerate and of bastard breed, to wit, Wasps and Hornets: also by a kind of Gnats called Mutiones, Swallows, Martins, and some other birds, make foule worke among them, and are their mortall enemies. The Frogs lie in wait for them as they come to drink: which is the principall worke they haue to doe, when they be about to multiply and breed yong. And not those Frogs only which keep in standing pooles and running riuers, but those land-Frogs of a Todes kind will come of their owne accord from out of the brambles and briers where they keep, and leap vp to the very dore and entrance of the hiue; were they wil blow and breath in vnto them: and when the Bees come flying forth thither, to see what the matter is, soone are they snapt vp and deuoured. And as for Frogs, all the sort of them are supposed not to feele the pricke of their sting. Sheep also are no friends of theirs: for if they be once intangled within their wool, hardly can they get out again. Seeth but Crab-fish neer to their hiues, the very aire & smell thereof will kill them. Ouer and besides, Bees naturally are many times sick; and that do they shew most euidently: a man shall see it in them by their heauie looks, & by their faintnesse in their busines: ye shall mark how some will bring forth others that be sicke and diseased, into the warme sun, and be readie to minister vnto them & giue them meat. Nay, ye shall haue them to carie forth their dead, and to accompanie the corps full decently, as in a solemne funerall. If it chance that

A the king be dead of some pestilent malady, the commons & subiects indurh, they take thought and grieue with heauy cheere and sad countenance: idle they be, and take no ioy to doe any thing: they gather in no prouision, they march not forth; onely with a certaine dolefull humming they gather round about his corps, and will not away. Then requisite it is and necessarie to seuer & part the multitude, and so to take away the body from them, otherwise they would keep a looking at the breathlesse carcasse, and neuer go from it, but stil moan and mourn without end. And euen then also they had need be cherished and comforted with good victuals: otherwise they would pine away & die with hunger. To conclude, a man may soon know when Bees be well in health, by their cheerfulness and fresh hue that they carry.

CHAP. XIX.

Diseases of Bees.

Here be diseases also and imperfections in their worke: and namely when they fill not their combs, or bring not to perfection their yong Bees. The first is called Cleros, like as the other Blapsgonia. Moreouer, the sound made by reuerberation of the aire, which men call Eccho, is hurtfull vnto them, for they feare mightily that resounding noise comming with a double stroke. Mists & fogs also trouble them much: as for spiders, they be their greatest enemies of all others, in case they can preuaile so much as to enter into the hiue & weaue a copweb within it: for they kil all the Bees, and there is no remedie against it. Againe, that Moth or Butterfly which vseth to fly about the snuffe of a candle burning, (a poore silly flie otherwise, and of base account) here doth much hurt, and that in diuers sorts; for not only it self eateth and gnaweth the wax of their combs, but also doth blow and leaue behind them such excrements as afterwards proue other moths. Also, wheresoever he goes and flies within the hiue, he leaues behind him a certaine substance, comming most from the dusty downe of his wings, with which he thickneth the threds as it were of copwebs. There breed likewise euen in very wood certain worms, which aboue all things make means to eat the combs. What should I speake of their owne greedy feeding and glutting themselves with too much liquour of the floures, in the Spring time especially? whereupon ensueth a dangerous flux and loosenesse of their belly. As for oile, it is not bane to Bees only, but also to all other Insects: especially if a man dip their heads in it, and then let them be in the Sun, for presently they will die of it. Many times Bees are causes of their own death, with getting a surfet by excessiue deuouring of hony, namely when they see it ready to be taken out of the hiue: for otherwise they are very thrifty ouer-great sparers, and such, as at other times will driue out those that wast prodigally, and be gluttinous, no lesse than such as be idle larks, and slow at work. Nay, euen their own hony doth them hurt; for if they be anointed therewith in their hinder parts, they will die vpon it. Lo how many enemies this creature, so liberall and bountifull, hath! see how many casualties it is subiect vnto! and yet what be these I haue already rehearsed, in proportion and comparison of those which are omitted. Their remedies will we speake of in conuenient time and place: for this present content I will my selfe to treat only of their natures.

CHAP. XX.

¶ *How to keepe Bees to the hiue: and the manner of repairing them.*

Bees ioy in the clapping of hands, and ringing of brasen basons: at the sound thereof they will assemble and come together: wherby it is plain, that they haue the sence of hearing. When they haue done their taske of worke; when they haue brought forth their young ones, and fully accomplished all their deuoir, then they perform a solemnitie of exercise: wherein after they haue flown abroad in the open aire at libertie, fetched their compasse about on high, gathered into rings and rounds in manner of tournament for their pleasure: then at last when it is time of repast they return home again. The longest time that they can liue (say that they passe through all dangers, and no misfortune light vpon them, but euery thing that is aduerser fall out well and happily) is not aboue seuen yeares. And neuer was it knowne or heard of, that an hiue continued aboue ten yeares. Some Writers be of opinion, That dead Bees if they be kept within a house all a Winter, and when the Spring is come be laid forth in the hot Sunne

Sun to fry, and one whole day be kept covered all ouer with fig tree ashes, they will reuiue and be quick again. But suppose they be not only dead, but their bodies also lost and gon, some say they may be repaired, and a new swarm ingendred, by laying the fresh panches of oxen or kine newly killed, with the dung, garbage and all, within a dunghill there to putrifie. *Virgil* affirms, that the carcasses of any yong steers will do the same: like as dead horses will bred waspes and hornets: and Asses carrion turne to be Beetle flies, by a certain metamorphosis which Nature maketh, from one creature to another. And yet there be none of all these but are seen to engender: howbeit the manner of their breed is much after the nature of Bees.

CHAP. XXI.

¶ Of Wasps and Hornets.

Wasps vse to build them nests on high of earth and clay, and therein make their roomes and cels of wax. Hornets, in caues and holes vnder the ground. All these verily haue their chambers made with six corners, and yet their nests consist of some barke and substance like cobwebs. And as they be a barbarous and sauage kind of creatures, so their yong is not vniforme: one is ready to fly abroad, while another is but yong & not fledge, and a third a mere worrne and grub still. All these breed in Autumne, and neuer in the spring. When the Moone is in the full they increase maruellously. As for the little waspes, called *Ichneumon*es (and lesse they be than others) they vse to kill one kind of spiders, called *Phalangia*, and carry them into their nests: they besmeare them all ouer with a liniment, sit ouer them, and so procreate their own kind. Moreouer, all the sort of these liue vpon flesh, contrary to the manner of Bees, which will not touch a dead carcasse. But waspes hunt after the greater flies, and when they haue whipt off their heads, carry away the rest of their bodies for their prouision. The wild Hornets vse to keep in hollow trees: all winter time, like other Insects, they lie hid, and liue not aboue two yeres. If a man be stung with them, hardly he escapes without an ague: and some haue written, that 27 pricks of theirs will kill a man. The other Hornets which seeme to be the gentler be of two sorts: the lesse of body do worke and trauell for their liuing, and they die when winter is come; but the greater sort of them continue two yeres: and those also are nothing dangerous, but mild and tractable. These make their nests in the spring, and the same for the most part hauing foure dores or entries vnto them, wherein the lesser labouring hornets aboue said are ingendred. When those are quick, brought to perfection, & gotten abroad, they build longer nests; in which they bring forth those that shall be mothers and breeders; by which time those yong hornets that worke be ready to do their businesse and feed these other. Now these mothers appeare broader than the rest, and doubtfull it is, whether they haue any sting or no, because they are neuer seen to thrust them forth. These likewise haue their drones among them as well as Bees. Some think, that toward winter these all do lose their stings. Neither Hornets nor Wasps haue kings or swarms, after the maner of Bees, but yet they repaire their kind, and maintaine their race by a new breed and generation.

CHAP. XXII.

¶ Of Silk-wormes: the *Bombylius*, and *Necydalus*. And who first inuented silke cloath.

A Fourth kind of flie there is breeding in Assyria, & greater than those aboue named, called *Bombyx* [i.e. the Silke-worme.] They build their nests of earth or clay, close sticking to some stone or rock, in manner of salt; and withall so hard, that scarcely a man may enter them with the point of a spear. In which they make also wax, but in more plenty than bees: and after that, bring forth a greater worrne than all the rest before rehearsed. These flies ingender also after another sort; namely, of a greater worrne or grub, putting forth two hornes after that kind: and these be certain canker-wormes. Then these grow afterwards to be *Bombylij*; and so forward to *Necydali*: of which in six moneths after come the silke-wormes *Bombyces*. Silk-worms spin & weaue webs like to those of the spiders, and all to please our dainty dames, who thereof make their fine silks and veluets, forme their costly garments and superfluous apparell, which are called *Bombycina*. The first that deuised to vneueaue these webs of the silke-worme,

A worrne, and to weaue the same againe, was a woman in Coos named *Pamphila*, daughter of *Laton*: and surely she is not to be defrauded of her due honor and praise, for the inuention of that fine silke, *Tiffanie*, *Sarcener*, and *Cypres*, which in stead of apparell to couer and hide, these women naked thorough them.

CHAP. XXIII.

¶ Of the Silke-worme in Coos.

It is commonly said, that in the Isle Coos there be certaine Silkwormes engendred of floures, which by the meanes of rain-showers, are beaten downe and fall from the Cypres tree, *Terebinth*, *Oke*, and *Ash*, and they soone after doe quicken and take life by the vapor arising out of the earth. And men say, that in the beginning, they are like vnto little Butterflies naked; but after a while (being impatient of the cold) are ouergrown with haire; and against the winter, arme themselves with good thick-clothes: for being rough-footed, as they are, they gather all the cotton and downe of the leaues which they can come by, for to make their fleece. After this they fall to beat, to felt & thicken it close with their feet, then to card it with their nailes: which done, they draw it out at length, and hang it betweene branches of trees, and so kembe it in the end to make it thin and subtile. When al is brought to this passe, they enwrap & enfold themselves (as it were) in a round bal and clew of thread, and so nestle within it. Then are they taken vp by men, put in earthen pots, kept there warme, and nourished with bran, vntill such time as they haue wings according to their kind: and being thus well clad and appointed, they be let go to do other businesse. Now as touching the wooll or fleece which they haue begun, men suffer it to relent in some moisture, and so anon it is spun into a small thread, with a spindle made of some light Kex or Reed. This is the making of that fine Say, wherof silke cloth is made; which men also are not abashed to put on and vse, because in summer they would go light and thin. And so far do men draw back now a daies from carying a good cosset & armor on their backs, that they think their ordinarie apparell doth ouer-lode them. Howbeit, hitherto haue they not medled with the Assyrian Silkworme, but left it for the fine wines and dames of the city.

CHAP. XXIV.

¶ Of Spiders, and their generation.

It were not amisse to joine hereunto a discourse of Spiders, for their admirable nature, which deserues a speciall consideration. Wherin, this is first to be noted, that of them there be many kinds, and those so well known vnto euery man, that needles is to be particularize & stand much vpon this point. As for those which be called *Phalangia*, their stinging and biting is venomous, their bodie small, of diuers colors, and sharpe pointed forward; and as they go, they seeme to hop and skip. A second sort be black, and their feet are exceeding long. All of them haue in their legs, three joints, The least of this kind, called *Lupi*, spin not at all nor make any webs. The greater, stretch forth their webs before the small entries into their holes within the ground. But the third kind of Spiders, be they which are so wonderfull for their fine spinning and skilful workmanship: these weaue the great and large cobwebs that we see; & yet their very womb yeeldes all the matter and stuffe wherof they be made. Whether it be, that at some certain season naturally their belly is so corrupt (as *Democritus* saith) or that within it there is a certain bed (as it were) which engenders the substance of silke. But surely whatsoeuer it is, so sure and steadie nailes the Spider hath, so fine, so round, and euen a thread the spinnes, hanging thereunto her selfe, and vsing the weight of her owne bodie in stead of a wherue; that a wonder it is to see the manner thereof. She begins to weaue at the very mids of the web, and when she hath laid the warpe, brings ouer the woofe in compasse round. The meshes and marks she dispenses equally by euen spaces; yet so, as euery course growes wider than other, and albeit they do increase still from narrow to be broader, yet are they held and tied fast by knots that cannot be vndone. Mark, I pray you, how artificially she hides the snares in that net of hers, made into squares, to catch the poore flies. A man would not thinke (who sees the long yarne in her web wrought serce-wisely, smoothed and polished so cunningly, and the verie manner of the woofe so glewly and clammie as it is, of it selfe) that all were to any purpose, and serued for that which she

she intends. See withall, how slacke and hollow the net is made to abide the wind, for feare of breaking; and thereby so much the better also to fold and enwrap whatsoeuer comes within her reach! What a craft is this of hers to leane the vpper part thereof in the front vndone, as if she were wearie (for so a man may guesse, when he can hardly see the reason) and (as it is in hunters net and toile) that so soone as those nets be stumbled vpon, they should cast the flies headlong into the lap and concauitie of the net? To come now vnto her nest and hole: Is there any Architecture comparable to the vault and arched frame? And for to keep out the cold, how is it wrought with a longer and deeper nap than the rest! What subtiltie is this of hers, to retire into a corner so far from the mids, making semblance as though she meant nothing lesse than that she doth, and as if she went about some other businesse! Nay, how close lies she, that it is impossible for one to see, whether any bodie be within or no! What should I speak of the strength that this web hath to resist the puffs and blasts of winds; of the roughnesse to hold and not breake, notwithstanding a deale of dust doth weigh and beare it downe? Many a time ye shall see a broad web reaching from one tree to another: and this is when she learns to weaue & begins to practise and trie her skill. Shee stretches a thread, and warps in length from the top of the tree downe to the very ground; and vp again she whirles most nimble by the same thread: so as at one time, she spins and winds vp her yarne. Now if it chance that any thing light into her net, how watchfull, how quick sighted, how readie is she to run? Be it neuer so little snared euen in the very skirt and vtmost edge thereof, she alwaies skuds into the mids; for so by shaking the whole net, she intangles the flie or whatsoeuer it be, so much the more. Looke what is slit or rent therein, she presently doth mend and repaire, and that so euen and small, that a man cannot see where the hole was derved and drawne vp again. These Spiders hunt also after the yong Lizards: first they enfold and wrap the head within their web: then, they catch hold and tweek both their lips together, and so bite and pinch them. A worthy sight and spectacle to behold, fit for a king, euen from the stately Amphitheatres, when such a combat chanceth.

Moreover, there be many presages and prognostications depend vpon these Spiders: for against any inundations and ouerflowings of riuers, they weaue and make their cobwebs higher than they were wont. In faire and cleare weather, they neither spin nor weaue, vpon thicke and cloudie daies, they be hard at worke: and therefore many cobwebs be a signe of raine. Some thinke, it is the female that spins and weaues, and the male, which hunts and gets in the prouision for the familie: thus ordering the matter equally in earning their liuing, as man and wife together in one house. Spiders engender together with their buttocks; & little worms they do lay like eggs. For, considering that the generation of all Insects besides, in a manner can be declared and shewed no otherwise, I must not deferre the relation thereof, it being so admirable as it is. Well then, these eggs they lay in their webs, but scattering here and there, because they vse to skip and leap when they thrust them forth. The Phalangius only sits vpon the eggs within the very hole, and those in great number: which begin not so soon to peep, but they eat the mother, yea and oftentimes the father likewise, for he helps her also to cooue. And these kind of Spiders bring commonly 300 at a time: whereas all the rest haue fewer. They sit ordinarily thirtie daies. As for yong Spiders, they come to their full growth and perfection in foure weekes.

CHAP. XXV.

¶ Of Scorpions.

SEMBLably, the land Scorpions do lay certaine little worms or grubs in maner of eggs: and when they haue so done, perish likewise for their labour, as the Spiders. Their stings be as venomous and dangerous, as those of serpents: and albeit there ensue not thereupon so present death, yet they put folke to more paine a great deale; insomuch as they languish and lie drawing on three daies before they die. If a maiden be stung with one of them, she is sure to die of it: other women also for the most part catch their death thereby, and hardly escape. Yea and men also find their poison to be mortall & deadly, if they be stung in a morning by them when they creep newly out of their holes, fasting, & before they haue discharged their poison by pricking one thing or other first. Their sting lies in their tails, and readie they are with it alwaies to strike. There is not a minute of an houre but they practise and trie how they can thrust it forth, (so malicious they be) because they would not lose and misse the first opportunity presented vnto

A vnto them. They strike both sidelong or byas, and also crooked and bending vpward, with their taile. The poison that comes from them, is white, as *Apollodorus* saith, who also hath set downe 9 sorts of them, and distinguishing them by their colours, which me thinks, was but superfluous, and more than needed; considering that a man cannot know by his discourse, which of them he would haue to be least hurtfull and noisome. He affirmeth, that some haue double stings, and that the males are more curst and cruell than the females: for he auouches, that they do engender together, and that the males may be knowne by this, That they are long and slender. Moreover, that they be all of them venomous about mid-day, when they be enshaded and set into an heat, by the scalding and scorching sun: also when they be drie and thirstie, they cannot drinke their full and quench their drought. This is well known, that those which haue seuen joints in their tailles, be more fell than the rest: for it is ordinarie in them to haue but six. In Affrick, this pestilent creature vses to flie also, namely, when the Southerne winds blow, which carrie them aloft in the aire and beare them vp as they stretch forth their armes like oares. The same *Apollodorus* before named auouches plainly, that some of them haue very wings indeed. The people called *Plylli* (who making a gainfull trade and merchandise of it, to bring in hither vnto vs the poisons of other countries, and by that meanes haue filled Italie with forrein venomous beasts) haue many times assaied to bring them hither; but neuer would they abide so much as the aire of Sicilie, nor liue in that tract. Howbeit we see of them now and then in Italie, but harmlesse they be all: like as in many other places besides, and namely about *Pharus* in *Egypt*.

C In * *Scythia* they be so dangerous, that they kill their hogs; which otherwise be creatures that can eat such poisons, and yet liue and do full well. And if it be true that is said, the black swine die more speedily, especially if after they be stung, they goe into the water and drench themselves. If a man be stung with a Scorpion and drinke the powder of them in wine, it is thought to be present remedie. Men hold, that nothing is more contrarie vnto them than oile, if they be dipped therein: as also to the *Stellions*, which are made like Lizards, and do no hurt to them only, because they are without blood. Like as the Scorpions also are said to be harmlesse to anything that is bloodlesse. Some are of opinion, that they likewise deuoure their young, saue only one who is more slie and craftie than the rest, who gets upon the rumpe behind of the mother, and there sits, being assured that hee is safe enough in that place, both from sting of taile and tooth in mouth. This Scorpion reuenges the death of his other brethren and sisters: for in the end he skips vpon the backe of father and mother both, where he gnaweth and eateth them to death. To conclude, Scorpions vsually do breed eleuen young ones at a time.

CHAP. XXVI.

¶ Of Stellions and Grasshoppers.

THE *Stellions* after a sort be of the nature of *Chamaeleons*, liuing only vpon dew and Spiders. *Grasshoppers* liue also much after the same manner. And they be of two sorts, namely, the lesser, which come first, and die last; but those be mute. The latter breed, seldome or neuer flie: and those likewise are of two kindes. Such as sing aloud be named *Echetæ*; and the lesser sort of them *Tettigoniae*: but those other are more shrill, and chant full merrily. The male *Grasshoppers* in both kinds, do sing: the females are silent. The people of the East countries make their food of them: euen the very *Parthians*, who otherwise abound in wealth. The hee *Grasshoppers* are the sweeter meat before the time of engendering; and the shee *Grasshoppers* afterward, by reason of eggs knotted within them, and those be white. They engender with their bellies vpward. They haue a certain roughnesse vpon their backs, which is very sharp, and therewith they worke a hollow gutter in the ground, as a nest to lay their eggs and breed in. At the first, appeareth a little worne or maggot; whereof comes afterward that which they call *Tettigometra*, as one would say, the mother of *Grasshoppers*, or the great *Grasshopper*. For about the Sunstead in Summer, the vtmost crust or case thereof breaketh, and then out they flie, and alwaies in the night. At the first, blacke they be and hard withall. Of all creatures that are known to liue, the *Grasshoppers* alone haue no mouth: in stead whereof, they haue a certaine sharp pointed thing in their breast (like vnto their tongues that carrie stings in their mouthes) and with it they sucke and licke in the dew. Their breast is full of little pipes, from whence cometh that ringing noise of the *Echetæ* which we do heare, as I haue aboue said. Moreover, their bellie is

Ff

emptie

* Or rather in Caria.

emptie and hath nothing in it. When a man raifeth them, fo as they be thereby forced to flie, G they yeeld forth a certaine humor : which is the onely argument that they be nourished of the dew. They haue moreouer this one marke from all other liuing creatures, namely, no concan-
 rie of their bodie to be feene wherby to void out any excrements. So dimme. fighted they be, that if a man chance to come neare vnto them, plucking in and stretching out his finger before them, they will prefently leape vpon it, fupposing that it is fome leafe that waggeth. Writers there be, that make two more kinds of them, namely, the greater, which appeare at the first
 I spring and budding of trees ; wherupon it is called Surcularia : and a lesser, which some name Frumentaria, others Auenaria. For this sheweth it selfe when the corne is ripe and begins to die in the straw.

CHAP. XXVII.

¶ Places wherein there be no Grasshoppers : also where they are mute.

I N countries bare and naked of trees and wood, there breed no Grasshoppers: and therefore ye shall haue them at Cyrene, about the towne, but not in the plaines and fields thereof. Neither shall a man meet with them in woods that be cold and full of shade. It seemes also, that they take a liking to some one quarter more than another : for in the region of the Milefians, few places there be that haue them : but in Cephalenia, there is a riuer that doth limit and bound them : for of the one side there be plentie of them, and on the other, few or none. In the territo-
 I rie of Rhegium they be all mute. Passe the riuer once and come into the Locrians countrey ye shall heare them chaunt lustily. Wings they haue like to those of Bees, but larger, to the proportion of their bodies.

CHAP. XXVIII.

¶ The wings of Insects, and sundrie kinds of Beetles.

O F Insects, some carie two wings about them, as the flies : others foure, as Bees. As for Grasshoppers, they flie with wings made like pellicles or fine skins. In summe, all Insects which be armed with a sting in their bodie or taile, haue foure apeece : and none againe haue about twaine that carrie their offensiue weapon in their mouth. To the former, Nature hath giuen it for to reuenge ; to the other, only to feed themselves, and content their appetite. K Moreouer, plucke from any of them their wings, there will neuer come new in the place. None that haue a sting in their taile, be double winged. Some Insects there be, which haue growing a certaine husk or cod ouer their wings, for the safegard and defence thereof, as the Beetles: and the wings of such be thinner and more brittle than others. Sting they haue none, but a certaine kind of the great ones be armed with two long hornes boking out before them, and two forked they be and toothed like Pinsons, in the top, which (when they list) they can bring together and make them meet, and so nip and bite withall. These Beetles, folke vse to hang about the necke of young babes, as present remedies against many maladies. Such Beetles, *Nigidius* calleth Lu-
 L canes.ouer and besides, there is another sort, which tumbling vpon their back in dung, do roll it into great round balls with their feet, & therein do make nests for to bestow their little grubs (which are their young) against the cold of winter. Some there be that vse to flie vp and down, and where euer they go, make a great buzzing noise as if they lowed. Ye shal haue others again that keepe in medowes ; yea and Creckets that haunt the earth and stocke of chimnies, where they make many holes, and lie cricking aloud in the night.

The Glo-wormes, are named by the Greeks Lampyrides, because they shine in the night like a sparke of fire: and it is no more but the brightnes of their sides and taile: for one while as they hold open their wings, they glitter; another while when they keep them close together, they be shadowed and make no shew. These Glowbards neuer appeare before hay is ripe vpon the ground, neyer after it is cut downe. Contrariwise, the flies called Blattæ, liue and be nourished in darknesse : light is an enemy vnto them, and from it they flie. They breed commonly in
 M baines and stoues, of the moist vapors that be there. Of the same kind there be other great Beetles red in color, which work themselves holes in the drie earth, where they frame certaine receptacles like vnto Bees combs, little and small, full of pipes resembling hollow sponges; and

all

A all for a kind of bastard honey, whereof yet there is some vse in Physicke. In Thrace neare to Olynthus, there is a little territorie or plot of ground ; where this one creature (among all o-
 ther) cannot liue; whereupon the place is called Cantharolethus. The wings generally of all In-
 sects, be whole, without any slit: and none of them hath a taile but the Scorpion. Hee alone hath not only armes but also a sting in the taile. As for the rest, some of them haue a sharp pricked weapon in their muzzle, as namely, the Breefe or great Horle-flie, called in Latine *Astus* or *Tabanus*, whether you will. Likewise Gnats also, and some kind of flies. And these prickes serue them in good stead both for mouth and tongue. Some of these are but blunt, & not good for to pricke, but only handsome to sucke withall, as flies, which haue all of them a tongue, bee-
 B ing evidently fistulous and like a pipe. And none of all these haue any teeth. There bee Insects with little hornes proaking out before their eyes, but weake and tender they bee, and good for nothing ; as the Butterflies. And there be againe, that are not winged, and such be the Sco-
 lopendres. All Insects that haue legges and feet, goe not directly, but bias and crooked. Of which, some haue the hinder legges longer than the former, and such bend hooked outward ; as the Locusts.

CHAP. XXIX.

¶ Of Locusts.

T He Locusts lay egges in Autumne, by thrusting downe into the ground the fistule or end of their chine, and those come forth in great abundance. These egges lie all winter long in the earth; and at the end of the spring the yere following, they put out little Locusts, black
 C of colour, without legs, and creeping vpon their wings. Hereupon it commeth, that if it be a wet spring and rainie, those egges perish and come to no good : but in a drie season, there will be greater increase and store of Locusts the Summer ensuing. Some writers hold opinion, that they lay and breed twice a yere : likewise that they perish and die as often. For they say, that when the star Vergilia doth arise, they breed: and those afterwards about the beginning of the Dogdaies, die; and others come in their place. Others say, that they engender and breed againe their second litter, at the full or setting of Arcturus. True it is indeed, that the mothers die so
 D soone as they haue brought forth their little ones, by reason of a small worme that presently breeds about their throat, which chokes them. And at the same time, the males likewise mis-
 carrie. See what a little matter (to speake of) brings them to their death ! and yet a wonder it is to consider, how one of them when it list will kill a serpent : for it will take him fast by the chawes, and neuer lin biting till he hath dispatched him. These little beasts breed no where but in plain and champion countries, namely, such as be full of chinks and creuises in the ground. It is reported, that there be of them in India, three foot long : where the people of the country vse their legs and thighs for sawes, when they be thoroughly dried. These Locusts come by their death another way, besides that aboue-named: for when the wind takes them vp by whole
 E troupes together, they fall downe either into the sea, or some great standing pooles. And this many a time happens by meer chance and fortune; and not (as many haue supposed in old time) because their wings are wet with the night dew. For euen the same Authors haue written, that they flie not in the night for cold. But little know they, that it is ordinarie with them to passe o-
 uer wide and broad seas, and to continue their flight many daies together without rest. And the greater wonder is this, that they know also when a famine is toward: in regard whereof, they seek for food into far countries: in such sort, as their coming is euer held for a plague of the gods, proceeding from their heauie wrath and displeasure. For then commonly they are bigger to be
 F seen, than at other times : and in their flight they keepe such a noise with their wings, that men take them for some strange fowles. They shade and darken the very Sunne as they flie, like vn-
 to a great cloud: in so much, as the people of euery country behold them with much feare, least they should light in their territorie, and ouer-spread the whole countrey. And verily their strength is such, that they hold out still in their flight: and as if they had not enough of it to haue flowne ouer seas, they giue not ouer to traueserle mightie great countries in the continent. And looke in what place soeuer they settle: they couer whole fields of corne with a fearefull and terrible cloud: much they burne with their very blast, and no part is free but they eat and gnaw euen the very dores of mens dwelling houses. Many a time they haue been known to take
 Ff 2 their

their flight out of Affrick, and with whole armies to infest Italie: many a time haue the people of Rome, fearing a great famine and scaritie toward, been forced to haue recourse vnto Sybils books for remedie, and to auert the ire of the gods. In the Cyrenaicke region within Barbarie, ordained it is by law, euery three yeares to wage war against them, and so to conquer them: that is to say, first to seeke out their nests, and to squash their eggs; secondly, to kill all their yong; and last of all, to proceed euen to the greater ones, and vtterly to destroy them: yea, and a greuous punishment lieth vpon him that is negligent in this behalfe, as if he were a traitor to his prince and country. Moreouer, within the Island Lemnos there is a certaine proportion and measure set down, how many and what quantitie euery man shall kill; and they are to exhibit vnto the magistrate a iust and true account thereof; and namely to shew that measure full of dead Locusts. And for this purpose they make much of Iaies, Dawes, and Choughes, whom they doe honour highly, because they flie opposite against the Locusts, and so destroy them. Moreouer, in Syria they are forced to leue a warlike power of men against them, and make rid-
 dance by that meanes. See in how many parts of the world this hurtfull and noisome vermine is disperfed and spread: and yet in Parthia they are taken for very good meat. The voice that they haue (such as it) seemes to come from the hinder part of their head: for about that place where the jointure is of the shoulders to the nape of the neck, they are thought to haue certain teeth, which by grating and grinding one against the other, doe yeeld a kind of crashing noise: and namely, about the time of both the *Æquinoctials*: like as the Grasshoppers at midsummers Sunstead, Locusts engender after the manner of all other Insects which do engender: to wit, the female carries the male; and she lying vnderneath, bends vp the very end of her taile against the other: and thus they continue a good while ere they part asunder. To conclude, the males of all this kind be lesse than the females.

CHAP. XXX.

¶ Of the ordinarie Pismires of our country in Italie.

Most part of Insects do breed a grub or little worme. For euen the very Ant in the Spring time doth bring forth such wormes like egges. These filie creatures labor and trauell in common, as the Bees do: this only is the difference, that Bees do make their owne meat, whereas these fore vp only their food and prouision. As touching their strength, if a man would compare the burdens that they carie, with their own bodies, he wil find and confesse, that there is not a creature againe in the world, for that proportion, stronger. And how doe they carrie them? euen with their very mouthes. Howbeit, if they meet with any greater load than they can bite betwene their chawes, then they set their shoulders to it, and with their hinder legs also make meanes to driue it forward. They haue among them a certaine forme of Common-wealth: they remember: they are not without care and fore-cast. Looke what feedes or graines they do lay vp for prouision, sure they will be to gnaw it first, for feare they should sprout and take root againe, and so grow out of the earth. If a corne or seed be too big for their carriage, they diuide it into peeces, that they may go with it more easily into their house. If their seeds within, chance to take wet, they lay them abroad, and so drie them. They giue not ouer worke by night, when the Moone is at the full: but when she is in the change, they rest and play them. When they are at worke, how painfull are they? how busie, how industrious? And for as much as they make their puruicance in diuers places, and bring from al parts, without knowledge one of the other: they keepe among them certaine market daies, for a mutuall enteruiew and conference together. And verily, it is a world to see, how then they will assemble; what running, what greeting, what entercourse and communication there is between them, whiles they are inquisi-
 tiue, as they meet one with another. What newes abroad: euen like merchants at a Burse. Their waifare is so ordinarie and continual, that we may see the very hard flint and pebble stones worn with their passage too and frome may see (I say) a very path-way made where they vse to goe about their worke: whereby, let no man doubt of what force and power continuall vse is, of any thing whatsoeuer, be it neuer so little. Of all liuing creatures, they only and men, doe enterre and burie their dead among them. To conclude, thoroughout all Sicilie a man shall not see a flying Ant.

CHAP.

CHAP. XXXI.

¶ Of Indian Pismires.

IN the temple of *Hercules* at Erythra, there were to be seen the horns of a certain Indian Ant, which were there set vp and fastned for a wonder to posteritie. In the country of the Northern Indians, named *Darda*, the Ants do cast vp gold about ground from out of the holes and mines within the earth: these are in colour like to cats, and as big as the * wolues of *Ægypt*. This gold before said, which they worke vp in the winter time, the Indians do steale from them in the extreme heate of Summer, waiting their opportunitie when the Pismires lie close within their caues vnder the ground, from the parching Sun. Yet not without great danger: for if they happen to wind them and catch their sent, out they go, and follow after them in great hast, and with such fury they fly vpon them, that oftentimes they teare them in pieces; let them make way as fast as they can vpon their most swift camels, yet they are not able to saue them. So fleet of pace, so fierce of courage are they, to recouer gold that they loue so well.

CHAP. XXXII.

¶ The diuers generation of some Insects.

MAny Insects there be that breed after another sort than the former about specified: and principally of dew which settles vpon the radish leafe in the beginning of the Spring. For being made thicke, and hardned with the heate of the Sun it growes to the bignes of the grain of Millet. From it ariseth a little grub, and three daies after it becomes a kind of canker-worme: and so in processe and tract of time it groweth bigger without mouing at all, and gathereth an hard husk or case about her: only if a man touch the webby panicles wherein the said worme lieth inwrapped, it will seem to stir. This is called *Chrysalis*: and after some time, when the kex or husk is broken, he proueth a faire flying butter-fly.

CHAP. XXXIII.

¶ Of Insects that breed in wood, and of wood.

Semblably there be some Insects ingendred of raine drops standing vpon the earth, and others also of wood: for not only the ordinarie wood-wormes breed in timber, but also certain Brees and horse-flies come of it, yea, and other such like creatures, whensoever the wood happen to be dotted with ouer-much moisture. Like as within one of our bodies there haue bin found broad wormes of 30 foot in length, yea and sometimes longer. Also there haue bin seen in dead carions many worms: and the very flesh of liuing men is apt to breed such vermin: and so is the haire of the head to harbor lice, of which filthy & loathsome creatures both *Sylla* the Dictator, and also *Alcman* (one of the most renowned Greeke Poets) perished. Moreouer, birds are much infested and troubled therewith. And as for Feasants, they will dy thereof vnlesse they bestrew themselves with dust. Of such beasts as carry haire, it is verily thought that the Ass alone and sheepe are free from this kind of vermin. Some kind of cloath likewise is apt to ingender lice, and especially those which are made of wooll that sheepe bare which were worried of wolues. Our and besides, I find in some writers, That there is some water will ingender this vermin if we do but waile therein. For euen in wax there will breed mites, which are thought to be of all creatures that haue life, the very least. Also ye shall haue others again ingender of filthy dry dust, namely fleas, which vse to skip and hop with their hinder feet lustily like these tumblers and vaultors. Last of all, there be that come of a certaine moist powder in canies of the ground, and those be our ordinarie little flies.

CHAP. XXXIV.

¶ Of one kind of creature that hath no passage to void excrements.

THere is a creature as foule and ill-fauoured as the rest, which hath euermore the head fast sticking within the skin of a beast, and so by sucking of bloud liueth, and swells withall: the only liuing creature of all other that hath no way at all to rid excrements out of the bodie.

body: by reason whereof when it is too full, the skin doth crack and burst, and so his very food is cause of his death. In Horses, Asses, and Mules these do neuer breed: in Kine and oxen they be common, and otherwhiles in dogs, who are pestered not only with these ticks, but also with all other vermine aboue named. And in Sheepe and Goats a man shall finde none other but ticks. It is as strange a thing also to see, how the horse-leeches which be nourished in standing waters of fens, are thirsty after bloud: for these will thrust their whole head into the flesh, for to draw and suck out bloud. Finally, there is a kind of flies that plagueth dogs and none else: they are busie commonly about their eares, where they will bite and sting them shrewdly; for there they cannot come by them with their teeth to snap and kill them.

CHAP. XXXV.

¶ Of Moths and Gnats.

Wool and cloth when they be dusty breed moths, especially if a spider also be gotten within them. For the Spider is very thirsty; and by reason that he drinketh vp all the moisture of the cloth or wool, he increaseth the driness much more. In paper also they will ingender. A kind of them there is which carry their coats and cales with them, as cockles and snails do; but they haue feet to be seen. If they be turned out of their coats or husks, they presently die. If they grow still they wil proue to be Chrysalides. The wild fig tree breeds certaine Gnats called Ficarij. As for the Cantharides or French Greene Flies, they be bred of little wormes in Fig trees, Peare trees, wilde Pines, or Pitch trees, the Eglantine Brier, and Roses. A venomous vermin this is, howbeit medicinable in some sort. The wings be they that are good in physick: cast them away, & the rest is deadly. Moreouer, there be other gnats that soure things will ingender. And no maruell, seeing there be some wormes found in snow, which are white, if the snow be but thin and new fallen. But in case it haue lien long, and bee deep, a man shall find in the mids within those which are red (for snow also if it be old waxeth red) rough and hairy, greater also than the rest, and dull of motion.

CHAP. XXXVI.

¶ Of the fire-fly called Pyralis, or Pyrausta.

The fire also, a contrary element to generation, is not without some liuing creatures ingendred therein. For in Cypres, among the forges and furnaces of copper, there is to be seen a kind of four-footed creature, and yet winged (as big as the greater kind of flies) to flie out of the very midst of the fire, and called it is of some Pyralis, of others Pyrausta. The nature of it is this: so long as it remaines in the fire it liues: but if it chance to leap forth of the Furnace, and fly any thing farre into the aire, it dieth. There is a riuer in the kingdome of Pontus called Hypanis, which about the summer Sunstead vseth to bring down the streame thin pellicles or bladders like to grape kernels: out of which there breaks forth and issueth a foure footed flie, like vnto those aboue named; and it liueth not aboue one day, whereupon it is called Hemerobion [*i. a day-fly.*] All other Insects of like sort may continue and liue a seuen-night. The Gnat and the little wormes three weeks: but such as bring forth their yong aliue, may endure a full moneth. As for the metamorphosis of these creatures from one forme to another, it is most commonly performed in three daies, or foure at the most. All the rest of the winged kind lightly die in Autumne: among which, the breees and horse-flies are ordinarily blind first. To be short, those flies which haue bin drowned, and so come to their death, if they be laid and kept in hot cinders or ashes, will come again to themselves and reuiue.

CHAP. XXXVII.

¶ A discourse Anatomicall, of the nature of liuing creatures part by part, according to their particular members.

The head.

It remaines now to treat of the seuerall parts of the body, and ouer and aboue the former description, to particularize and set down the story of one member after another. First therefore this is generall, that all liuing creatures whatsoeuer hauing bloud, haue also heads: and few

A few of them haue cops or crested tufts vpon their heads, vnlesse it be birds, and those be of diuers forms and fashions. The Phœnix is adorned with a round plume of feathers, out of the midst of which growes another little pennache. Peacocks carry vpon their heads a tuft (as it were) of little hairy trees: and the Stymphalides a lock of crisped and curled haire. Peasants haue feathers standing vp like hornes. The pretty Titmouse or Nonett is filleted or coifed vpon the head: and in lieu thereof, the Lark hath a little peruke of feathers, whereupon at first it was called Galerita, but afterwards after the French word Alanda, and of it one of the Roman legions tooke the name, because of their pointed Morions. We haue written alreadie of the Ginny or Turkey cocks and hens, vpon whom Nature hath bestowed a folding crest, lying from the very bill, ouer the midst of the head, vnto the nape of the necke. She hath giuen also vnto all the sort of Seamewes, Fen ducks, and Moore-hens, certain cops and crisped tufts to the Woodpeck also and Balcare crane. But aboue all others, the house dunghill cocks carry vpon their heads the goodliest ornament of their combe, and the same consisting of a masse and fleshy substance, indented besides like a saw. And yet we may not properly say it is either flesh, gristle, or callositie, but composed of some particular matter by it selfe, which cannot well be named. As for the crests of dragons, I could meet with no man hitherto that euer saw them.

To come now to Hornes, there be many fishes, as well of the sea as fresh waters, and also Serpents, that haue horns in diuers and sundry sorts. But to speak a truth and properly, they be no hornes indeed, for those pertain only to four-footed beasts. As for *Aëdon* and *Cippin*, of whom we read in our Latine story that they had hornes, I take them to be meer fables and no better. Certes in nothing more hath Nature taken her pleasure than in this, as if she had meant to delight and sport her selfe in these armes and weapons of beasts. For in some she hath made them knagged and branched, as in Deere, both red and fallow: in others plain and vniforme without rines, as in the Spitters, a kind of Stag, which thereupon be called Subulones in Latin, for that their hornes be like a shoemaker's * Nall blade. There be againe which haue broad hornes, and plaited like a mans hand, with fingers standing out of them: whereupon the beasts that beare them be called Platycerotes, [*i. broad horned.*] Roe bucks haue by nature branched heads, but they are small: and these do not mew and cast them yearely, as the stag and bucke. All the sort of rams be armed with crooked hornes, turning and winding with certain revolutions as if they were gantlets or whorle bats, giuen them by nature to thumpe and jurre withall. Bulls hornes be strait and vpright, ready alwaies to do a mischief. The females of this kind, to wit, Cowes, are horned as well as Bulls: whereas in many others, the males only be in that wise armed. The wild Goats, called Roch-goats, haue their hornes turning backward, whereas in fallow Deere they bend rather forward. There is a kind of Roe-buck called in Africke Addace, which the Greeks haue named Strepsiceros, and they haue vpright hornes: but they are furrowed and wreathed round about as if they were ribbed like the backe of a lute; or rather chamfered like the ridge of a land, and alwaies sharp pointed with a tip. Ye shall haue droues and herds of beasts, namely Kine and Oxen in Phrygia, which wil stir and wag their hornes like eares: and those in the kingdome of the Troglodites, carry their hornes pendant directly to the ground, which is the cause, that as they eat they are forced to beare their necks awry, and looke at one side. Some haue but one horne apiece, and that either in the midst of the forehead, as the Oryx; or else in the nose and muffle, as the Rhinoceros, whereof we haue written before. In sum, there be that haue strong and hard hornes to butt with: others to strike and gore withall: some crooking forward, others bending backward. In some, they are good only to tosse and fling, and that in diuers manners. For there be of them that giue back, others turn one against another, and some euen ioyned and meet together: but all run vp sharp pointed in the end. A kind of beasts there is that vse their hornes in stead of hands to scratch their body when it itches: and others serue the turn to found the way before them, as certain shell-Snails and Winkles. And these hornes giuen for this purpose are some of them of a fleshy substance, as those of the serpents called Cerastræ: and otherwhiles one alone without a fellow. As for the Periwinkles and Snails aforesaid they are neuer without twain apiece: and at this passe they haue them, to put out and draw in as they list. In Buffles hornes the barbarous people of the North parts vse to drinke: and ye shall haue the hornes of one Buffle head to hold full two measures called Vrna, which is about 8 gallons. In some countries men head their speares and jauelins with horne. With vs in Italy they be cut into thin plates, and serue for lanterns: and surely they are so transparent and cleare, that they make

make the candle within inclosed to cast the greater light, and farther off. Nay, they are good for many other toies of delight and pleasure: inso much as some paint and die them with sundry colours, others vernish and anneile them: and ye shal haue men to make thereof their fine inlaid works in Marquetrie of diuers colours, called thereupon Cerostrata. All horns in manner be hollow, saue that as they grow toward the pointed tip, they be solid and massie: onely Deers both red and fallow are found and entire throughout: and euery yere they fall off. Husbandmen in the country, when they see their Oxe hooves surbatted and worn too neere the quick with ouermuch trauell, anoint their hornes with sweet grease, & that is the way to make them grow again. And in very truth the hornes of these beasts are of so pliable a substance, and easie to be wrought, that as they grow vpon their heads, euen whiles the beasts are liuing, they may with boiling wax be bended and turned euery way as a man will: yea, and if they be cut when they break new forth out of the skin, they may be easily writhed to grow seuerally in sundry parts, so as euery head may seem to haue foure hornes. For the most part, the hornes of Cowes are more tender and thinner than the other; like as we see it is in the females of smaller beasts: * Ewes haue none at all: ne yet Hinds and Does: no more than the beasts that haue feet clouen & diuided into many toes: or those that be whole hoofed, except the Indian asse, who is armed with one horne and no more. Beasts clouen footed in twaine haue likewise two hornes: but none at all haue they which are toothed in the vpper mandible. They that make this reason, because the matter of their teeth runs al into the horn, and so contrariwise, are deceived, and soon conuincid by this, That Hinds & Does are toothed, no more than Stags and Bucks, and yet are not horned. In other beasts the hornes grow to the very bone of the head, in Deere only they come out of the skin, and are grafted no deeper. Fishes of all liuing creatures haue the biggest heads for the proportion of their bodies, haply because they might the better diue vnder water and sink to the bottom. No kind of Oisters haue any head at all, no more than Spunges, or any other in manner, which want al their senses but only feeling. Some haue heads indeed, but within their body, and not diuided apart from it, as Crabs and Creifishes.

Mankind of all liuing creatures hath most haire on the head, euen men as much as women, as we may see in those countries where they neuer cut their haire, but let it grow. And namely in Sauoy, Dauphine, and Languedoc about the Alps, where men and women both weare long haire, and thereupon that part of France is called Comata. And yet this is not for general, but that the nature of some land and soile may make some alteration and varietie. For the Myconians naturally haue no haire at all: like as the Caunians be all subiect to the disease of hard and swelling spleens, euen from their mothers womb. Some reasonlesse creatures likewise are by nature bald, as Ostriches, and certain * water Rauens, which of the Greeks are named thereupon Phalacrocoraces. Seldom downen shed their haire clean, and become bald: but neuer was any gueldded man knowne to be bald: nor any others that be pure virgins, and haue not sacrificed vnto Venus. The haire growing beneath the ventricles of the brain, & vnder the crown of the head, like as also about the temples and eares, falls not off quite. Man alone of all creatures groweth to be bald, I speake not of those that are so by nature. Men, women, and horses wax gray haired. Men and women both begin at the forepart of their heads to be grislic, and afterwards behind. Men and women alone be double crowned.

Some creatures haue the bones of their skull flat, plain, thin, and without marrow, and the same vnited or ioined together by certain sutures or seams indented & toothed on either side, which run one into another. The ruptures and cracks of the brain pan cannot be consolidated and fauded perfectly again: but if the spels and pieces be gently taken out, and but smal, there is no danger of death: for in their place there will grow a certaine callous cicatrice or fleshie substance that will supply in some sort that defect. Bears of all others haue the tenderest sulcs, and Parrats the hardest, as we haue said before in place conuenient.

Moreover, all liuing creatures that haue blood haue likewise brains: yea, & those in the sea which we call Soft-fishes, although they haue no blood at all, as namely the Pour-cuttes or Polypes. But man for his bignes and proportion hath most braine of all other, and the same is the moistest & coldest part he hath within his body. Infolded it is within two tunicles or kels, both aboue and beneath: whereof if the one be pierced and wounded [to wit, *Piamater*] there is noway but present death. Also, men commonly haue more braines than women. And both of them haue neither blood nor veines therein: as for that which is in other creatures, it wanteth

A wanteth all kind of fat. The learned Anatomists, who haue searched diligently into the nature of things, do teach vs a difference between the brain & marrow of bones: for, brains in the boyling and seething, wax hard. In the midst of the braine of all creatures there be certaine little * bones. Man alone in his infancie hath his brain to pant and beat: and fully settled it is not, nor confirmed, before that he begins to speak. Of all parts necessary for life, it is placed highest, and next vnto the cope of head and heauen both: without flesh, without blood, without filth & ordure. And in truth, it is the fort and castle of all the senses: vnto it all the veines from the heart do tend: in it they all do likewise end. It is the very highest keep, watch-tower, and sentinell of the mind: it is the helme and rudder of intelligence and vnderstanding. Moreouer, in all creatures it lieth forward in the front of the head: and good reason, because all our senses bend that way just before our faces. From our braine comes sleepe, from thence proceedeth our nappes, our nods, our reeling, and staggering. And looke what creature fouer wanteth braine, the same sleepeth not. Stags (by report) haue within their heads twentie little wormes, to wit, in the concavity vnder their tongue, and about that iointure where the head is grafted to the chin bone.

Man alone hath not the power to shake his eares. Of flaggie, long, and hanging eares, came the surnames first of the *Flacci* (families & houses in Rome.) There is no one part of the bodie costeth our dames more than this, by reason of their precious stones and pendant pearls thereat. In the East countries, men also as well as women, think it a great grace and brauery to weare earrings of gold. As touching their proportion, some creatures naturally haue bigger or lesser than others. Deere only, the fallow as well as the red, haue them slit and as it were diuided. In Rats and mice they be hairy. To conclude, no creature hath ears but those that bring forth their yong aliue: and none of them are without, saue onely Seales, Dolphins, Vipers, and such fishes as were called Cartilaginous and gristly. And these all in stead of ears, haue certaine holes, or conduits, except the foresaid gristly fishes, & the Dolphins: and yet manifest it is, that they do heare wel enough. For delighted they be with musick: and vpon some great noise and sudden crack they are astonished, and then easily taken. But maruel it is how they should heare as they do: neither can I comprehend the reason and means thereof, no more than I am able to shew how they do smell: for no Organs and Instruments haue they thereof to be seene, & yet there is not an hound vpon the land sents better, nor hath a finer nose than they. Of all fouls, the Like-owle and the Otus alone, haue feathers like eares: the rest haue only holes to heare by. And after the same manner scaled fishes and serpents. In Horses, Mules, & Asses, and all such as serue either pack or saddle, the eares are tokens of their courage more or lesse, and will shew what stomach is within them. If they be tired and weary, they hang down flaggie: be they afraid, you shall perceiue them to wag too and fro: in heat of fury they stand pricking vp: in sicknes they lie downe.

Man only of all creatures hath a Face and Visage: the rest haue either muzzles and snouts, or else bills and beakes. Other creatures haue Foreheads also as well as men: but in mans alone we may see & reade sorrow & heauinesse, mirth and joy, clemencie and mildnesse, cruelty, and seuerity; and in one word, guesse by it, whether one be of a good nature or no?

In the ascent or rising of the forehead, man hath Eie-brows set, like to the eaves of an house, which he can moue as he list, either both at once, or one after another: and in them is shewed part of the mind within. By them we denie, by them we grant. These shew most of all others, pride and arrogancie. Wel may it be that pride doth appeare and settle in some other part, yet here is the seat & place of residence. True it is, that in the heart it begins, but thither it mounteth and ascendeth, here it resteth and remaineth. No part can it find in the whole body more eminent and haughty, and withall more steepe than the browes, wherein it might rule and raigne alone without controlment.

Next vnder the browes is the Eie, the most precious member of the whole body; which by the use of sight makes difference between life and death. Yet hath not Nature giuen eyes to all creatures: Oisters haue none: and for some other shel-fishes, it is hard to say whether they haue any or none. As for Scallops, if a man stir his fingers against them as they lie gaping open, they wil shut, as if they saw. And the shel-fishes called Solenes, giue backe if any edge-toole come neere vnto them. Of foure-footed creatures, Moldwarps see not at all: a certaine shew and forme

The Eie.

forme they haue of eies to be seen, if a man take off the skin that lieth ouer the place. Moreover, among fouls of the aire, those of the Herons kind, which are called Leuci, for that they be white, want (by report) one eie. And for certaine, in case of Augurie, if these birds flie either into the South or North, it is holden for an excellent good presage, for they assure men that peril is past and promise securitie. *Nigidius* affirmeth, That neither Locusts nor yet Grasshoppers haue eies. As for snailles and such like, the two little horns that they put forth, serue them in stead of eies, as they sound or trie the way before them. The earth-mads and all the sort of worms & grubs, are without eies. Men alone of all liuing creatures haue eies of diuers colours, some of one, and some of another. For all other creatures of one and the same kind, are eied alike. Howbeit, some horses there be that extraordinarily haue *red eies. But in men it is hard to set down the infinit variety and difference in them: for some haue great glaring eies: others againe as little & as pin-king. Others also there be that haue them of a moderate and reasonable bignesse. Some be goggle eied, as if they would start out of their heads, and those are supported to be dim-sighted: others be hollow eied, and they are thought to haue the best and clearest sight: like as they who for colour haue goats eien. Moreover, ye shall haue some men, who can discern a far off: others againe that see not but neere at hand. Many there are, whose eiesight dependeth of the Sunnes light: for let the day be ouercast and cloudy, or the Sun gon downe, they see just nothing: and others contrariwise there be, that all the day time haue but a bad sight; yet in the night season they see better than any others. As concerning 2 balls or apples in one eie, as also who they bee that can bewitch and hurt folk with their very eie, sufficient hath bin said already. *Gray eies commonly in the dark see more cleare than others. It is reported of *Tiberius Caesar* the Emperor to haue had this property by himself, that if he were awakened in the night, for a while he could see euery thing as well as in the cleare day light; but soon after, by little and little, the darknesse would ouercast and shadow all againe: a gift that no man in the world was euer known to haue but himselfe. *Augustus Caesar* of famous memory, had *red eies like to some horses; and indeed wall-eied he was, for the white thereof was much bigger than in other men: which also was the cause, that if a man looked earnestly vpon him, and beheld him wistly (and a man could not anger him worse) he would be displeased, & highly offended. *Claudius Caesar* had a fleshy substance about the corners of his eies, that tooke vp a good part of the white, and many times they were very red and bloud shoten. *C. Caligula* the Emperor, his eies were euer set in his head, and stiffe againe. *Nero* had a very short sight; for vnlesse he winked (as it were) and looked narrow with his eies, he could not well see ought, were it neuer so neere. Twentie couple of professed masters of fence and sword-plaiers there were in the fence-school, that *C. Caligula* the Emperor maintained: & among therest two there were & no more, whom a man could not make to winke, or once to twinkle with their eies: present before them what weapon he would, or make offer to strike, so steady & firm were they: and therefore they euermore carried the prize, & were inuincible. So hard a matter is it for a man to keep his eies from twining: and many men naturally cannot chuse but be euermore winking and twinkling with their eies: but such are holden for fearful and timorous persons. None haue their eyes all of one color: for the bal or apple in the midst is ordinarily of another color than the white about it. Neither in any one part of the body are more signes and tokens to be gathered of the affection and disposition of the heart, than in the eie, of man especially about all other creatures. By it we may know whether one be modest, staied, sober, gentle, mild, pittifull or no. It sheweth malice, hatred, loue, heauinesse, sorrow, and joy. In the cast also of the eie there is as much variety, for some haue a furious, cruell, terrible, fierce, sterne, and fierie looke: others shew grauitie and constancie in their eie. Some haue an ouerthwart regard with them, others looke askew and awry. One while a man looks atone-side, and bath a wanton sheeps eie: another while he casteth his eie downe, and looks heauily: and when he list againe, hee can giue one a pleasant and merry looke. In briefe, the Eies are the very seat and habitation of the minde and affection. For one while they be ardent and fierie: otherwhiles they be bent and fixed vpon a thing: one while they twinkle, another time they winke close and say nothing. From them proceed the teares of compassion: When wee kisse the eie, we thinke that we touch the verie heart and soule. From hence commeth our weeping: from hence gush out those streames of water that drench and run downe the cheeks. But what might this water and humour be, that in the hearts grieve issueth in such plentie, and is so ready to flow? Where may it lie at other times, when we are in joy, in mirth, and repose? it cannot

A cannot be denied, That with the Soule we imagine, with the minde we see, and the Eies as vessels & instrumens receiuing from it that visuall power and faculty, send it soon after abroad. Hereupon it commeth, that a deep and intentiue cogitation blinds a man so, that he seeth not; namely, when the sight is retired far inward. Thus it is, that in the Epilepsie or Falling-sicknes the eies are open and yet see nothing: for why? the mind within is darkened. Moreover, Hares haue this qualitie, to sleep open eied: and so do many men besides them: and this the Greekes do expresse by the terme *apocarni*. Nature hath framed and compounded the eie of many thin membranes or skins. As for those tunicles without-forth, they are rough and hard *like horn, to withstand the iniuries of heat and cold: and those she hath ordained eftsloones to be clenfed and purified with the moisture of teares; to the end that they should be slipperie and moueable, for to turne quickly and to shift from all that may offend. As for the middle part & membrane of the eie, she hath set in a ball, like a window made of transparent horne [or rather of a grape:] the little compasse whereof containeth all the sight of the Eie, and sufficeth it not to wander and roll here and there, but directeth it as it were within a certaine pipe or small conduit: by which means also (to note by the way) the apple being gathered into so narrow a circle, doth easily auoid all inconueniences that are incident vnto it, for to annoy the same. This ball and point of the sight is compassed also round about with other circles of stidry colors, black, blewish, tawny, russet, and red: to the end that by this medley and temperate mixture of colors enuironed with the white besides, the light might be let in & represented to the Optick-sinew: and also by a temperat reuerberation and beating backe from those other colours; it should not dazle or offend the apple with the exceeding brightnesse thereof. In sum, this mirror or glasse-window, is so perfect and so artificially contriued, that as little as the ball of the sight is, a man may see himselfe full and whole in it. And this is the cause that many fouls, from a mans fist are ready to peck at the eies aboue all other parts, for that they would gladly sort and draw vnto their owne representation and image, which they see in the eies, as vnto that which they naturally affect. Certain sumpter-horses and mules, & such like beasts of carriage only, are troubled with sore eies, and diseased that way at euery change and increase of the Moon. But man alone, in the catarrha & suffusion of the eie, by voiding from it a certain humor which troubled the sight, doth recouer and see againe. There haue bin many known blind 20 yeares and more, & yet afterwards inioied the benefit of their eies. Some haue bin borne blinde, without any fault or defect of their eies. Diuers men likewise haue suddenly lost their sight by some secret accident and no outward offence knowne to giue occasion thereof. Many right skilfull masters in Chirurgerie, and the best learned Anatomists are of opinion, That the veins of the eies reach to the braine. For mine owne part, I would rather thinke that they passe into the stomacke. This is certain, I neuer knew a mans eie pluckt out of his head, but he fell to vomiting vpon it, & the stomack cast vp all within it. We that be citizens of Rome, haue a sacred and solenne manner and vse among vs, To close vp their eies that lie a dying, and are giuing vp the Ghost; and when they be brought to the Funerall fire, to open them againe. The reason of this ceremonious custom, is grounded hereupon, That as it is not meet for men aliuie to haue the last view of a mans Eie in his death, so it is as great an offence to hide them from heauen, vnto which this honor is due, & the body now presented. Man alone is subiect to the distortion & depraued motion of his eies. Hereof are come the surnames of certain families in Rome, *Sirabones* & *Patti*: for that the first of those houses were squint-eied, and had rolling eies. Those that were borne blink but with one eie, our countrymen called *Codites*: as also them that were pinke-eied and had very small eies, they termed *Ocelle*. As for such as came by those infirmities by some iniurie or mischance, they were surnamed *Lucini*. Moreover, we see that those creatures which ordinarily do see by night (as Cats do) haue such ardent and fierie eies, that a man cannot indure to look full vpon them: The eies also of the Roe-bucke and the Wolfe are so bright, that they shine againe, and cast a light from them. The sea-calues or Seales, and the Hyenes, alter eftsloones their eies into a thousand colours.ouer and besides, the eies of many fishes do glitter in the night, when they be drie: like as the putrified and rotten wood of some old trunk of an oke or other wood. We haue said before, that those winke not nor shut their eie-lids, who cannot roll their eies atone-side, but are faine to turne their whole head withall when they would see a thing that is not iust before them. The Cham-eleons (by report) rol their eies all whole euery way as they list, vp and downe, too and fro. Crabs looke awrie And yet such fishes as are inclosed within a brittle

brittle and tender shell, haue their eies inflexible & stiffe. Lobsters and Shrimpes for the most part, haue their eies standing out very hard, albeit they be couered with the like shells. Those that haue hard eies, are not so well sighted as those that haue moist. It is commonly said, that if a man pluck the eies out of the heads of yong serpents, or yong Swallows, they wil haue new again in their place. All Insects and other creatures that lie within hard shells, stir their eies as four-footed beasts do their ears: but in those that haue tender shells, their eies be hard. And all such, as also fishes & Insects, haue no lids to their eies, and therefore couer them not. But there be none without a thin membrane or pellicle ouer them, which is cleare and transparent like glasse.

Men and women haue haire growing on the brims of both Eie-lids: but women do colour them euery day with an ordinarie painting that they haue: so curious are our dames and would so faine be faire & beautiful, that forsooth they must die their eies also. Nature ywis gaue them these hairy eie-lids for another end, namely, for a palaisade as it were & rampier of defence for the sight, yea and to stand out like a bulwark for to keep off and put by all little creatures that might come against the eies, or what things fouer els should chance to fall into them. Some write, That the haire of the eie-lids will shed and fall away, but not without some great injury, and namely, in such persons as be ouermuch giuen to lecherie. No other liuing creatures haue these haire, but such as otherwise be clad all ouer their bodies with haire or feathers. But, as four-footed beasts haue them in the vpper lid only, so Fouls haue none but in the nether: like as those serpents which are tender skinned and four-footed, as Lizards. The Ostrich is the onely foule which hath haire on the vpper eie-lidde. The Ape hath on them both as well as man. Moreover, all fouls haue not eie-lids, and therefore such do not winke, namely, those that bring forth liuing creatures. The greater and heauier foules, when they would close their eies doe it with drawing vp the nether lid. The same also twinkle by means of a pellicle or skin coming from the corners of their eies. Doves and such like birds wink with both eie-lids: but four-footed beasts that lay eggs, as Tortoises and Crocodiles, vse the nether lid only, without any twinkling at all, because their eies be very hard. The vtmost compasse or edge of haire in the vpper lid, the Latines called in old time *Cilium*, and thereof came the name of the brows, to be *Super-cilium* in Latine. This brim of the eie-lid, if it be diuided by any wound, cannot be drawne together againe: like as some few parts besides of mans body.

Vnder the eies, are the balls of the Cheeks, which men and women only haue; which in old time they called *Genae* in Latine. And by the law of the twelue Tables, women were expressly forbid not to reare, rent, or scratch them in any case with their nails. This is the feat of bashfulness and modesty: heare appeareth most of all the rednesse of blushing. Vnder them, are the hollow pits of the cheekes, wherein mirth and laughter do lodge and inhabite.

Man only hath his Nose standing forth aloft, which now adays they dedicate to flie scoffing and derision, inso much as they attribute that terme do dry mockers and flowters. And verily there is not a creature besides, that hath his nostrils so bearing out. [As for birds, serpents, and fishes they haue holes only to smel at, without any other nostrils to be seen:] & hereof come the surnames of *Simones* and *Silones*, whereof the former haue flat noses, the other are hooked and camoise nosed vpward. Infants haue bin known many times when they are seuen moneths old, to want the holes and passages both of nose and eares.

Then follow the Lips: some men there be that put them far out, by reason that they are gag-rooted or tut-mouthed, and those are called *Brocci*. Others againe who are blabber-lipped, are named in Latine *Labeones*.

As for the mouth, all creatures haue it that bring forth their yong aliue: and either it is gentle and pliable, or else hard and vnruely, as we see horses; that either willingly receiue, or else refuse the bit. By which also we giue to men, the tearme either of modest and good countenance, or else of shamelesse and vntoward. But in stead of mouth and lips both, Nature hath giuen to all foules sharpe Bills of an horny substance, and as many of them as liue vpon rauin and prey, haue them hooked inward: but such as gather and pecke onely, they haue strait beakes. As for those that either graze, roor, or pudder in mud, like to swine, they are broad and flat billed. As for horses, mules, and such like, they vse their mouthes in stead of hands, to gather in their food as they either feed in pasture, or be at racke and manger. And the wider mouthes haue they that liue of killing and denouring other beasts.

No

A No creatures liuing, but man and woman, haue Chins and Iaws. The riuer Crocodile alone moueth the vpper iaw: the land Crocodiles chew as other creatures do, but only bias.

Of Teeth, there be three sorts: for either they be framed like saws, or els set flat, euen, and leuell: or last of all, stand gabbing out of the mouth. The saw teeth run one betweene another, as if two combs grew together, because they should not weare if they met one with another, as we see in serpents, fishes, and dogs. Horses & men haue their teeth of one euen leuell. The bore, the water horse, and the Elephants, haue their tusks and fangs sticking forth. Of those teeth which are smooth and meet just one against another, such as diuide and cut the meat, be broad edged, as the fore-teeth: those that grind and chew, be double, and stand within the chaw: but such as seuer and part the meat in the mouth, be sharp pointed: and we call them our eie-teeth; the Latines *Caninos*, or Dog-teeth. And these are they, that of saw teeth be the longest. Euen and leuel-ranged teeth, be either in both chaws alike, as in an horse; or els they be wanting before in the vpper chaw, as in Kine, Bulls, Oxen, Sheep, & all such as chew cud. Goats haue none aboue but the 2 foreteeth. None haue gabbed tusks standing forth of the mouth, whose teeth are fashioned like a saw. The females of them that haue those fangs & tusks, if haply they haue the like (for seldome they are seen with such) make no offense vfe of them at all: for whereas the Bores do strikewith them, the Sows only do but bite. No horned beasts hath such tuskes: But all those haue hollow teeth, whereas in all the rest, they be found & solid. All fishes be toothed like saws, saue only the guilt-head Scarus; for this only of all creatures liuing within the water, hath an euen course of teeth. Furthermore, many fishes be found to haue their mouth, yea and their tongue, couered and beset all ouer with teeth: to the end, that by the means of many wounds (as it were) they might make soft their meat, which otherwise they could not possibly chew and teare. In many the teeth stand in the pallat and roofof their mouth, yea and in their very taile. Moreover, some there be that haue them crooking inwardly to the mouth, that the meat might not fall out againe: as hauing no other means to hold it in. Also, the Aspides, and Serpents are likewise toothed, but they haue aboue, both on the right side & the left, two teeth that be very long, and those are hollowed within after the maner of smal pipes, like to the stings of Scorpions, by which they discharge their phison. The best writers who haue searched most curiously into the secrets of Nature, do hold, That the venome of Serpents is nought els but their gal; and that by certain veins vnder their ridge bone, the same passeth along to the mouth.

D Some say, that a Serpent hath but one venomous tooth; which because it is crooked, therefore he turneth and bendeth it vpright when he would sting or bite withall. Others affirme, that at such a time the same falls out, and a new cometh vp againe and groweth in the place: for easie it is to be driuen or shaken out: and we see some of them handled and carried in mens bosomes, without that tooth. It is said moreover, that the Scorpions haue the like tooth in their taile, and most of them three together. Vipers teeth are couered and lie hidden within their gums. This Serpent being full of poison, redoubleth her pricke, and at euery bit letteth in poison into the wound. No flying foule hath teeth, saue only the Bat or winged-mouse. Of all creatures which beare no hornes, the Camell onely hath no fore-teeth in the vpper chaw. Such as be horned, haue no saw-teeth. Snailles likewise haue teeth: witnesse the leaues and tendrils of vines, which the very least of them all do gnaw and eat away. But for sea-fishes, that those which liue in shells or be gristly, should haue their foreteeth, and namely, that the sea-Vrchins, a piece; I cannot but wonder how men could come by the knowledge. Insects in stead of teeth, haue a sharp pricke to sting withal. Apes haue teeth euen as men. An Elephant hath foure teeth within to chew with (besides those that stand out) which in the males turne and bend vpward, but in the female they are streight, & shur directly downward. The fish also called *Musculus Marinus*, which goeth before the Whale or Whirlpoole as his guid, hath no teeth at all; but in stead thereof, his mouth all within, his tongue also and pallat, is rough againe with certaine bristles. The lesse four-footed land-beasts, haue the two fore teeth of either side, longer than the rest. As for all other creatures, they bring their teeth with them into the world: man only is born without them, and at the 7 month they commonly breed. In all other creatures they continue still and stick fast; except Men, Lions, Horses, Mules, Asses, Dogs, and such as chew cud, for these change their teeth: but Lions and dogs cast only the eie-teeth, called *Canini* in Latine. The eie-tooth of a Wolfe (so it grow on the right side of the head) is thought to doe strange matters. The great grinders which stand beyond the Eye-teeth, in no creature whatsoeuer doe fall

Gg

out

The Chin & Iaw.
The Teeth.

out of themselves. As for the farthest cheek-teeth in a mans head, which be called *Genuini*, [the Wit-teeth] they come about the time that he is 20 yeares old, and in many at 80 yeares of age. Sure it is, that those teeth fall from women in their old age, and soone after come againe: such women I meane, as had no children in their youth. And *Mutianus* hath reported, That hee saw one *Zandel* a citizen of Samothrace, who had new teeth comming vp after he was an 104 yeares old. Moreouer, males ordinarily haue more teeth than the females: as we may see in mankind, Sheep, goats, and Swine. *Timarchus* the son of *Nicoles* the Paphian, had a double course of teeth in either jaw. He had a brother also who neuer cast his foreteeth, and therefore hee wore them before to the very stumps. We reade in Chronicles of one man that had a tooth growing out of the very pallat of his mouth. As for the eye-teeth, if they be lost by any mischance, there neuer grow again any other for them. In horses only, of all other creatures, teeth wax whiter by age: for in the rest, they turne to be browne and reddish. The age of Horses, Asses, and Mules, is knowne by a marke in the teeth: a horse hath in all 40. At the end of 30 moneths, hee loseth his fore teeth of either chaw, as well aboue, as beneath: the yere following as many, euen those that be next, namely at what time as they put out those which be called the cheek teeth. At the beginning of the fifth yere, he loseth other two, but there come vp new in the place in the sixth yere. By the seuenth yere he hath all, as well those that should come in others place, as those which are firme and neuer change. A gelding neuer casts his teeth, no nor his sucking teeth, in case he were gelded before. Asses in like manner begin to shed their teeth at the 30 moneth of their age; and so forward from 6 moneths to 6 moneths: and if they sole not before they haue shed their last teeth; they are for certaine to be holden barren. Kine and Oxen, when they be two yeres old, do change their teeth. Hogs or Swine neuer haue any teeth to fall. Now when as these marks are gon out, which shew the Age of Horses, Asses, and such like, yee must (to know their age) go by the ouergrowth & standing out of the teeth, the greiness of the haire ouer their brows, and the hollow pits thereabout: for then are they supposed to be 16 yeares of age. As touching men, some are thought to haue venome and poison in their teeth: in so much, as they be shewed bare and naked against a cleare mirror or looking glasse, they wil dimme the beauty thereof, yea, and kill yong pigeons whiles they be calow and vnplumed. But forasmuch as we haue spoken sufficiently of teeth, in our treatise as touching the generation of Man, wee will passe ouer the rest, and proceed vnto other parts, saue onely that this is to be obserued and noted, How children be sicke when they be about breeding of their teeth. And to conclude, of all other creatures, those are most dangerous with their Teeth, which haue them framed like sawes, and closing one betwene another.

The Tongue.

Now as concerning Tongues, we obserue much diuersitie in them: for all creatures are not tongued alike. First and formost, Serpents haue very thin tongues, and the same three-forked; blacke of colour, itching, and ready to pierce; and if a man take them forth, very long. Lizards haue tongues two-forked and full of haire: so haue the Seales or Sea calues a double tongue: but the tongues of these before named, are as small as haire: as for the rest, their tongues serue them to lick their muzzles and lips all about. Fishes haue their tongues for the greater part therof, cleaving fast to their pallat; and in Crocodiles they are so, cleane throughout. But as well fishes as other creatures of the water, haue a fleshy palat, which serues them in stead of a tongue to tast withall. Lions, Libards, and all of that sort, yea and Cats, haue their tongues rough and vneuen, made like a file with many small edges lapping one ouer another: in such sort, as that with licking it wil weare the skin of a man so thin, that their spittle and moisture when it cometh neare vnto the bloud and the quick, will driue oftentimes into rage and madnesse, those whom they so lick, yea although otherwise they be made tame and gentle to come to hand. As touching the tongues of Purple fishes we haue written already. Frogs haue their tongues in the forepart fast to the mouth: the hinder part within toward their throat, is free and at liberty, whereby they keep that croaking which we heare at one season of the yere; namely, when the males cal to the femals for to ingender; & then they be called *Olalygones*: for at that time they let down their nether lip somewhat vnder the water, that they gargle with their tongue leuell to the water, which they receiued into their throat: and so while their tongue quauereth withall they make that croaking noise abovesaid: he that would looke then aduisedly vpon them, should see their specks so swoln and stretched out full, that they will shine againe: he should perceiue, their eyes ardent and ferie with paines that they take thus with the water. Those creatures that haue

A haue pricks and stings in their hin-parts, are furnished also with tongue and teeth. As for Bees, their tongue is very long, and the Grasshoppers put it forth a good way. They that haue a fistulous sting or pricke in their mouth, are provided neither of teeth nor tongue. In some Insects, (as namely Pismires) the tongue lieth close within. Elephants, aboue all other beasts, haue a large and broad tongue. All creatures haue their tongue loose and at liberty at all times, each one in their kind: man only is oftentimes so tongue-tied, that needfull it is to cut certain strings and veines for to ease it. *Metellus* the high priest and chiefe sacrificer at Rome, had such a swelling and flaming tongue (by report) that against he should dedicate the temple of the goddess *Opifera*, he labored so with his tongue for vtterance, for certaine moneths together, & took such pains, as if he had bin vpon the racke. All children, by that time that they be seuen yeres old at the farthest, speake readily, so as they be not by some vnnatural cause impeached. But some men there be, which haue their tongues so at commandement, and so artificially they can handle it and their throat together, that they are able to counterfeit the singing of all birds, and the voice of any other creature, that one cannot know and discern them afunder. As touching Taste, which is the iudgement of meats and drinks, to wit, What smack and tallage they haue: all other liuing creatures find it at the tip of their tongue only: but man tasteth as well with the pallat or rooffe of his month. The spongy kernels, which in men be called *Tonsils*, of the Almonds, are in swine named the Glandules. That which betwene them hangs down from the inmost part and rooffe of the mouth, by the name of the *Vvula*, is to be found in man onely.

Vnder it, there is a little tongue (which the Greekes call *Epiglottis*) at the root of the oesophagus. The flap Epiglottis. C and the same is not to be found in any creature that layeth eggs. A twofold vse it hath, lying as it doth between the two pipes. Whereof, that which beareth more outward, and is called The rough Arterie, or the Windpipe, reacheth vnto the lungs and heart. And as a man doth eat and swallow downe his meat, this foresaid little flap doth couer it, for feare lest as the spirite, breathing and voice passeth that way, the meat or drink (if it should go wrong to the other conduit or passage) might indanger a man and put him to great trouble. The other is more inward, called properly the Gullet, or the Wezand, by which we swallow down both meat and drink, and it is open to the stomacke first, and so to the belly. This also the said flap doth couer by turns, to wit, as a man doth either speake or draw his breath, lest that which is already passed into the stomacke, should come vp againe, or be cast vp vnseasonably, and thereby impeach a man in his speech: the D Windpipe consisteth of a gristly and fleshy tunicle: the Wezand of a membranous or sinewie substance and flesh together.

There is no creature hauing a necke indeed, but it hath also both these pipes. Wel may they haue a gorge or throat, in whom there is found but the gullet only: but nape of neck behind they can haue none. As for those vpon whom Nature hath bestowed a neck, they may with ease turn their head about too and fro euery way, to looke about them, because it is composed of many spondyles, or turning round bones, tied and fastened one vnto another by ioints and knots. The Lion only, together with the Wolfe, and the Hyæna, haue this necke bone of one entire and straight peece, and therefore stiffe that it cannot turne. Otherwise it is annexed to the chine, and the chine to the loines.

E This Chine likewise is a bony substance, but made round and long, and fistulous within, to giue passage to the marrow of the backe, which descendeth from the brain. Learned men are of this opinion, That this marrow is of the same nature that the braine is: and they ground vpon this experience, That if the thin and tender skin that incloseth it be cut through, a man cannot possibly liue, but dieth immediatly. All creatures that be long legged, haue likewise in proportion as long necks. So haue also water-fowls, although their legs be but short. But contrariwise, yee shall not see any birds with long necks, that haue hooked tallons. Men onely and Swine, are troubled with the swelling bunch in their throats: which many times is occasioned by corrupt water that they drinke. The vpper part or top of the Wezand, is called the Gorge, or the gullet: the nether part or the extremitie thereof, is the Stomacke. There is another fleshy concauitie of this name, vnder the windpipe, annexed to the chine-bone: long it is and wide, made in fashion of a bottle, flagon, or rather a gourd. Those that haue no gullet, are also without a stomack, a necke, and a wezand, as fishes: for their mouths and bellies meet. The sea Tortoise hath neither tongue nor teeth: with the edge of his muffle (so sharpe it is) he is able well enough to chew all his viuals.

G g 2

Vnder

The Stomack

Vnder the Atterie or wind-pipe, is the mouth of the stomacke, of a callous or gristly substance, thicke toothed, with prickles in manner of a bramble, for the better dispatching of the meat, and these orches or plaits grow smaller and smaller, as they approach neerer to the belly: so as the vtmost roughnesse thereof in the end is like vnto a Smiths file.

The Heart.

Now are we come to the Heart, which in all other liuing creatures is scituate in the very midst of the breast in man only it lies beneath the left pap, made in maner of a pearce, & with the pointed and smaller end beareth out forward. Fishes alone haue it lying with the point vprward, to the mouth. It is generally receiued and held, that it is the first principall part which is formed in the mothers wombe next vnto it the braine, and the eies last of all. And as these be the first that die, so the Heart is last. In it (no doubt) is the most plenty of heat, which is the cause of life. Surely it neuer moueth and panteth, like as it were another liuing creature by it selfe: covered it is within forth with a very soft, yet a strong tunicle, that enwrappeth it: defended it is besides with a strong murd of ribs, and the breast bone together: as being it selfe the principall fortress and castle, which giues life to all the rest. It contains within it certaine ventricles and hollow receiues, as the chiefe lodgings of the life, and bloud, which is the treasure of life. These in greater beasts are 3 in number: & none there is without two. This is the very seat of the mind and soule. From this fountain there do issue 2 great vessels, master-veins or arteries, which are diuided into branches: & being spread as wel to the fore-part as the back parts of the body, into smaller veins, do minister vitall bloud to all the members of the body. This is the only principall part of the body that cannot abide to be sick, or languish with any infirmity: this lingereth not in continuall pain: no sooner is it offended, but death insueth presently. When all other parts are corrupt and dead, the Heart alone continueth aliue. All liuing creatures that haue an hard & stiff heart are supposed to be brutish: those that haue small Hearts, be taken for hardy and valiant: contrariwise they are reputed for timorous and fearfull, which haue great Hearts.

And the bigger Heart, in proportion of the body, haue Mice, Hares, Asles, Deere, Panthers, Wicels, Hyenas, & in one word, all creatures either by nature fearefull, or vpon feare hurtfull. In Raphlagonia, Partridge haue two Hearts. In the Hearts of Horses, Kine, Bulls and Oxen, are other while bones found. The Heart in a man groweth yerely two drams in weight, vntill it be 50 yeares of age, and from that time forward it decreaseth from yere to yere as much: whereupon he is not able to liue above 100 yeares, for want of Heart: as the Egyptians be of opinion; whole manner is to preserue the dead bodies of men spiced and embalmed. It is reported of some men, that they haue hearts all hairy: and those are held to be exceeding strong and valiant.

* In three kind dry battels.

Such was Aristomenes the Messenian, who slew with his owne hands * 300 Lacedæmonians. Himselfe being sore wounded and taken prisoner, saued his owne life once, and made an escape out of the caue of a stone quarrie, where he was kept as in a prison: for hee got forth by narrow Fox-holes vnder the ground. Being caught a second time, while his keepers were fast asleep, he rolled himselfe to the fire, bound as he was, and so without regard of his owne bodie, burnt in funder the bonds wherewith he was tied. And at the third taking, the Lacedæmonians gaused his brest to be cut and opened, because they would see what kind of Heart hee had: and there they found it all ouergrown with hair. Moreouer, this is obserued in perusing the inwards of beasts, That when they be wel liking, and do presage good, the Heart hath a kind of fat in the vtmost tip thereof: howbeit, this would be noted, That according to the Soothsaiers learning, their Heart is not alwaies taken for a part of the bowels or intrails: for after the 123 Olympias when Pyrrhus king of Epyrus was departed out of Italy, what time as L. Posthumus Albinus was king sacrificer at Rome, the Soothsaiers and Wisards began first to look into the heart, among other inwards. That very day when as Cesar Dictator went first abroad in his roiall purple robe, and tooke his seat in the golden chaire of estate, he killed two beasts for sacrifice, & in both of them the intrails were found without any Heart: whereupon arose a great question and controuersie among the Augures and Soothsaiers, How it could be, that any beast ordained for sacrifice should liue without that principall part of life: or whether possibly it might lose it for that present only: Ouer and besides, it is held for certaine, that if any dye of the trembling and ache of the heart, or otherwise of poison, their heart will not burne in the fire. And verily, an Oration there is extant of Vitellius, wherein he challengeth Piso, and chargeth him directly with Poysoning of Germanicus Cesar, vpon this presumption, for he openly protested and proued, That the heart of Germanicus would not consume in the funerall fire, by reason of poyson. But contrariwise,

A riwife, Piso alledged in his own defence the foresaid disease of the Heart called Cardiaca, whereof as he said Germanicus died.

Vnder the Heart lie the Lights, which is the very seat of breathing: whereby we draw and deliuer our wind. For which purpose, spongyous it is and full of hollow pipes within. Few fishes, as we said before, haue any Lungs: other creatures also that lay eggs, haue but final, and the same full of froth, and without bloud: wherupon they be not thirsty at all: which is the cause likewise that Seales and Frogs can diue so long vnder the water. The Tortoise also, albeit he haue very large Lungs, and the same vnder his shell, yet there is no bloud therein. And verily, the lesser that the lungs be, the swifter is the body that hath them. The Chamaeleons lights be very big, for the proportion of his body, for little or nothing els hath he within it.

The Lights or Lungs.

Next followeth the liuer, which lies on the right side. In that which is called the head of the Liuer, much varietie and difference there is. For a little before the death of Marcellus (who was slaine by Annibal) as he sacrificed, there was found a Liuer in the beast, without that head or fibres aforesaid: and the next day after, when he killed another for sacrifice, it was seen with two. When C. Marius sacrificed at Vtica, the same was likewise wanting in the beast, being opened. Semblably, when prince C. Caligula the Emperor sacrificed vpon the first day of Ianuarie, at his entrance into the Consulship, the Liuer head was missing but see what followed! in that yere his hap was to be slaine. Moreouer, his successor Claudius within a month before he died by poison, met with the like accident in his sacrifice. But Augustus Cesar, late Emperor of famous memory, as he killed beasts for sacrifice, the very first day that he entred vpon his imperiall dignity, found in 6 of them 6 liuers, which were all redoubled & folded inward, from the nethermost lobe or skirt beneath: wherupon answer was made by the Soothsayers, That within one yere he should double his power and authority. The foresaid head of the Liuer, if it chance to be slit or cut, presageth some euill hap, vnlesse it be in case of feare and pensiuenesse: for then it betokeneth good issue, and an end of care and sorrow. About the mountaine Briletum and Tharne, also in Chersonesus neere vnto Propontis, all the Hares ordinarily haue two Liuers: and (a wonderous thing it is to tell) if they be brought into other countries, one of the said Liuers they loofe.

The Liuer.

Fast to the Liuer hangeth the Gall; yet all creatures haue it not. And about Chalcis in Euboea, the sheep are quite without Gall. But in Naxos they all haue two Gals, and the same very big. The strangers that come into both those parts, think the one as prodigious & monstrous as the other. Horses, Mules, Asles, Deere both red and fallow, Roe-bucks, Swine, Cammels, and Dolphins haue no Gall. Some Mice and Rats there be which haue it. And few men there are without, howbeit, such are of a stronger constitution, more healthfull, & longer liued. Howbeit some are of opinion, That all horses haue Gall, not annexed to their liuer, but within their bellie: and as for the Deere aforesaid, it lieth (as they think) either in their taile, or els their guts: which (by their saying) are so bitter, that hounds and dogs by their good wils would not touch them. Now this Gal is nothing els but an excrement purged from the worst bloud: & therefore bloud is taken to be the matter thereof. Certain this is, that no creatures haue Liuers, but such as likewise haue bloud. And in truth, the Liuer receiueth bloud from the heart, vnto which it is adioined, and so conueigheth and distributeth it into the veins. Black choler lying in the Liuer causeth fury and madnesse in man: but if it be all cast vp by vomit, it is present death: hereupon it commeth, that we terme furious and raging persons by the name of cholericke, or full of Gall: so great is the venome of this one part, if it reach once to the seat of the mind, and possesse it. Nay more than that, if it be spread and dispersed ouer all parts of the body, it infecteth it with the yellow jaundice, yea, and coloureth the very eies, as it werewith Saffron. Let it out of the bladder or bag wherin it is, ye shall see it stain vessels of brasse, yea, they wil become black againe, and lose their brightnesse if they be touched therewith. No maruell then if the venome and poison of serpents, proceed from the Gall. They that vse to feed of worme wood growing in Pontus, commonly haue no gall. Rauens, Quails, and Feafants, haue their gall ioining to their kidneys, or rather to their guts, of one side and no more: and some to the guts only, as Pigeons, Hawkes, and Lampreies. Few birds there be that haue gall in the Liuer. As for Serpents and Fishes, they haue the greatest gals of all others, for the proportion of their bodies. Most of them haue their gall along their guts throughout, in manner of the Hauke and the Kite. Moreouer, in all Whale fishes their gall is fastened to the liuer: and so, we see it lieth in the Seales, whose

The Gall.

whose Gall is singular good for many purposes. Oxe Gall in limning giueth a golden colour: G
The Soothsaiers haue dedicated it to *Nephtis*, & the mighty power of water. *Augustus* the Emperor found two Galls in a beaft that he killed for sacrifice, vpon that very day whereon he obtained that famous victorie at Actium. Some say, that the lobes or fibres in the smal Liuers of certaine Mice and Rats, are commonly found to be as many as the Moone is daies old in euery moneth: and looke how many daies you reckon of her light, so many may you count the fibres aforefaid. Also, that their liuer groweth at mid-winter, when daies be at shortest. In the kingdoms of Grenada and Andalusia in Spaine, Conies are many times found with double Liuers. The land Frogs of Toads kind, haue one lop or lappet of the liuer, which Ants will not touch, because of the poison therein, as is supposed. Liuer of all things may be kept and preferred longest: and we reade in chronicles, that there haue bin found in some cities long besieged, Liuers in salt or powder, which had continued a 100 yerres. Serpents and Lizards haue long Liuers. In that sacrifice which *Casina Volaterranus* killed, Dragons were seen to issue from among the Entrails and the Liuer; and this turned to be a lucky presage. And verily, why should wee think this report or any other in sacrifices, to be incredible? considering that vpon the very day that *K. Pyrrhus* was slain, the heads of the beafts being slain for sacrifice (notwithstanding they were cut off from the bodies) moued forward vpon the ground, and licked vp their owne blood.

The Midriffe The vpmost inwards of a man, to wit, the Heart and Lungs, are diuided from the other entrails beneath, by certain pellicles or rims of the Midriffe, which the Latines call *Præcordia*, (because they are drawne and set before the Heart as a defence:) and the Greeks *Phrenes*: true it is, that Nature in great prouidence hath inclosed all the noble and principal parts within several skins and coats of their owne, which might serue in stead of sheathes and cases for their better defence: but in this partition of the Midriffe, shee had a more particular regard to the propinquitie of the Stomack and Belly, lest that the vitall parts being so neare, should be oppressed and suffocated with the streams and vapors of the meat therein boiling. To this parr are we beholden for our quick wit, this membrane of the Midriffe we may thank for our ready conceit and vnderstanding: to which effect, charged it is with no flesh, but composed of fine & subtil sinews. The same likewise is the very especiall seat of mirth: as we may perceiue euidently by tickling vnder our armpoles, vnto which it reacheth: and as in no place of mans body the skin is more fine and tender, so it taketh as great pleasure to be tickled and lightly scratched there. And herupon it is, that in solemne combats of sword-fencers at vtterance with the sharp, as also in field battels, we haue many a time seen men wounded and thrust through the Midriffe, to die laughing.

The Bellie or Pannch, with the Guts. *Aristotle* saith foure fold. To proceed in our Anatomy, all creatures hauing a Stomack or Read, are not without a belly vnder it. As many as chew cud, haue the same * double or two fold, the rest one and no more: and looke who want blood, are without it also. For some there be that haue one entire gut, that beginneth at the mouth, and by a certaine way redoubleth and returneth backe againe thither, and namely, the Cuttill and the Polype. In man it is annexed to the bottome of the Stomack, like as in a Dog. And in these twaine onely, narrower it is in the lower part: which is the cause that none but they do vomit; for when their bellies be full, the streight passage beneath keeps the meat from descending, and so it returneth vward: which cannot happen to them that haue it wide and large, whereby the meat is sooner sent downe into the guts beneath. Next to the bag of the Stomack, men and sheep haue the small guts called *Lactes*, through which the meat passeth: in others it is named *Ile*. Next vnto which are the greater guts, that reach into the Paunch: and in man they are full of windings and turnings: which is the reason, that as many as haue a great space between the Stomacke and the Paunch, are more hungry and greedy of meat than others. And those who haue the fattest and most greasest bellies, most commonly are the grossest of capacity and vnderstanding. Some fouls likewise haue a two-fold receptacle for their meat: the one is the gizzer, craw, or gorge, wherein they bestow at the first their meat when they take it new: the other is the true stomacke indeed; into which they send out of the former, the victuals already altered, prepared, and in good forwardnes of concoction. And such be Hens and Pullet, Coists or Stock-doues, House-doues, or Pigeons, and Partridges. All the rest in manner want the said gizzer, but in stead thereof haue a wider gorge, where-through the meat passeth into the stomack, as *Choughes*, *Raucens*, and *Crowes*. Some againe there be that haue

A haue neither one nor other, but be far different from the rest, and these haue their bellie hard to their gorge: and especially such as haue long neckes and narrow, as the bird *Porphyrus*. The paunch or bellie of those beafts which are whole hounded, is hard and rough. And in land beafts, it is in some thicke toothed, and set full of sharp prickles: in others it is framed rugged likewise, plaited crosse in manner of lattice, readie to catch and bite what focuer. Those which haue not teeth in both chawes, nor yet chew cud, do in this bellie concoct and digest their victuals, and out of it they send the meat into the paunch where the guts lie. This member, in the mids, is in all creatures fastened to the nauill: and in man it is like vnto that of a swine, hauing toward the neather part, a great gut named Colon: and this is it, which giues occasion to the intollerable paine of the colique. This Gut in dogs, is very streight and narrow, whereupon they haue much adoe to discharge it, and lightly they doe not skummer, but with great paine and difficultie. B Those creatures of all others be counted most vnstatable, whose meat passeth immediatly out of their bellie into the straight gut Longaon, or the Tiwill: as among foure-footed beafts, the Wolfe, engendred betwene the Hind and a hee-Wolfe: and in foules, the Cormorant. An Elephant hath foure bellies or paunches: all other parts within, be answerable to those in Swine. Their lungs be foure times as big as those in an Oxe. The gorge or craw, and the stomacke or gizzer in birds, is the thicke and fleshie. In the maw or stomack of Swallows young birds, there be some certaine little white stones, or else of a reddish colour, called therupon *Chelidonij*: and they be in great request in Art-Magicke, namely for charmes and enchantments. Likewise in the second bellie or paunch of yong Heifers, there is found a small, black, and grauelly stone round as a bal, and light withall: a singular remedie (as it is thought) for women that haue hard labour and be deliuered with much paine & difficultie, so it be taken before that euer it touch the ground. C The Stomacke and the Guts, are kept within a fat and thin cawle, in all creatures but those that lay eggs.

The Cawle or Kell.

Vnto this Cawle, is fastened the Spleene on the left side of the belly just against the liuer. D And otherwhiles these two shift their places, and one lies where the other should; but that is euer held as a prodigious token. Some are of opinion, that those creatures which lay eggs haue a Splene, but it is very smal: as also the Serpents. And surely such an one appeares plainly in the Tortoise, Crocodile, Lizards, and Frogs. Certaine it is, that the bird *Agoccephalus* hath none at all, no more than others that want blood. This member hath a propertie by it self sometimes, to hinder a mans running: whereupon professed runners in the race that be troubled with the spleene, haue a deuise to burne and wast it with an hot yron. And no maruell: for why? they say that the Splene may be taken out of the bodie by way of incision, and yet the creature liue neuer the lesse: but if it be man or woman that is thus cut for the Splene, hee or shee loseth their laughing by the means. For sure it is, that vntemperate laughers haue alwaies great Splenes: In *Scythia* (a countrey of Asia) the sheep haue very small Splenes, and from them were deuised the remedies to cure the disease thereof, and to wast their excessiue greatnesse.

The Spleene.

E But about Briletum and Tharne (the hills abouenamed) the Deer haue foure Kidnies apeece: whereas on the contrarie side, neither feathered fowle nor skalie fish, haue any. Moreover, the Kidnies sticke close vnto the bones. The right Kidney in all creatures is the bigger, lesse fat, dryer of the twaine: howbeit in both of them, there is a fat issueti out of the mids, faue only in Seales. All liuing creatures are fattest about the raines of the backe: and sheepe may be so far ouergrowne with fat, that they will die thereof. Sometime there be little stones found within them. All four-footed beafts that bring forth their yong quick, haue kidnies. And of such as lay eggs, the Tortoise alone, which also hath all other entrails. The Kidnies of a man, be like to those of Kine and Oxen, as if they were composed of many together.

Kidnies.

F Nature hath imbarred the Breast-parr (wherin lie the vitall members) with ribs round about: but toward the belly (which needs must grow and stretch) shee hath not so done, but hath giuen it libertie: for no liuing creature hath bones to compasse the panch. Mans Breast only is broad and square: in all others it is framed otherwise, like the keele of a ship: which is more euidently to be seene in birds and in water-fowles most of all others. As for Ribs, man only hath eight that be full and whole: Swine haue ten: horned beafts thirtene: Serpents thirtie.

Brest & ribs.

Vnder the belly and paunch in the fore-part of the bodie, hangeth the bladder: which no creature laying eggs hath, save only the Tortoise. It is found in none but such as haue a paire of lungs, and the same with blood: neither in any creeping creature without feet. Betwene it and the

The Bladder.

the belly be certaine canals or arteries, reaching to the groine, which by the Greeks are named *Gilia* [i. the Flanks.] In the bladder of a Wolfe, is found a little stone called *Syrites*. But in some mens bladders, ye shall see otherwhiles certaine grosse haire to engender, like to bristles; also grauell and stones, which put them to intollerable paine. This bladder consisteth of a certaine tunicle or skin, which if it be once wounded, cannot again be consolidated; no more than those fine pellicles or rinds that enwrap the braine and the heart. For you must thinke, that there be many sorts of these membranes or filmes seruing to sundrie vses.

The Matrix

As for women, their inward parts are answerable to mens in all these respects abouesaid: and besides, they haue by themselves adioyning close vnto the bladder, another little bag or purse; whereupon it is called in Latine *Uterus*: and it hath another name beside, to wit, *Loco*; which we call the Matrix, the Mother, or the Wombe: and in other creatures it is tearmed *Vulua*. In Vipers, and such as hatch their eggs within them it is double. In those that lay eggs, it lyeth fast to the Midriffe. In women, it hath of either side two chombers or concauities. If at any time it chance to be peruerted and turned the wrong way, or take aire into it, it is deadly, and riseth vp to stop the wind. If Kine be with Calfe, men say, they carrie not their yong but in the right cell or receptacle thereof, yea, although they goe with two Calues at once. Our fine-toothed giutons do find a better tast in a Sows wombe that slips and casts her Pigs and it together, or is cut out of her belly, than if the dam bringeth forth her fruit at full time. The one forsooth is called *Ejecticia*, the other, *Porcaria*. And the best is that of a yong Sow that neuer farrowed before: and contrariwise, of old Sows and such as haue giuen ouer to farrow. After she hath pigged, vnlesse she be killed the same day, the same hath a dead color, and is but leane. And yet that of a young Swine is not greatly commended, vnlesse it be of her first Pigs. Howbeit, those of old Sows also be in request, so they haue not giuen ouer breeding: and namely, if they be taken either within two daies before they should pig, or within two daies after they haue pigged, or at leastwise, the very same day. The next to the cast-wombe abouesaid, is that of a Sow killed a day after she hath pigged. The paps and teats of such a Sow, newly hauing farrowed, is counted excellent good meat, so that it be taken before euer the Pigs sucked them drie: but those of a Sow which hath cast her pigs before time, is held for the worst of all. In old time they called this morcell in Latine *Abdomen*, and before it was growne hard and brawnie, they neuer were wont willingly and wittingly to kil Sows, * euen vpon the point of their farrowing, and being readie to Pig [as our monstrous gluttons doe now adaies, because they would haue the teats soft, tender, and full of milke.]

Ancientes

Tallow and greafe.

All horned beasts hauing teeth growing but in one jaw, and pasterne bones about their feet, do beare tallow or sewer, and feed fat. Those that be clouen-footed, or otherwise haue feet deuided into many toes, and beare no horns, haue no tallow, but greafe or fat. The tallow or sewer growes to be hard, and when it is thoroughly cold, is brittle and apt to crumble and breake; and is euer found in the edge and extremities of the flesh: contrariwise, the seam or greafe is entered larded betweene the flesh and the skin; liquid it is, and easie to melt. Some creatures there bee that will neuer be fat, as the Hare and Partridge. Generally, whatsoeuer is barren, be it male or female, will soone feed fat. Sooner grow they to be old which are ouer-fat. No liuing creatures there are but haue a certain fat in their eies: & the tallow in any thing whatsoeuer, is senslesse: for neither hath it Arteries nor Veines. The fat also & greafe in most of them, is without fence. And hereupon it is, That some affirme, how Mice and Rats haue gnawne and eaten fat Hogs whiles they were aliue, and made them nests in their backs: yea, and *Lucius Apionius* sometimes Consul, had a sonne so fat that he could not goe, so heauiue was he laden with greafe; in so much, as he was faine to take some of his greafe forth of the bodie, and so discharge himselfe and become lighter.

Marrow.

Marrow seemeth to be much of the same natre: in youth it is red, and in age waxeth white. This is neuer found but in hollow bones: and yet not in the legs of Horse, Ass, Mule, or Dog. And therefore if they chance to be broken, they will not fowder and vnite againe, which happens when the Marrow runs out to the place of the fracture. In those that carrie greafe or sewer, fattie it is and greafe: but in horned beasts it resembles Tallow. Sinewie it is, and that onely in the ridge of the backe of as many as haue no bones, as namely, in all fishes. Beares haue none at all. A Lion likewise hath but very little, to wit, in some few bones of his thighes & butts behind, and also of his legs before vnder his shoulders. For his other bones are so hard, that they will strike

G

H

I

K

L

A strike fire, as it were an hard flint. The Marrow is hard in them that gather no greafe, but rather tallow.

The bones of Asses legs are good to found shrill, and to make pipes of. Dolphins haue verie bones, and not prickie chines: for they bring forth their yong aliue. Serpents haue only prickie ridges. Fishes that be soft haue no bones: but their bodie is bound with certaine hoopcs or circles of flesh, as the Cuttill or Calamarie. Neither haue Insects any bones at all. Those fishes which be not soft, but gristly, haue a kind of marrow in their ridge bone. Scales haue gristle, and no bone: The eares and noethrills of all creatures, if they beare vp but a litle, haue a soft tender gristle apt to bend and wind: such is the goodnesse of Nature, providing that they should not breake. A gristle if it be broken, will not close together and be found. Neither will bones, if ought be cut from them, grow againe: vnlesse it be in horses and such beasts of carriage, and namely, betweene the house and the pasternes.

Bones and Gristles.

Growth.

A man Groweth in height and length vntill hee be one and twentie yeares of age: then begins he to spread and burnish in squarenesse. As well men as women-kind, shute vp most and vndoe the knot that hindered their growth, when they are come to fourteene yeares of age, and be vndergrowne: and most is this seene, if some sicknesse happen about that time.

As for the Sinewes, Ligaments, and Cords, which take their beginning at the heart, be couered (as it were) with a certain white and glutinous substance, and the like cause and nature they haue. These in all bodies, are tied to the slipperie bones: the knitting of the bones together, which be called joints, they fasten and bind together, some by comming betweene, others by clasping round about, & others again, by passing crosse ouer: in one place they be twined round, in another broad, according as the figure of each part doth require. Be they cut a two, as they cannot knit againe, so they put a man to no paine: prickie or wound them, a wonder to see, what extremitie of paine will thereupon ensue. Some creatures be without nerues and sinewes, as namely fishes, for they stand much vpon Arteries, and yet ye shall haue neither the one nor the other in soft fishes. Look where there be Sinews, Cords, and Ligaments, those that lie more inward and vnderneath, stretch out the part and giue libertie: whereas the vppermost that lie ouer them, draw the same in as much.

Sinews, Cords, & Ligaments

Among these are hidden the Arteries, that is to say, the passages of the spirit and life. And ouer them ride the Veines, euen the very conduits and channels that carie the blood. The Pulse or beating of Arteries, is most euident in the extremities or ends of any members; and for the most part bewraies hidden diseases. *Herophilus* that renowned Poet and interpreter of Physick, hath with marvellous skill reduced the order thereof into an art: he hath set downe most artificially, the certaine measures and times, the compasse, the metricall lawes thereof, according to euery age: when they strike euen and steadie, when too fast, when too slow. But the skill herof is little exercised, and his inuention in that behalfe neglected: because it seemed ouerwittie, subtile, and curious. Howbeit, the obseruation of the strokes, either comming thick & fast, or slow and softly, giueth a great light to iudge of the strength of Nature, that gouerns our life. Arteries want fence, and no maruell, for they be without blood. Neither do they all containe within them vitall spirit. For there haue bene knowne some of them cut in twaine, and yet that part of the body onely is mortified, which receiued the offence. Birds haue neither Veines nor Arteries. Likewise, Serpents, Tortoises & Lizards, haue but very little blood. The Veines dispersed at the last into most fine and small threadie fibres vnder all the skin, grow at the length to bee so slender that the blood cannot possibly passe thorough them, nor any thing else: saue a thin humor or moisture, which thorough infinite small pores of the skin doth breath forth, and stands there like a dew, and is called Sweat. The place where all the Veines doe meet in a round knot together, is the Nauell.

Veines and Arteries.

CHAP. XXXVIII.

F Of Blood, as well that which soonest waxeth drie, as that which will not thicken at all. Also, which is the grossest blood, and heauiest, which the lightest and thinnest: and last of all, what creatures liuing haue no blood at all.

Those that haue much blood, and the same fat and grosse, are angrie and chollericke. The blood of males is commonly blacker than that of females: yea, and more in youth than in old

old age : and the same in the bottome and lower part, setleth fatter and grosser than above. In blood consists a great portion and treasure of life. When it is let out, it carries with it much vital spirit : howbeit, senselesse it is, and hath no feeling. The strongest creatures be they which haue the thickest blood : but the wisest, those that haue thinnest : the more fearefull, that haue least : but dull and blockish altogether which haue none at all. Bulls blood of all other soonest congealeth and waxeth hard, and therefore poison it is, to be drunke especially. The blood of Bores, red and fallow Deere, Roe-buckles, and all Buffles, will not thicken. Asses blood is most fatty and grosse : and contrarily, mans blood is thinnest & finest. Those beasts which haue more than 4 feet, are bloodlesse. Those that be far haue small store of blood, because it is spent in farnesse. Man only bleeds at the nose : some at one nostrill alone, others at both : and some againe void blood downward by the Hemorrhoids. Many there be that cast vp blood at certaine times, ordinarie, by the mouth : as not long since *Macrinus Viscum*, late pretor of Rome : and vsually euerie yeare *Volusius Saturninus*, Prouost of the citie ; who notwithstanding liued vatill hee was above fourescore and ten yeres old. Blood is the only thing in the body that increaseth presently. For so we see, that beasts killed for sacrifice will bleed most freshly & in greater abundance, if they dranke a little before. Those creatures that lie hidden in the earth at certaine times, (as we haue said before) haue no blood in all that while, vnlesse it be some few, and those very small drops gathered about their hearts. A wonderfull worke of Nature, that it should be so : as also that in a man it should alter and change euer and anon, so as it doth vpon euery small occasion : and the force and strength thereof varie, not only for defect and want of matter to disperse abroad, but also for euery little motion and passion of the minde, as shame, anger, and feare. For one while it sheweth pale, another while red, more or lesse, in much varietie of degrees. In case of anger it wil shew one color : of shame and bashfulnesse appearing in another. In feare, doubtlesse it retires and flies backe, in such sort, as a man knowes not what is become of it : so as many in that fit haue ben stabbed and run thorough, and yet bleed not at all one drop : but this suddaine change of colour happens to men only. For in other creatures, which (as we haue said) do alter their hue, it is an outward colour that they take from the reflection of certain places neer vnto them, man alone hath this change from within himselfe. To conclude, all maladies and death especially, consume the blood.

CHAP. XXXIX.

¶ Whether in Blood resteth the souerainetie or no? Also of the nature of Skin of Haires, and the Paps.

SOME measure not the fineness of spirit and wit by the puritie of blood : but suppose that creatures are brutish, more or lesse, according as their Skin is, thicker or thinner : and as the other couertures of their bodie be either grosse and hard, or thin and tender : as we see for example in Oisters and Tortoises. They affirme moreover, that the thick hide in Kine & Oxen, and the hard bristles in Swine, impeach the entrance of subtil aire and fine spirit into their bodies : in such wise, that nothing can pierce and passe through, which is pure and fine, as it should be. And hereto they bring men also, as a prooffe, who are thicke skinned, and more brawnie, for to be more grosse of sence and vnderstanding : as who would say, that Crocodiles were not very wittie and industrious, & yet their skin is hard enough. And as for the Riuer-horse, his hide is so thicke, that thereof jaulines and speares are turned : and yet so industrious is that beast, that in some case he is his owne Physician, and he hath taught vs to open a veine, and let blood. The Elephants skin is so tough and hard, that thereof be made targuets and shields, of so good prooffe, that is impossible to pierce them thorough, and yet they are thought to be of all four-footed beasts, most ingenious and wittie. Wherefore, conclude we may, that the skin it selfe is senselesse, and hath no fellowshipp at all with the vnderstanding : and especially that of the head, and whersoever it is of it selfe naked and without flesh, be sure (if it be wounded) impossible it is to consolidate the wound, and namely, in the eie lids and bals of the cheekes. All creatures that bring forth their young quicke, are hairie : those that lay eggs, haue either feathers, as birds : skales, as fishes : or else be couered with shels, as Tortoises : or last of all, haue a plaine skin and no more, as Serpents. The quills of all feathers be hollow. Cut them, they will grow no more : plucke them, they will come againe. Insects flie with thin and brittle pellicles or membranes.

The

- A The sea Swallowes haue them euermore moist and drenched in the sea. As for the Bat, he is afraid to wear them, and therefore flies about houses, & his wings besides are diuided into joints. The haires that grow forth of a thick skin, are commonly hard & grosse, but euermore thinner and finer in the females. In horses and mares they grow at length vpon their mains. Lions also haue them long about their shoulders and foreparts. Connies haue long haires about their cheekes, yea, and within-forth : as also in the soles of their feet : and so hath the Hares, according to the opinion of *Trogus* : who thereby collecteth, that hairy men likewise are more lecherous than other. The hairiest creature of all other is the Hare. In mankind only there grows haire about the priuy parts : and whosoever wants it, man or woman, is holden for barren, & not apt for generation. Haires in men and women are not all of one sort : for some they bring with them into the world, others come vp and grow afterwards. Those they haue from their mothers womb do not lightly fall and shed, and least of all in women. Yet shal ye haue some women to shed the haire of the head, by occasion of sicklinesse : as also other women to haue a kinde of down vpon their face, namely when their monethly fleurs do stay vpon them. In some men the later kind of haires, to wit of the beard, &c. wil not come of their own accord without the help of Art. Four-footed beasts shed their haire yerely, and haue it grow againe. Mens haire of their heads groweth most : and next to it that of their beards : if the haire be cut it grows not againe at the cut end, but springs from the root. It growes apace in some sicknesses, and most of all in the consumption of the lungs, and in old age, yea, and vpon the bodies of the dead. In lecherous persons, the haire of their head, browes, and eie-lids, with which they came into the world, do fall more early than in others : but those that spring afterward grow sooner againe if they be cut and shauen. The wooll and haire that foure footed beasts do beare is more course and thick by age, but it comes not in such plenty as before. And such haue alwaies their backe well couered with haire and wooll, but their bellies bare. Of Kine and Ox hides sodden there is made glew : but the Bulls hide hath no fellow for that purpose. Man only of all males hath euident paps in his breasts : other creatures haue little nipples only in shew of teats. Neither hath all females teats in their breasts, but only such as are able to suckle their yong : none that lay eggs haue paps, nor any haue milk vnles they bring forth their yong liuing : and yet of all fowles I must except the Bat alone. As for the illfaured Scritchowles called Stryges, I think they be but tales that go of them : namely, That they will giue milk out of their breasts to yong infants. True it is, all men agree in this, That the manner was in old time to vse in cursing and execration, the termes of Strix ; but what bird it should be I suppose no man as yet knoweth.

CHAP. XL.

¶ Notable obseruations in liuing Creatures as touching their paps.

- SHEE Asses are much pained with the ache of their vdders, when they haue soled ; and therefore after six moneths they will not giue them any more sucke : whereas mares doe suckle their colts a whole yeare almost. Those beasts which be whole hoofed, and haue not about two yong at once, haue all of them two paps and no more, and those in no other place else but between their hinder legs. Such as be clouen footed, and horned likewise, haue them in that place : but Kine haue foure teats ; Ewes & Goats but two apiece. Such beasts as be very fruitful and bring many yong, and likewise whose feet are parted into toes, these haue many nipples or teat heads all along their belly, disposed and set in a double course, as namely Sowes : of which those of the better sort haue 12 ; the common sort but tenne. Also Bitches after the same manner. Some beasts haue 4 teats in the mids of their belly, as Panthers : some twaine and no more, as the Lionesse. The Elephant alone hath twaine vnder his shoulders or legs before, and those not euident in the breast part, but short thereof, and lying hidden as it were within the arm-pits. And generally, none that haue their feet diuided into toes, haue vdders behinde vnder their hin legs. A Sow at euery farrow giues the foremost nipples to those pigs that come first, and so in order as they be farrowed : and those teats be they that are next to her throat and highest. Euery pig knowes the own pap, and will take it and no other when it comes first into the world ; and thereof it is nourished. If a pig be taken from the sow, the milk of that pap wil dry vp presently, or returne backe, and the pap it selfe fall flat to the belly. Also if it chance that but one sucking pig be left, that pap alone wil do the part and let down milke, which Nature

ture first appointed for that one pig. She Beares haue foure paps apiece. Dolphins haue no more but two teats and nipples in the bottom of their belly, and those not very apparant to the eye, nor streit and direct, but lying fomwhat aside and byas: and no beast besides giueth sucke as it runneth but shee. To conclude, Whales, Wirlepooles, and Seales, nourish their yong with their vdder and teats.

CHAP. XLI.

¶ Of Milke: and of what milke Cheefe cannot be made.

THe milke that comes from a woman before she hath gon 7 months with child is not good: but from that time forward it is wholsome, because the infant may liue and do well after that terme. Many are so frim and free of milke, that all their breasts are strut and full thereof euen as far as to their arm-holes. Camels giue milke vntill they be great with yong again: and their milke is thought to be most sweet and pleasant in tast, if to one measure thereof you put three of water. A Cow hath no milke ordinarily before she hath calued. The first milke that she giueth downe is called Beestins: which, vnlesse it be delayed with some water, will soon turn to be as hard as a pumish stone. She Asses are not so soon with yong, but they haue milke in their vdders: but if they go in good and battle pasture, it is not good their yong shoud suck their milke in two daies after, for the very tast thereof is enough to kil them: and this disease that comes of Beestins is called Colostratio. The milke that those giue which haue teeth in both chawes is not good to make cheefe of, because it will not cruddle. Camels milke of all others is thinnest, and Mares milke next to it. Asses milke is holden for to be thickest, and therefore they vse it in stead of renning, to turn milke and gather curds thereof. It is thought also to be very good for to make womens skin faire and white. Certes the Empreffe *Poppae*, wife to *Domitius Nero*, had alwaies wheresoeuer she went, 500 she Asses milch, in her train: and in their milke she bathed and washed her whole body, as in an ordinary bain, supposing that thereby her skin was not only whiter, but also more neat, smooth, and void of riuels. All sorts of milke will thicken with fire, and turne into whey with cold. Cowes milke maketh more cheefe than Goats milke, by twice as much almost, although you take no more of the one than the other. The milke of those that haue about foure paps is naught for cheefe: but theirs is better that haue but twain. The renner of an hind-calse or Leueret, and a Kid, is much commended. But especially of a Leueret or Rabbet, which also is medicinable for the flux of the belly: a thing to be obserued in them alone, of all creatures that are toothed in both chawes. A wonder it is, that barbarous nations liuing of milke, haue for so many hundred yeares either not knowne, or else not regarded the benefit of cheefe: and yet they vse to thicken their milke into a kind of pleasant foure curd in manner of a Sellibub; and to charn butter thereof, which is the skum and cream of milke, much thicker than that which is called whey. To conclude, I may not let passe, That Butter hath the vertue and properties of oile: inso much as forrein and barbarous nations do anoint their children therewith, as we also do ours.

CHAP. XLII.

¶ Cheeses of sundry sorts.

AT Rome (the only place that hath best meanes neere at hand, to judge of the fruits and commodities of all nations in the world) the cheeses which come out of the prouinces of Nemausium, and from the villages of Læso and Baux, are highly praised for the best; but they last not long: their commendation is for the present season while they be greene and new. There are brought good cheeses from two coasts of the Alps, which greatly praise the pasture thereabout. Also dainty cheeses are made in Dalmatia, from whence we haue passing good; and namely from Drinaldi. Moreouer, the prouince of Ceutronia sends vs excellent cheefe from Vatufium. But the great store and plenty of cheefe commeth from the Apennine mountain: which yeeldeth vs the Cebane cheefe out of Liguria, which is very fine meate, notwithstanding it be made most of cws milke. Also out of Vmbria we haue good cheefe, from the dairies along the riuier *Ætio*. Howbeit in the confines between Tuscane and Liguria, the most famous great cheeses are made, and namely about Luca, for one of them weigheth a thousand pounds.

A pounds. Next to these in goodnesse be those that are made neer the city of Rome about Vestinum: but from out of the Seditian territory and the plains thereabout, there come cheeses that passe all the rest. As for cheeses made of goats milke, they are not to be defrauded of their due praise, especially when they are fresh and new made: and if besides, they may haue a little driness in smoke, which giueth both a good lustre, and also a pretty tast to them: for such cheeses be made within the very city of Rome, and go beyond all others. As for the cheeses made in France, they taste like a medicine, and haue an aromatical relish with them. For outlandish cheeses beyond-sea the Bithynian carry the best name. That there is a certain tarter or saltier (if by nothing els) may well be known by the tast of the cheefe made thereof: for there is none; but the older they are, the more saltish they be: yet such are well known to recouer their fresh taste again, if they be soaked in Thyme vinegre. Some report, that *Zoroastres* liued in the desert wildeernesse 20 yeares with cheefe: the which was so well tempered, that it seemed nothing old, for it neither moulded nor yet bred vermin.

CHAP. XLIII.

¶ The difference between the members of Man and other Creatures.

OF liuing creatures vpon the land, Man alone is two footed. He only hath a canell bone and shoulders, armes also to embrace: whereas others haue shoulders only & fore-legs to rest vpon. In all creatures that haue hands, they be fleshy within-forth only: for the back part consists of skin and sinewes. Some men there be with six fingers to one hand. Wee haue heard, that *M. Curiatius* a Nobleman of Rome had two daughters so handed: whereupon they were called *Sedigitæ*. Also there was a man named *Volcatius*, who was an excellent poet, and had six fingers to an hand, whereupon he was named *Sedigitus*. Euery finger of a mans hand hath three joints; the thumbe twaine, and it bendeth and boweth full opposite to all the rest of the fingers: and yet by it selfe it stretcheth awry from the others, and is thicker than the rest of the fingers. The little finger is equall in length to the thumbe: the fore-finger and the fifth (or ring finger) are iust of one size: betweene which the middle finger is the longest. Those foure footed beasts that liue of rauine and prey haue five toes to their fore-feet, whereas others haue but foure: Lions, Wolves, and Dogs, and some few others, haue likewise 5 toes or pawes in their hin-feet, and one like a spur, which beares forth behind, and hangs down from the paterne bone of the foot. All other smaller beasts haue five to a foot. The armes of all men be not of a iust and euen measure: for it is well known, That there was a Thracian sword-Fencer named *Studiosus*, belonging to the fence-school of *C. Caligula* the Emperour, whose right arme was longer than the left. Certaine beasts without reason vse the ministry of their fore-feet in stead of hands, and as they sit on their rumpe reach meat therewith to their mouth, as Squirils.

CHAP. XLIV.

¶ The resemblance that Apes haue to men.

AS for all the race and kind of Apes, they resemble the proportion of men perfectly in the face, nose, eares, and eye-lids; which eye-lids these creatures alone (of all foure-footed) haue under their eyes as well as aboue: nay, they haue paps and nipples in their breasts, as women: armes also and legs bending contrarie waies, euen as ours doe. Nails they haue also and fingers like to vs, with the middle finger longer than the rest, as ours be. A little they differ from vs in the feet; for somewhat long they are, like as their hands be; and the sole of their foot is answerable to the palm of their hand. Thumbs and great toes they haue moreover, with joints directly like a man. And setting aside the member of generation, and that only in the he Ape, all inward parts are the very same that ours, as if they were made iust by one patterne.

CHAP. XLV.

¶ Of Nails.

NAiles are taken and reputed for the extremities and vtmost ends of the sinewes: and ye shall finde them in as many as haue fingers and toes. But in Apes they are channelled halfe

halfe round like a gutter tile, whereas in man they be flat and broad. When one is dead they will grow. In rauous creatures hooked they be and bowing inward : in dogs right and strait, saue only that which in most of them crooks from behind their legs like a spur. All creatures that haue the fashion of a foot, haue toes thereto except an Elephant. And yet he seems to haue an appearance of five in number, but they are not diuided asunder, or if they be, they are not distinct one from another but very sleightly, and like rather to houfs than nails : the forefeet also are bigger than the hinder. In the hin-feet they haue short ioints. The elephant bends his hams inward, as doth a man : whereas all other liuing creatures bow the ioints of their hinder legs, otherwife than of the former. For such as ingender and breed yong aliue bend their knees before them : but the ioint of their hough behind clean backward. Mens knees and elbows bow contrary one to the other : so do Beares and all the sort of Apes, which is the cause they be not so swift of foot as others. Four footed beasts, as many as lay eggs (as the Crocodile and Lizards) haue their knees before, bending backward ; but those behind bowing forward : and yet their legs be crooked like a mans thumb. In like sort, they that haue many feet : vnlesse it be the hin feet of all, in as many as do skip and hop ; for they all be straight. Birds, after the manner of foure footed beasts, doe bow their wings forward, but the ioint of their legges backward.

In the knees of men there is generally reposed a certaine religious reuerence, obserued euen in all nations of the world : for humble suppliants creep and crouch to the knees of their superiors : their knees they touch, to their knees they reach forth their hands : their knees (I say) they worship and adore as religiously as the very altars of the gods : and for good reason haply they do so, because it is commonly receiued, That in them there lies much vital strength. For in the very ioint and knitting of both knees, on either side thereof before there are two emptie bladders as it were, like a paire of cheeks, which hollownesse and concauitie if it be wounded and pierced through, causeth as present death as if the throat were cut. In other parts likewise of the body we vse a certain religious ceremonie : for as our maner is to offer the backe part of the right hand to be kissed, so we put it forth and giue it as well in testimonie of faith and fidelitie. It was an antient fashion in Greece, when they would make court and with great respect tender a supplication to some great personage, to touch the chin. In the tender lappet of the eare is supposed to rest the seat of remembrance, which we vse to touch when we mean to take one to beare witness of an arte or other thing done, and to depose the same in the face of the court. Moreover, behind the right eare likewise is the proper place of *Nemesis* (which goddesse could neuer yet find a Latine name, so much as in the very Capitol) and that place are we wont to touch with the fourth finger (which is next the least) in token of repentance, when we haue let fall some word rashly, and would craue pardon of the gods therefore. The crooked and swelling veins in the legs man alone hath, and women very feldome. *Oppius* writes, that *C. Marius* (who had bin Consul of Rome 7 times) endured, without sitting down for the matter, to haue those veins taken forth of his legs, a thing that neuer any was known to abide before him. All foure-footed beasts begin to go ordinarily on the right hand, and vse to ly downe on the right side : others go as they list. Lions and Camels only haue this propertie by themselves, to keep pace in their march, foot by foot, that is to say, they neuer set their left foot before their right, nor ouer-reach with it, but let it gently come short of it and follow after. Men & women haue the greatest feet in proportion of all creatures : but females vsually in euery kind haue lesse & slenderer feet than males. Men and women only haue calues in their legs, and their legs full of flesh. Howbeit we reade in some writers, That there was one man in Egypt had no calfe at all to his legs, but was legged like a crane. Man alone hath palmes of his hands, & broad flat soles to his feet ; and yet some there be who that way are deformed and disfigured. And thereupon it came that diuers came to be surnamed *Planci* [i. flat footed :] *Plauzi* [i. splay footed :] *Scauri*, [i. with their ancles standing ouermuch out :] *Pausti*, [i. broad footed.] Like as of their misshapen legs some haue bin named *Vari* [i. wry legged :] others, *Vatie*, and *Fatinij*, [i. bow-legged :] which imperfections beasts also are subiect vnto. Whole hoofed are all they that beare not horns : in regard wherof they be armed with house in stead of that offensive weapon : and such as they be haue no ancle bones : but all clouen footed haue those bones. Howbeit all that haue toes want ancles : and in a word, there is not one hath them in the fore-feet. Camels haue ancles like to Kine and Oxen, but somewhat lesse : for indeed they be clouen footed, although the

A the partition be very little, and hardy discerned vnder the foot, but seemeth flesh all ouer the sole, as Beares also, which is the cause, that if they trauaile farre vnshod, their feet are surbated, and the beasts will tire.

CHAP. XLVI.

¶ A discourse of beasts houses.

THE Houses of Horses, Mules, Asses, and such like beasts of carriage onely, if they be pared and cut, will grow againe. In some parts of Sclauonia, the Swine are not clouen-footed, but whole hoofed. All horned beasts in manner be clouen-footed : but no beast beares two hornes, and hath withall the house of one entire peece. The Indian Ass hath onely one horne. The wild Goat also called Oryx, is clouen houfed, and yet hath but one horne. The Indian Ass moreover, of all the whole houfed beasts alone, hath the pasterne or ankle-bones. As for Swine, a mungrell kind they are thought to be of both, in regard of those bones ; and thereupon are reputed filthy and acursed. They that haue thought that a man had such, are soon convinced. As for the Once, he indeed alone of all those whose feet are diuided into toes, hath that which somewhat resembles a pasterne bone. So hath a Lion also, but that it is more crooked and winding. As for the streight pasterne bone indeed, it beareth out with a bellie in the joynt of the foot, and in that hollow concauitie wherein the said bone turnes, it is tied by ligaments.

CHAP. XLVII.

¶ Of Birds feet, and their Clawes or Tallons.

OF Fowles, some haue their feet diuided into clees and toes ; others be broad and flat footed : and some are betweene both ; which haue indeed their toes parted and distinct, and yet their feet be broad between. But of all them that haue foure toes to a foot : to wit, 3 in the forepart, and one behind at the heele in manner of a spur : howbeit this one is wanting in some, that are long legged. The Vrinecke or Hickway, with some few others, haue two before and other two behind. The same bird putteth out a tongue of great length, like to serpents. It turneth the necke about and looketh backward : great clawes it hath like those of Choughes. Some bigger birds haue in their legs one other shanke-bone more than ordinarie. None that haue crooked tallons, be long legged. All that stauke with long shankes, as they fly stretch out their legges in length to their tailles : but such as be short legged, draw them vp to the midst of their belly. They that say, No bird is without feet : affirme also, That * Martinets haue feet : like as also the swift Swallow called Oce, and the sea Swallow Drepanis. And yet such birds come so little abroad, that they be feldome seen. To conclude, there haue been now of late, Serpents knowne flat-footed like Geese.

CHAP. XLVIII.

¶ Of the feet of Insects.

ALL Insects hauing hard eies, haue their fore-legges longer than the rest, to the end that otherwhiles they might with them, scoure their eies, as we see some flies doe : but those whose hinder-legs are longest, vse to skip and hop, as Locusts. Howbeit, all of them haue six legs apeece. Some Spiders there be, that haue two ouer and about the ordinarie, and those be very long : and euery leg hath three ioynts. As for some sea-fishes, we haue said before that they haue eight legs : namely, Many feet, Pourcuttles, Cuttles, Calamaries, and Crabfishes : and those moue their fore-clees like armes a contrary way, but their feet either they turne round or else fetch them crooked at one side : and a man shall not see any liuing creature againe, al round, but they. As for others, they haue two feet to guide them and lead the way ; but Crabs onely haue foure. There be Insects besides vpon the land, that exceed this number of feet ; and then, they haue no fewer than twelue : as the most sort of wormes : yea and some of them reach to an hundred. No creature whatsoeuer hath an odde foot. As touching the legs of those which be whole houfed, they be all full as long when they first come into the world, as euer they will be : well may they shoot out bigger and burnish afterward, but (to speake truly and properly) they grow

grow no more in length. And therefore when they be yong sucking soles, a man shall see them scratch the haire with the hinder feet: which, as they wax elder and bigger, they are not able to do, because their legges thrue only in outward compasse, and not in length. Which also is the cause, that when they be new soled, they cannot feed themselves but kneeling, vntill such time as their neckes be come to their full growth and iust proportion.

CHAP. XLIX.

¶ Of Dwarfs: and genitall parts.

There are no liuing creatures in the world (euen the very fowles of the aire not excepted) but in each kind there be dwarfs to be found. As for those males which haue their instruments of generation behind, we haue sufficiently spoken. In Wolues, Foxes, Weefils, and Ferrits, those genitall members be of a bonie substance; and of them there be soueraigne medicines made, for to cure the stone and grauell in mans bodie engendred. The Beares pisse also, becommeth as hard as an horn (men say) so soone as his breath is out of his bodie. As for Camels pisses, they vse in the East countries to make their best bow strings therof, which they account to be the surest of all others. Moreouer and besides, the genitall parts put a difference between nation and nation; also between one religion and another: for the priests of *Cybele* (the great mother of the gods) vse to cut off their owne members and to gueld themselves, without danger of death. On the contrarie side, some few women there be, monstrous that way, and in that part resemble men: like as we see there are Hermaphrodites, furnished with the members of both sexe. In the daies of *Nero* the Emperour, the like accident was seen (and neuer before) in some foure-footed beasts. For he, in very truth, exhibited a shew of certaine mares that were of the nature of those Hermaphrodites, found in the territorie of *Treuers* in France: and they drew together in his owne coach. And verily a strange and wondrous sight this was, To see the great monarch of the world, sit in a charriot drawne by such monstrous beasts. As touching the stones of Rams Buckes, and greater beasts, they hang dangling downe between their legs: but in Bores, they be thrust together, & knit vp short close to the bellie. Dolphines haue these parts very long, and the same lying hidden within the bottom of their bellies. In Elephants likewise they be close and hidden. In as many creatures as doe lay egges, the stones sticke hard to their loines within the bodie: and such be euermost quicke of dispatch in the act of generation, and soone haue done the feat. Fishes and Serpents haue none at all; but in stead thereof there be two strings or veines reach from their kidnies to their genitall member. The * Buzzard (a kind of Hawke) is provided of three stones. A man hath his cods somer time bruised and broken, either by some extraordinarie accident, or naturally: and such as be thus burst, are counted but halfe men, and of a middle nature betweene Hermaphrodites and guelded persons. To conclude, in all liuing creatures whatsoeuer, the males be stronger than the females, setting aside the race of Panthers and Beares.

CHAP. L.

¶ Of Tails.

There is not a liuing creature, excepting men and Apes (take as well those that bring forth their yong aliue, as others that lay egges only) but is furnished with a taile, for the necessarie vse of their bodies. Such as be otherwise rough-haired and bristly, yet haue naked tiales, as Swine: those that be long shagged and rugged, haue very little and short skuts, as Beares: but as many as haue long side haire, be likewise long tailed, as Horses. If Lizards or Serpents haue their tiales cut off from their bodies, they will grow againe. In fishes they serue in good stead, as rudders and helmes to direct them in their swimming: yea they fit their turnes as well as oares, to set them forward as they stirre them, to this or that hand. There be Lizards found with double tiales. Kine and Oxen haue the longest rumpe for their tiales of any other beasts; yea and the same at the end, hath the greatest tuft and bush of haire. Asses haue the said docke or rumpe longer than horses: and yet all such beasts either for saddle or packe, haue it set forth with long haire. Lions tiales are fashioned in the very tip thereof, like vnto Kine or Oxen, and Rats: but Panthers are not after the same manner tailed. Foxes and Wolues

haue

A haue shag tiales like sheepe, but that they be longer. Swine carie their tiales turned and twined round. And Dogs, that be of cures kind and good for nothing, carrie their tiales close vnderneath their bellies.

CHAP. LI.

¶ Of Voices.

Aristotle is of opinion, That no liuing creature hath any voice, but such only as are furnished with lungs and wind-pipes: that is to say, which breath and draw their wind: and therefore he holdeth, that the noise which we heare come from Insects, is no voice at all, but a very sound, occasioned by the aire that gets within them, and so being enclosed, yeelds a certaine noise, and resoundeth againe. And thus it is (quoth he) that some keep a humming or buzzing, as Bees: others make a cricking with a certain long traine, as the Grasshoppers; for euident it is, and wel known, that the aire entering into those pipes (if I may so term them) vnder their breast, and meeting with a certaine pellicle or thin skin, beates vpon it within, and so sets it a stirring, by which attrition, that shrill sound commeth. Again, it is as apparent, that in others, and namely, Flies and Bees, the buzzing which we heare, begins and ends euermore with their flying. For (no doubt) that sound commeth not of any wind: that these little creatures either draw or deliuer, but of the aire which they hold inclosed within, and the beating of their wings together. As for Locusts, it is generally beleued & receiued, that they make that sound with clapping of their feathers and wings and thighs together. In like manner, among fishes in the waters, the great Scallops make a certaine noise as they shoot out of the water. But soft fishes and such as lie couered with a crust or shell, neither vtter voice, nor yet yeeld sound. As for other fishes, although they be without lungs and pipes, yet are they not quite mute, but deliuer a certaine sound. Howbeit, they that would maintaine, that fishes are dumbe indeed, doe cauill and say, that such a noise commeth of crashing and grinding their teeth together. But what will they say then to the water-Goat, & the riuer Bore, which in the riuer Achelous do euidently grunt: as also others, wherof we haue spoken? Again, such as lay eggs do hisse: and Serpents draw their hissing out in length. The Tortoise hisses likewise, but after a broken manner, with staies and rests between. Frogs keep a croaking after their kind, as hath been said before: and yet a man may seem well to doubt thereof, how it should be: considering, that the noise which they make comes but from their teeth and mouth outward, and is not framed in their breast or stomacke. Howbeit, in them there is great difference, by occasion of the nature of diuers countries. For in Macedonie (by report) they are mute: and there also the Swine be dumbe. As for birds, the least euermore be most full of chirping, chaunting, and singing; and most of all, about the breeding time. Some of them keepe a singing when they fight, as Quails: others, when they goe to fight, as Partridges: and some again after victorie, as cocks. And they haue a crowing by themselves differing from the cackling of hens: whereas in other birds you canot discern the male from the female by the singing, as we see in Nightringales. Some sing all the yeare long, others at certaine times, as we haue more at large declared, in the particular treatise of each bird. The Elephant he sends out at his very mouth (somewhat short of his muffle) a certaine sound like to sweet singing: but thorough that muffle or trunk of his, he sounds (as it were) out of a trumpet. Kine only of females, haue a bigger voice than Bulls: for in euery kind else the female hath a smaller voice than the males: like as we see in mankind, the gelded Eunuchs. As an infant is comming into the world, it is not heard to crie all the while that it is in the birth, before it be fully born. When it is a yeare old, it begins to prattle and talke, but not before. King *Cresus* had a sonne, who lying swaddled in his cradle, spake by that time he was 6 months old: but this was a prodigious signe, and presaged the finall ruine of that kingdome. Those children that begin with their tongue betime, are later ere they find their feet. The voice in man or woman beginneth to change and waxe greater at 14 yeares old. The same in old age growes again to be smaller: and in no other creature doth it more often alter. Moreouer, as touching the Voice, there be strange and wonderful matters reported, and those worth the rehearsal in this place. For first and foremost we do see, That vpon the skaffold or stage in publick Theatres, if the floore be strowed ouer well and thicke with saw-dust or sand, the voice of the actors will be drowned and lost, yea, and remain still about the skaffold, as if it were there buried: also where there be hollow and vn-

H h 3

euen

euen wals round about or emptie drie-fats and tuns set, the voice will be taken vp in them, and passe no farther. But the same voice, betweene two wals directly set one by another, runs apace: yea, and through a vault it may be heard from the one end to the other, be the sound neuer so low; provided, that all be smooth and euen between, and nothing to hinder the passage thereof. To speake yet somewhat more of the Voice: In it doth rest a great part of the countenance and visage of man, wherby he is discerned and knowne. For we know a man by hearing his voice before we see him, euen as well as if our eies were fixed vpon him. And see how many men and women there are in the world, so many sundrie voices there bee, for each one hath a feuerall voice, as well as a face, by himself. And hereof arises that varietie of nations, that diuersitie of languages all the world through. From hence come so many tunes in song, so many notes in Musick, as there bee. But aboue all, the greatest thing to be noted in Voice, is this, That wheras the vtterance of our mind, thereby doth distinguish vs from brute and wild beasts: the same euen among men maketh as great a difference betweene one and another, as the other is betweene man and beast.

CHAP. LII.

¶ *Of the excreescence and superfluitie of some members. Also the discourse and sayings of Aristotle as touching mans life*

Looke what part is more than ordinarie by nature, in any liuing creature, the same serues to no vse. As for example, the sixth finger in a mans hand is euermore superfluous, and therefore fit for nothing. It was thought good in Ægypt once to nourish and keep a monstrous man who had foure eies, wherof two stood in the backe part of his head behind: but surely he saw neuer a whit with them. I wonder verily, that Aristotle not only beleueed, but also sticked not to set downe in writing, that there were certaine signes in mans bodie, whereby we might foreknow whether he were long liued or no. Which, albeit I take to be but vanities, & not rashly to bee vttered without good aduise-ment (because I would not haue men amused, and busily occupied in searching Prognostications in themselves, as touching their owne life) yet will I touch the same, and deliuer them in some sort, since so great a clerk as Aristotle was, held them for Resolutions, and thought them worth the penning. He putteth downe therefore, as signes of short life, thin teeth, long fingers, a leaden hew, many lines in the palme of the hand, with crosse bars or short cuts. Contrariwise, he saith, That those who are Lute backed, thicke shouldered, and bending forward, who also in one hand haue two long life lines, and aboue 32 teeth in their head, and besides are wel hanged, and haue large eares, bee long liued. And as far as I can guesse, he requires not, that all these signes should concur and meet together, for to signifie as is before said: but, as I suppose, his meaning is that euery one of them by it selfe is significatiue and sufficient. Surely, these Physiognomers & Chiromantines or Palmestrie, as friuolous and foolish as they be, yet now adaiies are in credite, and euery man is full of them. *Trogus*, a most graue and renowned Author among vs, is of opinion moreouer, That there is judgment to be giuen, not only of mens complexions, but also of their conditions, by their very sight & countenance: and surely, I think it not amisse to set downe his very words. A large and broad forehead (saith he) is a token of a dull conceit and heauie vnderstanding: and contrariwise, they that haue a little forehead, are by nature, fickle and inconstant: and finally, a round forehead, and bearing out argues anger and chollier, as if this outward tumor thereof bewraied the swelling and boiling, of that humor. In whomsoever the eie-browes are streight and lie euen, they betoken soft and effeminate persons: but if they bend and bow toward the nose, they shew austeritie. Say their turning and bending be toward the temples of the head, they are signes of a mocker and scorner: finally where they lie very low, such persons (be ye sure) are malicious, spitefull, and enuious. Long eies, in whomsoever they bee, do testifie hurtfull and dangerous persons. They that haue the corners full of flesh, are of a malicious nature: where the white of the eie is spread large and broad, it is a token of impudencie. And such as euery whiles bewinking and closing of their eie-lids, (trust me truly) they be giddie-headed, and vnstaid. Those that haue great eares, and especially the laps thereof, make account they be blabs of their tongue, and fooles withal. Thus much of Physiognomie, according to *Trogus*.

CHAP.

CHAP. LIII.

¶ *Of the Spirit and breath of liuing creatures: also what things be venomous in taste, and do kill. Of mens food. And last of all, what hindereth digestion and concoction of meat.*

The breath of Lions hath a very strong deane and stinking smell with it: but that of a beare is pestilentiall and deadly: in so much, as no beast will touch where a beare hath breathed and blown vpon: for surely such will sooner corrupt & putrifie than others, as if they were blasted. As for the breath of a man, Nature hath suffered it to be infected many waies, namely, by the viands and meat that he eateth, by faulty and rotten teeth; and most of all by old age. And yet our breath, without which there is no fence, feeleth no pain it selfe, as being void of feeling and altogether senselesse. The same goeth and commeth continually without rest and intermission: the same is alwaies new and fresh: and as it shal depart out of the body last, so it shal remaine alone, when all is gon besides it. Finally, returne it shal into the aire and the heauen, from whence it first came. Now, albeit this breath that we draw, be the very means whereby we liue, and without which we cannot maintain our life, yet otherwhiles troublesome it is vnto vs, and plagueth vs as a very punishment ordained for vs. The Parthians of all others be most subiect to this inconuenience, euen from their very youth, by reason of the grosse feeding of all meats indifferently, without choise and discretion: and specially of their drunkenesse. For excessive drinking of wine causeth stinking breath. But the Nobles and great States of that countrey haue a remedy therfore, and make their breath sweet, by taking with their meats the kernels of Pome-granates, which yeeld a most pleasant sauer. The very breath of Elephants causeth Serpents to come out of their holes: but Stags and such other Deere, therewith do blast & burn them. As touching certain kinds of men, who by sucking only could draw & fetch out the poison out of bodies wounded by venomous Serpents, we haue already spoken. As for hogs, they will feed of Serpents, and do well enough, wheras to other creatures they be no better than poison. All those little creatures, which we named Insects, will die if they be but sprinkled or wet with oile. The Vultures or Geires which flie from sweet ointments, are desirous yet of other odors and perfumes: like as Beetles like well the smell of Roses. Some Serpents there be that the Scorpion kils. The Scythians poison their arrow-heads with the venomous filthy bloud of vipers and mans together. A present poison this is, and remediless; and it no sooner toucheth but it taketh, and killeth forthwith. As touching those creatures that feed of poison, we haue spoken heretofore. Moreouer, some creatures there be, which otherwise being harmlesse, if they be fed with venomous beasts or plants, become also themselves noisome & dangerous. The wild bores in Pamphylia, and vpon mountains of Cilicia, that haue eaten Salamanders, become venomous: and whosoever chance to eat of their venison, are sure to die vpon it. And yet cannot a man know any such venome therein, either by sent at nose, or tast of tongue. Moreouer, the very water or wine wherein a Salamander hath bin stifled and suffocated, or whereof it hath but drunk, will kil a man that shall but sip thereof neuer so little. The like is to be said of that Frog which we call *Rubra* [i. the toad that liues in bushes.] See how many ambushes our life is subiect vnto! Wasps feed greedily vpon Serpents, and vpon that food their stings be deadly. And therefore you see it skilleth much what meats we eat, and the manner of our food is very material. As we may learn farther in that treatise which *Theophrastus* wrote of the Ichthyophagi that liue of fish: where he hath set downe, That Kine and Oxen doth eat fish, but they must in any case be aliae.

To come now vnto mens diet: their best and most wholesome feeding is vpon one dish and no more, and the same plaine and simple: for surely this huddling of many meats one vpon another of diuers tastes is pestiferous: but surdrie sauces are more dangerous than that. As touching our concoction: all tart and sharp meats are of hard digestion: also fulnesse and surfeting: hasty and greedie feeding likewise be enemies to digestion, and hurtful to the stomack. In sum, we digest our meat more hardly in Summer than in Winter, and in age worse than in youth. Now to helpe and remedie all this excesse and enormitie, vomite hath bene deuised: but vse it whosoever will, he shall find the naturall heat of his bodie thereby to decay: he shal sensibly perceiue that it hurteth the teeth, and eies especially. To goe to bed vpon a full stomack, and

to digest in sleepe, is better to make a man fat and corpulent, than strong and lusty. And therefore wrestlers and champions who are acquainted with ful & liberall diet, vse rather to walk after meat for to digest. And in one word, much watching maketh best digestion.

CHAP. LIIII.

¶ Of making bodics fat or leane. Also, what things being tasted, do allay hunger, and quench thirst.

Bodies grow to be burly and grosse, with sweet meats, fat feeding, & much drinke: contrariwise, drie diet, & actually cold, and thirst withal, make a body lean. There be beasts in Africk, and especially the lesser sort, which drink not aboue once in foure daies. A man may well liue 7 daies without any food whatsoeuer: & wel is it knowne, that many haue continued more than 11 daies without meat or drink. There haue bin some known to hungry euermore that nothing would satisfie them, and such haue died for very famine, although they did nothing else but eat: a disease incident to no creature but a man. Some again can assuage and appease their hunger, yea, and slack and extinguisht their thirst with a very little, and yet preserve & maintain the naturall strength of their body: namely, with tasting butter, cheese made of Mares or Affes milk, and Licorice. But to conclude and knit vp this discourse: the worst and most dangerous thing euery way that can be in all the course of our life, is Excesse and Superfluity; but to the health of our bodics most of all: and therefore the best course is, to cut off by all means that which is offensiu and heauy to the body. Thus much shall suffice as touching liuing and sensible creatures. Let vs therefore now proceed to the rest of Natures workes.

THE TWELFTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS
SECVNDVS.

The Proeme.

Hus you see by that which hath bin written before, what are the natures as well in generall, as particularly in parts, of all liuing and sensitiue creatures within the compasse of our knowledge. It remaineth now to discourse of those which the earth yeeldeth: and euen they likewise are not without a soule in their kind (for nothing liues which wanteth it:) that from thence we may passe to those things that lie hidden within the earth, and are to be digged out of it: to the end, that no worke and benefit of Nature might ouerpasse our hands, and be omitted. And in truth, these treasures of hers lay long covered vnder the ground, in so much as men were perswaded, that Woods & Trees were the last & only goods left vnto vs and bestowed vpon vs by Nature. For of the fruit of trees had we our first food: their leaues and branches serued to make vs soft pallats and couches within the caves: and with their rinds and bark we clad and covered our nakednesse. And euen at this day, some Nations there be that liue still in that sort, and no otherwise. A wonderfull thing therefore it is, that from so small and base beginnings we should grow to that passe in pride, that we must needs cut through great mountaines for to meet with marble: send out as far as to the Seres for silk stuffe to apparell vs: diue downe into the bottome of the red sea for pearls: and last of all sinke deepe pits euen to the bottom of the earth, for the precious Hæmerauld. For this pride and

vanitie

A vanitie of ours, we haue deuised means to pierce and wound our eares: because, forsooth it would not serue our turns to weare costly pearles and rich stones in carkanets about our necke, borders vpon the haire of our head, bracelets about our arms, and rings on our fingers: vnlesse they were ingrauen also, and cut into the very flesh of our bodics. Well then, to follow the course of Nature, and the order of our life (as meet it is we should) we will treat in the first place of Trees, and lay before mens eyes the life of the old world, and what was their behaviour and demeanure at the first, in their manner of liuing.

CHAP. I.

¶ The honour done in old time to Trees: When the Plane-trees were first knowne in Italy, and of their nature.

Bold time, Trees were the very temples of the gods: and according to that ancient manner, the plaine and simple peasants of the country, fauoring still of antiquity, do at this day consecrate to one god or other, the goodliest and fairest Trees that they can meet withal. And verily we our selues adore not with more reuerence & deuotion the stately Images of the gods within our temples (made though they be of glittering gold, and beautifull yuorie) than the very groues and tufts of trees, wherein we worship the same gods in all religious silence. First and foremost, the ancient ceremonie of dedicating this and that kind of Tree to seuerall gods, as proper and peculiar vnto them, was alwaies obserued, and continueth yet to this day. For the mighty great **C** Oke named *Æsculus*, is consecrated to *Iupiter*; the Laurel to *Apollo*; the Oliue tree to *Minerua*; the Myrtle to *Venus*; and the Poplar to *Hercules*. Moreover, it is receiued and beleued generally, That the Syluans and Faunes, yea, and certaine goddesses, are appropriate and assigned to woods and Forrests; yea, there is attributed vnto those places a certain diuine power and god-head, there to inhabit: as well as vnto heauen the proper seate for other gods and goddesses. Afterwards, in proesse of time men began to taste also the fruit of Trees, and found therein a iuice (without all comparifon) more lenitiue and pleasant to the contentment of their nature than that which came of corn and grain: for therof made they Oile, a singular liquor to refresh and comfort the outward members and parts of the body: out of it they pressed wine, the onely drinke that giueth strength within, and fortifieth the vitall powers. From thence gather we many fruits, yerely growing and comming of themselves without the labour and industry of man. And albeit, to serue our belly & please our tooth, we stick not to maintain fight and deale in combat with wild beasts in the Forrests; although we hazard our selues in the sea, to meet with monstrous fishes which are fed with the dead bodies of men cast away by shipwracke; and all to furnish and set out the table; yet is not the cheare thought good enough, vnlesse fruits also be sent vp at the later end, that they may haue the honor in all feasts of the second seruice, and the banquet. Besides all this, Trees serue our turns for a thousand necessary vses, without which our life could not be well maintained. With Trees we saile ouer seas into strange lands, and by transporting commodities and merchandise too & fro, we make lands meet together: of Trees we build our houses, wherein we dwell. Trees were the matter in times past, whereof were made the images of the gods. For as yet no man thought of the costly Anatomy of the elephant, neither was their tooth in any account: whereas now adaeies we make the tressels, frames, and feet of our tables, euen of the same yuory that we see the faces of gods are portraied of, as if we had our warrant from them to begin & maintain our riot and superfluity in this behalf. We find in old **E** Chronicles, That the Frenchmen and Gaules took occasion first to come down into Italy, & to ouerspread the whole country (notwithstanding they were beforetime debarred from thence by the impregnable fort, as it were, and the vnpassable bulwark of the Alps betweene:) because one *Elico*, a Swisser or Heluetian, who had made long abode at Rome (where he was entertained for his skil in Smiths worke and Carpentry) at his return home again into his country, brought ouer with him dry figs and Raisons: the first fruits also as it were of oile & wine for a tast, to set their teeth a watering. And therefore the French had good reason, and might wel be born withall and pardoned, for seeking to conquer euen by force of armes those countries where such fruits grew. But who would not maruell rather at this, That our people here should go into far countries, and fetch a tree from thence, euen out of another world, only for the shade that it giueth?

veth? For surely, of fruitfull trees Italy hath store enough: and what tree should that be, but the very Plane? brought first ouer the Ionian sea into the Ile Diomedea, for to beautifie the tomb of *Diomedes*: from thence translated into Sicily, and so bestowed at length vpon Italy, & there planted as a most singular, rare, & speciall tree. But now is it carried as far as Terwin and Tourmay in France, where it is counted an appertenance to the very soile that paeth tribute: in so much, as people that wil but walk and refresh themselves vnder the shadow of it, must pay a custome therefore vnto the people of Rome. *Dionysius* king of Sicily, and the first of that name, caused them to be brought from Rhegium in Calabria to his Roial city, where his pallace was, only of a singularity, because they should be seen to giue a shade before his house, where afterwards was made the Colledge or place of publick exercise. But these trees did not greatly like the soile, for they neuer grew big, nor prospered to any purpose. Howbeit, I find in writers, that there were other besides in Italy, and namely about Adria, as also in Spain. And all this happened about the time that Rome was sackt by the Gauls. But afterwards they came to be so highly esteemed, that for to make them grow the better, men wolud be at the cost to water them with wine: for this was found by experience, that nothing was so good for them as to poure wine to their roots. Thus haue we taught euen our trees also to drinke wine, and be drunke. The Plane trees of any great name at first, were those that grew in the walking place of the Academia in Athens; where the root of one outwent the boughs 36 cubits in length. Now in this age there grows a famous one in Lycia, neer to the high way were men passe too & fro, & it hath a pleasant cold fountain adioining to it: the same is hollow within like to a house, & yeelds a caue of 8 foot in compasse: but it caries such an head withal like a groue, so large, so broad, & so branched, that euery arm resembles one entire tree: in so much, as the shade therof takes vp & spreadeth a great way into the fields. And because in euery respect, it might resemble a very cabbin and caue indeed, there are stony banks & seats within, in form of an arbor round about, made as it were of pumish stone ouergrown with mosse. And in truth, this tree, and the scituation therof is so admirable, that *Licinius Mutianus* thrice Consul, and lately Lieutenant generall and Gouernor of that Prouince, thought this one thing worthy to be recorded as a memoriall to posterity. That he and 18 more persons of his company, vsed to dine and sup within the hollownesse of that tree: where the very leaues yeelded of the own sufficient bed and bench-room to rest and repose themselves: where they might sit secured from danger of wind to blow vpon them: where whiles he sat at meat, he wished nothing more than the pleasure to heare the showers of rain to pat drop by drop, and rattle ouer his head vpon the leaues: & finally, that he tooke much more delight to lie within the said cabbin, than in a stately chamber built of fine marble, all glorious within with hangings of tapistrie and needleworke of sundry colours, and the same seeled ouer head with an embowed roofo laid with beaten gold. Moreover, *Caligula* the Emperour had such another Plane tree growing in the country about Velitra, most artificially: wherein he vsed to take great pleasure, with admiration of the sundry lofts and planks one ouer another, the large settles also and spacious branches that the boughs yeelded, where he was wont to sit at repast, making one of the 15 guests. For the room was of that capacity, that it would not only receiue so many to sit with ease at the table, but also the gentlemen and seruitors that waited and ministered vnto them: and he termed this supping place by the name of, His nest: because it seemed like a birds nest in a tree. There is to be seen at Gortyna, within the Island Candy, one Plane tree neere vnto a faire fountain: recorded it is as well by Greekes as Latines in their writings, and by the testimony of them both, neuer sheds the leaues, but remains alwaies green, as well in Winter as Summer: by occasion whereof arose the tale (so much giuen is Greece to deuise fables by and by of euery small matter) That *Jupiter* vnder that tree desloured the yong lady *Euroopa*: as if (forsooth) there were no other tree but it of the same kind and nature, in Cyprus. But as the nature of man is euermore curious, and seeketh after nouelties) the Candioes desirous to haue of the same race within Crete, set many slips thereof in sundry places, as if they longed to haue more such vicious fruit (as is before-named:) for in very deed that Tree is in no one thing more commendable, than for excluding the heat of the Sunne in Summer, and admitting it in Winter. In the time of *Claudius Casar*, late Emperour, there was an enfranchised slaue belonging to *Marcellus Eferminus*, a daintie guilded Eunuch of Thesalie, and exceeding rich, who caused certain Plane trees to be brought out of Candie into Italie, for to plant them at a manor which he had in the the territorie neare vnto Rome. This freed Eunuch for to grow into

more

A more power and fauor with *Casar*, had ingrafted himselfe, as adopted among his freed men: and surely for his wealth might well be called *Dionysius*, who was the first that transplanted these kind of trees. Thus you see, that ouer and aboue those monstrosities which Italy hath deuised of it selfe, we haue remaining and reigning among vs those also of strange and forraigne nations abroad in the world.

CHAP. II.

¶ Of the low or dwarfe Plane tree: And who first deuised to clip and shred Arbours.

B AS big as these Plane-trees, are yet there be those of a forced smallnesse to the other, called *Chamaeplatani*: whereby a man may see, that we haue inuented the meanes to haue abortiue trees also, euen to hinder their growth, that they cannot come to their full perfection. And therefore euen in Trees as well as in other liuing creatures, there is a certaine infelicitie, which may well be termed, A dwarfish vntowardnesse. This smallnesse in trees may come, by the manner of planting them, as well as by cutting and keeping them downe. The first man that deuised to shred and cut arbours, was one *Cn. Martius*, a gentleman of Rome, and a fauorite of the Emperour *Augustus*; and this inuention hath not bin knowne aboue 80 yeares.

CHAP. III.

¶ Of Trees that be strangers in Italy: and namely of the Citron or Limon Tree.

C Cherry-trees, Peach-trees, and generally all that either haue Greek names or any other but Latine, are held for aliens in Italy. Howbeit, some of them now are enfranchised and taken for free denizens among vs: so familiar they be made vnto vs, and they like the ground so well. But of them, we will speake in the ranke of those trees that beare fruit. For this present we are to treat of those that be meere forrainers: and for good lucke sake, begin we will with that which of all others is most holesome, to wit, the Citron tree, called the Assyrian tree; and by some, the Median Apple-tree: the fruit whereof is a counterpoison and singular Antidote against all venome. The tree it selfe, beares the leafe like vnto an Arbut tree; many it hath certain prickles among. The Pomecitron is not so good to be chewed and eaten of it selfe: howbeit very odoriferous it is: as be the leaues also therof, which are vsed to be laid in wardrobes among apparell, for the smel thereof wil passe into the cloths, and preserve them from the moth, spider and such like vermin. This tree beares fruit at all times of the yere; for when some fall for ripenesse, others wax mellow; and some again, begin then but to shew their blossome. Many forrainers haue assaied to transplant them, and set them in their own countries, in regard of their excellent vertue to resist poisons. And for this purpose they haue caried yong quicksets, or plants of them, in earthen pots made for the purpose, and inclosed them well with earth: howbeit the roots had liberty giuen them to breath (as it were) at certain holes for the pores, because they should not be clunged and pent in prison. Which I rather note, because I would haue it known once for all, and well remembered, That all plants which are to be remoued and carried far off, must be set very close, and vsed in the same order most precisely. But for all the care and paines taken about it, for to make it grow in other countries, yet would it not forget Media and Persia, nor like in any other soile, but soon die. This is that fruit, the kernels wherof (as I said before the lords and great men of Parthia vsed to seeth with their meat, for to correct their soure and stinking breaths. And verily there is not a tree in all Media, of better respect than is the Citron tree. As for those trees in the region of the Seres (which beare the silk wool or cotton) we haue spoken thereof in our Cosmographie, when we made mention of that Nation.

CHAP. IV.

¶ Of Indian Trees: and when the Ebene was first knowne at Rome.

I N like manner, discoursed we haue of the talnesse and greatnesse of Indian trees. Of all those trees which be appropriate to India, *Virgil* hath highly commended the Ebene aboue all the rest:

rest: and he affirmeth, That it will not grow elswhere. But *Herodotus* assigneth it rather to *Aethyopia*; and saith; That every three yeares the *Aethyopians* were wont to pay by way of tribute vnto the kings of Persia, * 1000 billers of the timber of that tree, together with gold and yuory. Moreouer, I must not forget (since that mine author hath so expressely set it downe) that the *Ethyopians* in the same regard were bound to pay in like manner, twentie great and masse Elephants teeth. In such estimation was yuorie then, namely in the 310 yeare after the foundation of Rome, at what time as *Herodotus* put forth that historie at Thuri in Italy. The more maruell it is, that we giue so much credit to that writer, saying as he doth, How that in his time & before, there was no man knowne in Asia or Greece, nor yet to himselfe, who had not so much as seen the river Po. The Card or Map of Ethiopia, which lately was presented and shewed to the Emperor *Nero*, as we haue before said, doth sufficiently testifie, That from Syene (which con-
fines and boundeth the lands of our Empire and dominion) as far as to the Island Meroe, for the space of 900 miles, there is little Ebene found: and that in all those parts betwene, there be few other trees to be found, but Date trees. Which peradventure may be a cause, That Ebene was counted a rich tribute, and deserved the third place, after Gold & Yuory. Certes, *Pompey* the Great, in that solemnitie of triumph for the victorie and conquest of *Mithridates*, shewed one Ebene tree. *Fabianus* is of opinion, that it wil not burne: howbeit, experience sheweth the contrary, for take fire it will, yea and cast a pleasant and sweet perfume. Two kindes there be of Ebene: the one, which as it is the better, so likewise it is rare and geason; it carrieth a trunk like another tree, without knot, the wood thereof is blacke and shining, and at the very first sight, faire and pleasant to the eie, without any art or polishing at all. The other is more like a shrub, and putteth forth twigs as the Tretrifolie. A plant this is, commonly to be seene in all parts of India.

CHAP. V.

¶ Of certaine Thornes, and Fig-trees of India.

Here groweth also among the Indians, a Thorne resembling the later kind of Ebene: and found to serue for the vse of candles: for no sooner commeth it neere vnto the fire, but it catcheth a flame, & the fire leaps presently vnto it. Now it remains to speak of those trees, which set *Alexander* the Great into a wonder, at what time as vpon his victory he made a voyage for to discouer that part of the world. First and formost, there is a fig tree there, which beareth very small and slender Figs. The property of this tree, is to plant and set it selfe without mans help. For it spreadeth out with mighty armes, and the lowest water-boughes vnderneath, doe bend so downward to the very earth, that they touch it againe, and lie vpon it: whereby, within one yeares space they will take fast root in the ground, and put forth a new Spring round about the Mother-tree: so as these branches thus growing, seeme like a traile or border of arbors most curiously and artificially made. Within these bowers the Shepherds vse to repose and take vp their harbor in Summer time: for shady and coole it is, and besides well fenced all about with a set of young trees in manner of a pallaisado. A most pleasant and delectable sight, whether a man either come neere, and looke into it, or stand a farre off: so faire and pleasant an harbour it is, all greene, and framed arch-wise in just compasse. Now the vpper boughes thereof stand vp on high, and beare a goodly tuft and head aloft like a little thicke wood or Forrest. And the body or trunk of the Mother is so great, that many of them take vp in compasse three score paces: and as for the foresaid shadow, it couereth in ground a quarter of a mile. The leaues of this Tree are verie broad, made in forme of an Amazonian or Turkish Targuet: which is the reason, that the Figges thereof are but small: considering that the leafe couereth it, and suffereth it not to grow vnto the full. Neither doe they hang thicke vpon the Tree, but here and there very thinne, and none of them bigger than a beane. Howbeit, so well and thoroughly ripened they bee with the heate of the Sunne, notwithstanding the leaues are betwene, that they yeeld a most pleasant and sweet rellice in tast, and are a fruit for a king, answerable to the mightie, huge, and prodigious tree that beareth it. These Fig-trees grow abundantly about the river Acefine.

CHAP.

A

CHAP. VI.

¶ Of the tree named Pala: of other Indian trees, whereof the names be unknowne. Also of those that beare wooll or Cotton.

Another tree there is in India, greater yet than the former, bearing a fruit much fairer, bigger, and sweeter than the figs aforesaid, and whereof the Indian Sages & Philosophers do ordinarily liue. The leafe resembleth birds wings, carrying three cubits in length, and two in bredth. The fruit it puts forth at the bark, hauing within it a wonderfull pleasant iuice: inso-much as one of them is sufficient to giue 4 men a competent and full refectiō. The trees name is Pala, and the fruit thereof is called Ariena. Great plenty of them is in the country of the Sydraci, the vtmost limit of *Alexander* the Great his expeditions and voiaes. And yet is there another tree much like to this, and beareth a fruit more delectable than this Ariena, howbeit, the guts in a mans belly it wringeth, and breeds the bloody-flux. Whereupon *Alexander* made open proclamation and straitly forbad, That no man should taste thereof. As for the Macedonian souldiers, they talked much of many other trees, but they described them in generall termes only, and to the most of them they gaue no names at all. For one tree there is besides, in other respects resembling the Terebinth, and it carrieth a fruit much like to Almonds; onely it is lesse, but of a most sweet and toothsome taste. In *Bactriana* verily, some take it to be a speciall kind of the Terebinth indeed, rather than a tree like vnto it: but that treewhich carrieth a fine flax, whereof they make their dainty linnen & lawn, it hath leaues like to those of the Mulberry tree, and beareth a red berry like to the hips of an Eglantine. They plant and set these in their fields and plains: and surely, standing as they do in such order, there are no rowes of any trees that yeeld a fairer sight and prospect. The Oliue tree of India is but barren, saue that it brings a fruit much like the Wild Oliue.

CHAP. VII.

¶ Of Pepper trees: of the Cloue tree, and many other.

The trees that beare Pepper euery where in those parts, be like vnto our Iuniper trees. And yet some haue written, That they grow only vpon the front of the hill Caucasus on that side which lieth full vpon the Sun. The corns or graines that hang thereupon, differ from Iuniper berries: and those lie in certain little huskes or cods like to the pulse called Fasse or Kidney beans. If that be plucked from the tree before they gape and open of themselves, they make that spice which is called long Pepper: but if as they do ripen, they cleaue and chawne by little & little, they shew within, the white pepper: which afterwards being parched in the Sun, changeth colour, and waxeth black, and therewith riueld also. Peppers be subiect to the injury of the weather as well as other fruits: for if the season be vnkindly and vntemperate, they will catch a blast, and then the seeds will be deafe, void, light, & naught. This fault is called among the Indians, Brechmasis, which in their language signifieth, an abortiue or vntimely fruit. This pepper of all other kinds is most biting and sharp, but it is the lightest, and pale of colour with all. The blacke is more kindly and pleasant: and the white is more milde in the mouth than both the other. Many haue taken Ginger (which some call Zimbiperi, and others Zingiberi) for the root of that tree: but it is not so, although in taste it somewhat resembles pepper. For Ginger grows in Arabia and Troglodytica in meadowes about the villages: and it is a white root of a certain little herbe. And howsoeuer it be very bitter and biting, yet it quickly meeteth with a worme, and rottes. A pound of Ginger is commonly sold at Rome for six deniers. Long pepper is soon sophisticated, with the Senuic or mustard-seed of Alexandria: & a pound of it is worth fifteen Roman deniers. The white costeth seuen deniers a pound, and the blacke is sold after foure deniers by the pound. As for Pepper, I wonder greatly that it should be so much in request as it is: for whereas some fruits are sweet and pleasant in taste, and therefore desired; others beautifull to the eie, and in that regard draw chapmen: Pepper hath neither the one nor the other. A fruit or berry it is (call it whether you will) neither acceptable to the tongue, nor delectable to the eie: and yet for the biting bitternesse that it hath, we are pleased therewith, and we must haue it set forsooth from as far as India. What was he, gladly would I know, that ventured

ture first to bite of pepper and vse it in his meats: Who might he be, that to prouoke his appetite and find himselfe a good stomach, could not make a shift with fasting and hunger onely? Surely, Ginger and Pepper both grow wild in those countries where they do like, and yet wee must buy them by weight, as we do gold and siluer. Of late daies here in Italy, wee haue made means to haue the Pepper tree growing among vs: and verily a litle scrubby plant it is, or shrub rather, bigger somewhat than the myrtle, and not far vnlike. The graine that ours beareth, carrieth the very same bitteresse that the greene pepper of India is thought to haue before it be full ripe. For here it wanteth the due parching and ripening against the sun: and by that means cometh short of the riuels and blacknesse that the outlandish pepper hath. Sophisticated it is, by intermingling with it the grains or berries of Iuniper: for surely, they do maruellous soon take the taste and strength of pepper. And as for the weight, there be diuers waies to deceiue the chapman therein.

Ouer and besides, there is another fruit that commeth out of India, like vnto pepper cornes, and it is called Cloues, but bigger somewhat and more brittle. And they say, that it groweth in a certain groue consecrated to their gods in India. Transported ouer it is vnto vs for the sweet smell that it casteth.

Moreouer, the Indians haue a thorny and prickly plant, which beareth a fruit like to pepper, and passing bitter: the leaues be smal and grow thick after the maner of Priuet: it putteth forth branches 3 cubits long: the bark is pale, the root broad and of a woody substance, resembling the colour of box. Of the infusion of this root in faire water, together with the seed, in a brasen vessell, is made that medicine or composition which is called Lycium. A bush there groweth likewise vpon mount Pelion [like Pyxiacantha, i. the Berberrie bush] whereof is made a counterfeite Lycium. In like manner, the root of the Asphodill, with an Oxe-gal, Wormewort, Frankincense, and the mother and lees of oile, wil do the same: but the best Lycium, and most medicinal, is that which doth yeld a great froth or scum. The Indian merchants do send it ouer in bags made of the skins either of Camels or Rhinocerotes. In some parts of Greece they name the very bush whereof this Lycium is made, Pyxacanthum Chironium.

CHAP. VIII.

¶ Of Macir, Sugar, and the trees of the region Ariana.

THE Macir likewise is brought out of India. A reddish bark or rind it is, of a great root, and beareth the name of the tree it selfe: but the form of that tree I know not how to describe. This rind sodden in hony, & so condit as a Succade, is a singular good medicine for those that be troubled with the Dysentery or bloody-flux: as for sugar, there is of it in Arabia; but the best comes out of India. * A kind of hony it is, gathered and candied in certaine Canes: white this is like gum [Arabick] and brittle between a mans teeth. The graines hereof when they are at the bigst, exceed not a silberd nut, and serue only for physick. In the realm of Ariana (which confineth and boundeth vpon the Indians) there is a certain thorny plant, so full of sharp pricks, that it is comberous to them who come about it; which yeelds a precious liquor issuing out thereof, like to Myrrhe. In the same prouince there grows a pestilent venomous shrubbe called Rhaphanus, bearing leaues like the bay tree, which with their fragrant smell train horses thither to eat thereof; but they are so good for them, that they left not Alexander the Great scarce one horse of all his Cauerrie, they died so fast of that food at his first entrance into the countrey. The like accident befell to him also among the Gedrosians. In like manner, there is another thornie plant (by report) in that region, leaued like the Laurell: the iuice and liquor whereof, if it be sprinkled or dashed in the eyes of any liuing creature whatsoeuer, puts them quite out and makes them blind. Moreouer, they haue an herb there, of a singular pleasant savor, but covered all ouer it is with little venomous serpents: their sting is present death. Onesicritus reports, That in the vales of Hircania there be trees like fig-trees, which the Hircanians call Occhi, out of which there distills or drops hony euery morning for the space of two houres.

CHAP. IX. ¶ Of Bdellium: and the trees growing by the Persian gulf.

N Eere to these parts lies Baetiana, wherein is the most excellent Bdellium. The tree that bears it is black, of the bignesse of an Oliue, with leaues like an Oke; and the fruit resembling

A bleth wild figs, and is of the same nature. The gum thereof, some call Brochos; others, Malachra; and there be again that name in Maldacon. Howbeit, when it is blacke, and brought into roses or lumps, they giue it another name, and call it Hadrobolon. But indeede the right Bdellium when it is in the kinde, should be cleare, as yellow as wax, pleasant to smell vnto, in the rubbing and handling fatty, in taste bitter, and nothing soure. Being washed and drenched with wine (as they vse it in sacrifices) it is more odoriferous. There is found of it in Arabia, India, Media, and Babylon. As for that which is brought out of Media, they call it Peraticum: this is more tractable and gentle in hand, more crusty and bitter than the rest. But the Indian Bdellium is the moister and more gummy: this is sophisticated with Almonds, whereas the other kinds be made counterfeite with the bark of Scordastus, a tree that yeelds the like gum. But this trumpery and deceit is found by the smell, colour, weight, taste, and fire. And let this one word for all, serue as a generall rule to proue all such drugs and spices by. The Bactrian Bdellium when it is in the fire, yeeldeth a dry and smoky fume, and hath many white markes in it resembling the nailes of ones fingers: besides, it hath his just poise and weight that it ought to haue, neither more nor lesse; for as it should not be ouer weighty, so it may be too light. Commonly the price goeth after this rate, to wit, three deniers a pound.

Vpon these regions about named, confineth Persis, whereas the red sea (which we named in our Geographic, the Persian gulf) floweth at certain tides far into the land, and in these sands and downes are to be seen diuers trees of strange natures: for when the tide is past, you shall see at a low water some trees with their roots bare, as if they were eaten with the salt water; & a man cannot tell whether they were brought thither with the tide, or left in the ebbe: but surely the naked roots seem to clasp & take hold of the barren sands, as if they were Polype fishes should cling to any thing. And yet the same, when the sea floweth again, notwithstanding they be beaten vpon with the waues, stand fast and stir not. Again, at some high water and spring-tide, they be covered all ouer with water: and by good arguments it is euident to the eye, That nourished they be with the roughnesse of the surging sea-water. Their heights is wonderfull: and fashioned they be in forme of an Arbut tree: the fruit without-forth like to Almonds, but the kernels within be writhed.

CHAP. X.

¶ The Trees of the Island Tylos within the Persian sea. Moreouer of the trees that beare Woolle or Cotton.

W Ithin the same gulf of Persia, there lieth an Isle full of woods to the East side, euen vpon that coast which is ouerflowed with the tide. Euery tree within, is equall in bignesse to the fig-tree: the blossoms that they carry, are so sweet, as it is wonderful & vn-speakable: the fruit like a Lupine, yet so rough & prickly, as no beast will gladly touch it. In the highest part and knap of the same Island, there be trees bearing wooll, but not in such sort as those of the Seres: for whereas the leaues of those do carry a downe or cotton, these are altogether without and barren thereof: and but that they be somewhat lesse, they might seeme to be vine leaues. Howbeit they beare a fruit at the last, like Gourds in fashion, and as bigge as Quinces, which when they be full ripe, do open and shew certain bals within of down: whereof they make most fine and costly linnen clothes.

CHAP. XI.

¶ Of the Gossampine trees: as also of other Cotton or Bombase trees, whereof clothes be made. In what manner diuers trees do yeeld their fruit.

T Here is a lesser Isle named Tylos, ten miles from the other, where be trees called Gossampines, which yeeld more cotton than those in the greater. King Inba saith, that this cotton groweth about the branches of the said trees, and that the linnens made thereof be far better than those of the Indians. As for those trees in Arabia whereof they make their linnen cloth, he affirmeth that they be called Cynæ, and haue leaues like the Date tree. Thus you see, how the Indians be clad with trees of their own. In those Islands called Tyli, there is another tree which beareth a blossome much like the floure of a White Violet, or Cock-gilliflowe, but foure times

as big, which may seeme strange in that tract. And yet there is another Tree not vnlike to it, howbeit fuller of leaues, and bearing a blossome like to a Damask e or incarnate Rose. This floure flutteth close in the night, beginneth to open in the morning at the Sun-rising, and by noone sheweth out at the full. The inhabitants haue a by-word and saying among them, That it sleepest all night, and wakes in the morning. The same Island bringeth forth Date trees, Oliue trees, Vines, and amongst other fruits Figges also. No Trees there, doe shed their leaues: for the Island is well watered with cold and quicke springs: and besides it hath the benefit of raine. As touching Arabia, which lieth neere and bordereth vpon these Islands, the spices and odoriferous fruits that be therein, are to be treated of with distinction: for their merchandise doth consist of roots, branches, barke, juice or liquor, gums and rofins, wood, twigs, floures, leaues and apple.

CHAP. XII.

¶ Of Costus, Spike-nard, and the diuers kinds of Nard.

But the root and leafe be of greatest price in India. And first and formost the root of Costus bites and burns in the mouth, and is of a most excellent and soueraigne smell: for otherwise the branches or body of the shrub is good for little or nothing. In the Island Patale (which lieth at the very first fosse and mouth where the riuer Indus falleth into the sea) there be found two kinds thereof: namely, the black, and the white, which is counted the better. A pound of Costus is held at 16 Roman deniers.

As touching the leafe of Nardus, it were good that we discoursed therof at large, seeing that it is one of the principall ingredients aromaticall that go to the making of most costly & precious ointments. The plant it selfe Nardus, hath a massie, heauy, & thick root; but short, black, and brittle, notwithstanding that it be fatty and oleous. Soone it vinoweth and catcheth a kind of mustinesse: and like to the Cypress[e] or Cyperus, it hath a sharp tast, rough and smal leaues, but comming thick. The head of Nardus spreads into certain spikes or eares, whereby it hath a twofold vse, both of spike and also of leafe, in which regard it is so famous. A second sort there is of it growing along the riuer Ganges, condemned altogether as good for nothing, for it hath a strong and stinking fauor: whereupon it is called Ozanitis. There is an herbe growing euery where called Pseudonardus, or bastard Nard, which is obtruded vnto vs and sold for the true Spikenard. A thicker leafe it hath and a broader than the other: the colour is more pallar and weak, inclining to white. Also the very root of the right Nard, for to make the better weight, is mingled with gums, with Licharge of siluer, Antimony, or the rind of Cyperus. But the good, sincere, & true Nard is known by the lightnes, red colour, sweet smell, and the taste especially: for it drieth the tongue and leaueth a pleasant rellish behind it. The Spike carieth the price of an 100 Roman deniers a pound. As touching the leaues, the diuersitie thereof makes difference also in the price: for that which hath the larger leaues, and therupon is called Hadrosphærum, is worth 30 deniers a pound. A second sort there is with a smaller leafe, and of a middle size, named therefore Mesosphærum: and that is bought after 60 deniers the pound. But the best of all is that with least leaues, and carrieth the name of Microsphærum: and that the merchant selleth for 75 deniers the pound. What kind soeuer it be, the greener and newer it is, the better it is reputed, and more odoriferous, than that which hath been long kept. Yet say it be old gathered, if the colour hold and keepe well, men preferre it before the blacker, though it be new. With vs in Italie, and in this part of the World, the leafe of Nardus comming from Syria, is esteemed best: next to it the Celtick, out of France: and in the third place that of Candy, which some name Agrion, [i. the wild] others Phiu: and this hath a leafe resembling Loueache or Alexanders, a stalke a cubite long full of ioints and knots, of a weake whitish and light purple colour; the root groweth crooked, full of frings and haire hanging to it, and is much like to birds claws or feet. As for Baccharis, it is called likewise Rustick-nard: but of it wil we speak among other floures. Al these kinds of Nardus are to be reckoned herbes, saue that only of the Indians: of which, the Celticke or French Nard, is plucked and gathered together with the root: and for the better preparing thereof, it ought to be well washed and foked in wine, and so dried in the shade out of the Sunne. Then is it made vp into certaine bundels of an handfull apeece, bound vp in papers, and differeth not much in goodnesse from the Indian Spikenard: Howbeit

Abeit, lighter it is than that of Syria. A pound of it is worth at Rome 12 deniers. The only proof and triall of all their leaues is this, That they be not brittle, and rather ripe drie, than sere or rotten-dry, That they breake not and fall in pieces. With the Celticke and French Nard there euermore groweth another herbe, called Hirculus, and it taketh that name of a strong and Goatish smell which it yeeldeth: besides, so like it is vnto the other, that it is foisted in among the good, and so sold with it. Yet herein is the difference; for that this hath no stem or stalke at all; the leaues thereof also are lesse: and last of all, the root is neither bitter in taste, nor sweet in smell.

CHAP. XIII.

¶ Of Asara-Bacca, Amomum, Amomis, and Cardamomum.

Asarum or Fole-foot, called otherwise, Asara-Bacca, hath the very properties and vertues of Nard: and therefore some haue called it Wild Nard. An herbe it is, carrying leaues like to Iuic, saue that they be more round and softer: it putteth forth a purple floure, and hath a root like vnto the French Nard. The floure is full within of seeds like grape kernels, of an hot taste, and resembling wine. In shadowie mountaines it floures twice a yeare. The best groweth in Pontus, the next to it for goodnesse is found in Phrygia: that of Illyricum is of a third ranke. The root is digged vp when it beginneth to put forth leaues. They vse to dry it in the Sun: soon it wil vellow and be mouldy, quickly also it waxes old, and loses the strength. Of late daies there was an herbe found in Thracia, the leaues whereof differ in nothing from the

C Indian Nard.

As for the grape of Amomum, which now is in vse and much occupied, some say it groweth vpon a wilde vine in India. Others haue thought, that it commeth from a shrubbe like Myrtle, & carieth not aboue a hand-bredth, or 4 inches in height. Plucked it is together with the root: and gently must be laid and couched in bunches by handfuls, for if great heed be not taken, it will soone burst and breake. The best Amomum and most commendable, is that which carrieth leaues like to those of the Pomegranate, without riuels and wrinkles, and besides, of a red colour. The next in goodnesse is that which is pale. The greene or grasse coloured is not all out so good, but the worst of all is white: and that colour comes by age, and long keeping: a pound of these grapes intire and whole in the cluster, is worth 60 Roman deniers. But if they be crumbled and broken, it will cost but 48. This Amomum groweth likewise in a part of Armenia named Otene: also, in the kingdomes of Media and Pontus. It is sophisticated with the leaues of the Pomgranate, and with some other liquid gum besides, that it may hang vnited together and roll round into the forme of grapes.

Now as touching that which is called Amomis, it is lesse full of veins, and nothing so sweet smelling, but harder than Amomum: whereby it appeareth, that it is either a diuers plant from it, or els if it be the same, it is gathered before it be full ripe.

Cardamomum is like to these aboue rehearsed, both in name, and also in making and forme: but it bears a longer graine for seed. The maner also of gathering and cutting it downe, in Arabia, is the same. Foure kinds there be of it. The first is most green and fatty withal: hauing foure sharp corners, and if a man rub it between his fingers, he shal find it very tough and stubborne: and this is most esteemed of all the other. The next to it is somewhat reddish, but inclining to a whitish colour. A third sort is shorter, lesse, and blacker than the rest. Howbeit, the worst is that which hath sundry colours, is pliable and gentle in the rubbing, and smelleth but a little. The true Cardamomum ought to come neare in resemblance to Costus. And it grows in Media. A pound of the best will cost 12 deniers.

The great affinitie or kinred rather in name, that Cinnamon hath with these spices before rehearsed, might induce me to write therof in one suite, euen in this place: but that more meet it is to shew first the riches of Arabia, and to set down the causes why that country should be so named Happy and Blessed. Wee will begin therefore with the chiefe commodities thereof, namely, Frankincense and Myrrhe: and yet Myrrhe is found as wel in the Troglodites country, as in Arabia.

THere is no region in the whole world that bringeth forth frankincense but Arabia: and yet is it not to be found in al parts therof, but in that quarter only of the Aramites. Now these Aramites inhabit the very heart of Arabia, and are a countie of the Sabæi. The capitall city of the whole kingdom is called Sabota, seated vpon a high mountain: from whence vnto Saba, the only country that yeelds such plenty of the said incense, it is about 8 daies journey. As for Saba (which in the Greeke tongue signifieth, a secret myserie) it regards the Sunne rising in Summer, or the North-East, enclosed on euery side with rockes inaccessible: and on the right hand it is defended with high cliffes and crags that beare into the sea. The soile of this territorie, by report, is reddish, & inclining to white. The Forrests that carry these Incense trees ly in length 20 Schænes, and beare in bredth half as much. Now that which we call Schænus, according to the calculation of *Eratosthenes*, contains forty stadia, that is to say, fise miles: howsoeuer some haue allowed but 32 stadia to euery Schænus. The quarter wherein these trees grow is full of high hills: howbeit, go down into the plains and valley beneath, you shall haue plenty of the same trees, which come vp of their own accord, and were neuer planted. The earth is fat, and standeth much vpon a strong clay, as all writers do agree. Few Springs are there to be found, and those that be are full of Nitre. There is another tract by it selfe confronting this country, wherein the Minæans do inhabit: and through them there is a narrow passage, whereby the frankincense is transported into other parts. These were their first neighbours that did traffique with them for their Incense, and found a vent for it: and euen so they doe still at this day, whereupon the frankincense it selfe is called of their name, Minzum. Setting these people of the Sabæans aside, there be no Arabians that see an Incense tree from one end of the yere to another: neither are all these permitted to haue a sight of those trees. For the common voice is, that there be not aboue 3000 families which can claime and challenge by right of succession that priuiledge to gather incense. And therefore all the race of them is called Sacred and Holy: for looke when they go about either cutting and flitting the trees, or gathering the Incense, they must not that day come neere a woman to know her carnally; nay they must not be at any funerals, nor approach a dead corps, for being polluted. By which religion and ceremonious obseruation the price is raised, and the incense is the dearer. Some say, these people haue equall liberty in common to go into these Woods for their commodities when they will: but others affirme that they be diuided into companies, and take their turns by yeares. As concerning the very tree I could neuer know yet the perfect description of it. We haue waged warres in Arabia, and our Roman armie haue entred a great way into that country. *C. Cesar* the adopted son of *Augustus* wan great honour and glory from thence: and yet verily, to my knowledge, there was neuer any Latine Author, that hath put down in writing the form and fashion of the tree that carrieth incense. As for the Greeke Writers, their bookes doe vary and differ in that point. Some giue out, that it hath leaues like to a Peare tree, only they be somewhat lesse, and when they come forth they be of a grassie green colour. Others say that they resemble the Lentiske tree, and are somewhat reddish. There be again who write, that it is the very Terebints and none else, that giueth the Frankincense: of which opinion king *Antigonus* was, who had one of these shrubs brought vnto him. King *Iuba* in those bookes which he wrot and sent to *C. Cesar*, son to the Emperor *Augustus*, (who was inflamed with an ardent desire to make a voiage into Arabia, for the great fame that went thereof) saith, That the tree which beares Frankincense hath a trunke or body writen about, and putteth forth boughes and branches like for all the world to the Maple of Pontus. Item, that it yeeldeth a iuice or liquour as doth the Almond tree; and such are seene commonly in Carmania: as also those in Egypt which were planted by the carefull industrie of the *Ptolomees*, Kings there. Howeuer it be, this is receiued for certaine, that it hath the very barke of a Bay tree: Some also haue said that the leaues be as like. And verily such kind of trees were they which were seen at Sardis: for the Kings of Asia likewise were at the cost and labor to transplant them, and desirous to haue them grow in Lydia. The Embassadors who in my time came out of Arabia to Rome, haue made all that was deliuered as touching these trees, more doubtfull and vncertaine than before. A strange matter, and wonderfull indeed, considering that twigges and branches of the Incense tree haue passed betwene:

by

A by the view of which impes, we may judge what the Mother is: namely, euen and round in the bodie, without knot or knar, and from thence she putteth out shoots.

They vse in old time to gather the Incense but once a yere, as hauing little vent, and small returne, and lesse occasion to sell than now adaies: but now, since euery man calleth for it, they feeling the sweetnesse of the gaine, make a double vantage (as it were) of it in one yere. The first, and indeed the kindly season, falls about the hottest daies of the Summer, at what time as the Dog daies begin: for then they cut the Tree where they see the bark to be fullest of liquor, and whereas they perceiue it to be thinnest and strut out most. They make a gash or slit only to giue more libertie: but nothing do they pare or cut cleane away. The wound or incision is no sooner

B made, but out there gusheth a fat some or froth: this soone congeales and growes to be hard: and where the place will giue them leaue, they receiue it in a quilt or mat made of Date tree twigs, plaited and wound one within another wicker-wise. For elsewhere, the floore all about is paved smooth, and rammed downe hard. The former way is the better to gather the purer and clearer Frankincense: but that which falleth vpon the bare ground, prooues the weightier. That which remaines behind, and stickes to the Tree, is parted and scraped off with kniues, or such like yron tooles; and therefore no maruell if it be full of shavings of the bark. The whole wood or Forrest is diuided into certaine portions: and euery man knowes his owne part: nay, there is not one of them will offer wrong vnto another, and encroch vpon his neighbors. They need not to set any keepers to look vnto those Trees that be cut, for no man will rob from his fellow if

C he might; so just and true they be in Arabia. But beleue me, at Alexandria where Frankincense is tried, refined, and made for sale, men cannot look surely ynough to their shops and work-houses, but they will be robbed. The workman that is employed about it, is all naked, saue that he hath a paire of trouses or breeches to couer his shame, and those are sowed vp and sealed too, for feare of thrusting any into them. Hood-winked he is sure ynough for seeing the way to and fro, and hath a thicke coife or maske about his head, for doubt that he should bestow any in mouth or eares. And when these workmen be let forth againe, they be stripped starke naked, as euer they were borne, and sent away. Whereby we may see, that the rigor of justice cannot strike so great feare into our theecues here, and make vs so secure to keepe our owne, as among the

D Sabæans, the bare reuerence and religion of those woods. But to returne againe to our former cuts. That Incense which was let out in Summer, they leaue there vnder the Tree vntil the Autumne, and then they come and gather it. And this is most pure, cleane, and white.

A second Vantage and gathering there is in the Spring: against which time, they cut the bark before in the Winter, and suffer it to run out vntil the Spring. This comes forth red, and is nothing comparable to the former. The better is called Carpheotum, the worse, Dathiathum. Moreover, some say, that the gum which issueth out of the young trees is the whiter: but that which comes from the old, is more odoriferous. There be others also of opinion, that the better Incense is in the Islands. But King *Iuba* doth auouch constantly, that there is none at all in the Islands. That which is round like vnto a drop, and so hangeth, we call the male Incense; whereas

E in other things lightly we name the male, but where there is a female. But folk haue a religious ceremonie in it, not to vse so much as the tearme of the other sexe, in giuing denomination to Frankincense. Howbeit, some say, that it was called the Male, for a resemblance that it hath to cullions or stones. In very truth, that is held for the cheife and best simply, which is fashioned like to the nipples or teats that giue milk, standing thick one by another: to wit, when the former drop that distilled, hath another presently followeth after, and so consequently more vnto them, and they all seeme to hang together like bigs. I read, that euery one of these were wont to make a good handfull, namely, when men were not so hasty & eager to carry it away, but would

F giue it time and leisure to drop softly. When it is gathered in this sort, the Greeks vse to call it Stagonias and Atomus: but the lesser goblets they name Orobias. As for the small cruims or fragments which fall off by shaking, wee called Manna, [*i. Thuria*.] And yet there be found at this day drops of Incense that weigh the third part of a pound, that is to say, about * 39 Romani deniers. It happened on a time, that king *Alexander* the Great being then but a very little child, made no spare of Incense, but cast still vpon the altar without all measure when he offered sacrifice. Whereupon, *Leonides* his tutor and schoole-master, by way of a light reproofe, said vnto him thus, Sir you should in that maner burne Incense when you haue once conquered those nations where there growes Incense. Which rebuke and checke of his tooke so deep a print in

Alexander's

or rather 39
and a scrupulo.

Alexanders heart, and so well he carried it in memorie, that after he had indeede made conquest of Arabia, he sent vnto the said *Leonides* his Tutor, a ship full fraught and charged with Incense, willing him not to spare, but liberally to bestow vpon the gods when hee sacrificed. To returne againe to our historie. When the Incense is gathered (as is before said) conueighed it is to Sabota, vpon Cammels backs, and at one gate (set open for that purpose) is it brought into the citie. For by law forbidden it is on pain of death, to take any other way. Which done, the Priests there of the god whom they call *Sabis*, take the disme or tenth part of the Incense, by measure, and not by weight, and set it apart for that god. Neither is it lawful for any man to buy or sell, before that duty be paid: which serueth afterwards to support certaine publick expenses of the citie. For al strangers and traueilers within the compasse of certain daies journey, if they come to the citie, are courteously receiued, and liberally entertained at the cost and charge of the said god *Sabis*. Caried forth of the country it cannot be, but thorough the Gebanites: and therefore there is a custome paid to their king. The head citie of that kingdome, *Thomna*, is from *Gaza* (the next port-towne in Iudæa toward our coast) seuen and twentie miles fourscore times told: and this way is diuided into 62 daies journey by Camels. Moreouer, besides the tyth aforesaid, there be measures bestowed vpon the Priests to their owne vse: and others likewise to the kings Secretaries and Scribes. And not only these haue a share, but also the Keepers, Sextons, and Wardens of the temple, the Squires of the bodie, the Guard and Pensioners, the kings officers, the Porters, Groomes, and other seruitors pill and poll, and euery one hath a snatch. Moreouer, all the way as they trauell; in one place they pay for their water, in another for fodder and prouender, or else for their lodging & stable-room, & euery where for one thing or other they pay toll: so as the charge of euery Camell from thence to the sea vpon our coast, commeth to 688 deniers: and yet we are not come to an end of payments. For our Publicanes and customers also belonging to our Empire, must haue a fleece for their parts. And therefore a pound of the best Incense will cost 16 deniers: of the second 15: and the third 14. With vs it is mingled and sophisticated with parcels of a white kind of Rosin which is very like to it: but the fraud is soone found, by the meanes aboue specified. The best Incense is tried and knowne by these markes, *viz.* If it be white, large, brittle, and easie to take a flame when it comes neare a coale of fire; last of all, if it still not abide the dent of the tooth, but flie in pieces and crumble sooner than suffer the teeth to enter into it.

CHAP. XV.

¶ Of Myrrhe, and the Trees that yeeld it.

Some haue written, That the Trees which beare the Myrrhe, doe grow confusedly here and there in the same woods, among the Incense Trees: but more there are who affirme, That they grow apart by themselves. And in truth, found they are in many quarters of Arabia, as shall be said when we treat of the seuerall species of Myrrh. There is very good Myrrh brought out of the Islands: and the Sabæns passe ahe seas, and trauell as far as to the Troglodites country for it. There is a kind of Myrrhe tree planted by mans hand in Hort-yards, and much preferred it is before the wild that groweth in the woods. These Trees loue to be raked, bared, and cleansed about the roots: they delight (I say) to haue the superfluous spurnes rid away from the root: and the more that the root is cooled, the better thriue the Tree. The plant groweth ordinarily fise cubits high, but not all that length is smooth and without pricks: the bodie and trunke is hard and wrythen, thicker than the Incense trees: it is greatest toward the root: and so arifes smaller and smaller, taperwise. Some say, that the bark is smooth and euen, like vnto that of the Arbut Tree: others againe affirme, that it is prickly and full of thornes. It hath a leafe like to the Olive, cut more crisped and curled, and withall it is in the end sharp-pointed like a needle. But King *Iuba* writes, that it beareth the leafe of Loueach or Alifanders. There be who write, that it resembles the Iuniper, saue only that it is more rough and beset with sharp pricks. And some let not to dream & talke, that both Myrrhe and also Incense came from one and the same Tree. Indeed, the Myrrhe trees are twice cut and launced in one yeare, and at the same seasons, as well as the Incense trees: but the slit reacheth from the very root vp to the boughes, if they may beare and abide it. Howbeit, before that incision be made, they sweat out of themselves a certain liquor called *Stacte*, which is very good Myrrh, and none better. As wel of this franke

A franke and garden myrrh tree, as of the wild in the woods, the Myrrh is better that is gathered or runs in Summer time. There is no allowance of myrrh offered and giuen to the god *Sabis*, as there was of Incense, because it is found in other countries. Howbeit the King of the Gebanites hath payed vnto him for toll and custome a fourth part of all that passeth through his kingdome. To conclude, whatsoeuer is bought in any market or place abroad, they put and thrust it hard together in leather bags one with another: but the Druggists and Apothecaries can soon separate the better from the worse, and be very cunning and ready to digest them according to the marks that they go by, as well of smell as fattinesse.

CHAP. XVI.

¶ Diners kinds of Myrrhe: the nature, vertue, and price thereof.

B Many sorts there be of Myrrh. Of all the wild kinds, the first is that which groweth in the Troglodites country. Next to it is *Minæa*, in which rank you may place *Attramittica* and *Aufaritis*, which both come out of the realme of the Gebanites. In a third place reckon that which they call *Dianitis*. A fourth sort is gotten here and there in all parts, and huddled together. In the first range is *Sembracena*, so called of a city within the kingdom of the Sabæans, and is next vnto the sea. The sixth they call *Dufaritis*. Besides all these, a white myrrh there is found but in one place, which ordinarily is brought to the city *Mesalum*, & there sold. The Trogloditick myrrh they chuse by the fattinesse thereof, and for that it seemes to the eye greener: it shewes also soule, rude, and ilfaoured: but sharper it is, and more biting in mouth than the rest. The *Sembracene* hath none of these faults, but is pleasant and cheereful to see to, howbeit of small operation and strength. But to speake in a word, and once for all, the best myrrh is known by little pieces which are not round: and when they grow together, they yeeld a certain whitish liquor which issueth and resolueth from them, and if a man break them into morsels, it hath white veines resembling mens nailes, and in taste is somewhat bitter. A second degree there is in goodnes, when it sheweth sundry colors within. And the worst of all is that which within-forth is black; and the same is worse yet, if it be as black without. As touching the price of myrrh, it alters as it is more or lesse in request, and according as it meeteth with many or few chapmen. For ye shall haue *Stacte* sold sometimes for 6 deniers a pound, and otherwhiles for 50. The greatest price of the garden frank-Myrrh, or that which is let by mans hand is 22 deniers. The red called *Erythrea* is neuer aboue 16: and this is taken to be the true myrrh of Arabia. The kernell within of the Trogloditick Myrrh will cost 13 deniers a pound: but that which they call * *Odoraria* is sold for 14. All kinds of Myrrh being mingled and sophisticated with pieces of Masticke comming from the Lentiske, and with other gum: *Item* with *Elaterium* [i. the iuice of the wild cucumber] to make it more bitter: as also, that it might seem weightier, with the some of lead, or litharge of siluer. And surely setting aside these two corruptions, all the rest are found by the very tast of the gum, which also will sticke vnto the teeth in the chewing. But the craftiest and finest deuice to counterfeit it, is with Indian myrrh, gathered there from a certain thorny plant which growes among them. This is the onely thing that India bringeth forth worse than other countries. And verily so bad it is, that soone it may be knowne from other myrrhes.

CHAP. XVII.

¶ Of Mastick, Ladanium, and Bruta of Enhemus, Strobilus, and Syrax.

F From the foresaid Myrrh therefore last named, let vs for the affinitie passe to Mastick: which comes also of another thorny tree in India, as also in Arabia, called *Lama*. Howbeit of Mastick there be two sorts: for both in Asia and also in Greece there is found an hearbe, which directly from the root putteth forth leaues, and it beareth a bur or thistle head like an apple, full of seeds. Cut the top of this herbe, and there will issue forth a certain liquor so like vnto the right mastick, that hardly a man shall know the one from the other.ouer and besides, there is a third sort of Masticke in Pontus, more like to Bitumen. Howbeit, the very best Mastick is brought out of the Island *Chios*, and the same is white, and a pound of it is worth in Rome 20 deniers: but the black ye shall buy for twelue. As for the Chian Masticke, it issueth forth

forth as a gum out of the Lentisk tree. Mingled this is also like as frankincense, with rosin.

Moreover, Arabia doth glory even yet in their Ladanum. And many haue reported, that this comes by fortune or chance, and by occasion of violence and wrong done to an odoriferous plant that yeeldeth it in this manner following: The Goats they say, harmefull creatures as they be to all plants, but more desirous to be broufing of sweet and aromaticall shrubs (as if they knew how precious they were) vse to crop the sprouts and sprigs of this plant which beareth Masticke; which being so full of this odoriferous and sweet liquor, that they smel again, dorth drop and distill the said moisture, which the shrewd and vnhappy beast catcheth among the shag long haire of his beard. Now by reason that dust getteth among, it baltereth & clut-
tereth into knots and balls, and so is concocted into a certaine consistence in the Sunne. And hereupon it is, that in Ladanum are found goats haire. But this hapneth by their saying, in no other place but among the Nabateans in the frontiers of Arabia toward Syria. The later moderne writers call the plant which yeeldeth Ladanum, Strobos: and they affirme, That in the forestts of Arabia where these do grow, the boughes are much broken by the broufing of these goats, and so the iuice and liquor stickes to their locks and beards. But the true Ladanum (say they) is peculiar to the Island Cyprus (for, giue me leaue I pray you, to speake by the way of euery kind of spice and aromaticall drugs, & not strictly to keep & obserue the order & consequence of places where they be found.) And by report, after the same manner as this Ladanum in Arabia, there hangeth and cleaueth to the beards and shagge haired legs and flanks of the goats there also, a certain grease and fattinesse called Oesypus: but, according to them, it must be gotten when they crop off the leaues and floures of the herbe Cistus, in a morning for their breakefast, at what time as the Island Cyprus standeth all with a dew. Now when the morning mist is dispatched by the heat of the Sunne, there gathereth dust amongst these moist and wet haire of theirs, and sticketh to: and then the Islanders come and comb from their beards and flanks that which the call Ladanum. Some call that plant in Cyprus whereof it is made, Ledon: and in truth thereof it taketh the name of Ledanum amongst them. For by their report, this herbe hath a fatty substance feeling vpon it, and the peasants of the countrey roll the herbs together into balls or rundles, with small cords, and so make vp those little lumpes ye see. By which we may perceiue, that as well in Arabia as Cyprus there be two kinds of Ladanum: the one mixed with earth, and naturall of it selfe: the other brought into balls and artificiall. The earthy is brittle and will crumble: the artificiall is tough, clammy, and will cleaue to ones fingers. Moreover, it is said that there be certain shrubs in Carmania that beare Ladanum, as also about Egypt, by occasion of plants thither brought by the *Ptolomes*, kings of Egypt: or as some say it is the Incense tree that bringeth it forth: and is gathered after the manner of a gum issuing out of the tree by incision made in the barked, and is receiued in goat skins. The best Ladanum is worth forty Asses a pound. Sophisticated it is with Myrtle berries, and with other filth of beasts. The good Ladanum indeed, which is of it selfe without other mixture, ought to haue a wild and sauage smell with it, as if it came out of a wildernesse. Greenish it is, and drie to see to: but handle it neuer so little, and presently it dorth relent and wax soft. Set it on fire, and it burneth bright and cleare, and then it cast a sweet and pleasant odour. But all that is counterfeit and mixed with myrtle berries may soon be knowne, for they will crackle in the fire. Besides, the true Ladanum hath rather stony grit comming from the rockes, mingled with it, than dust.

In Arabia, the Oliue tree also hath a kind of liquour which issueth out of it: and thereof is compounded a certain soueraign salue named of the Greeks Enhemon, which is singular good to draw vp wounds and heale them clean. In the maritime parts and sea coasts the said Oliue trees at some tides are ouerflowed with the waues. Yet receiue the Oliue berries no hurt thereby: notwithstanding it be certain, that the sea dorth leaue salt vpon the leaues. Thus you see what be the peculiar commodities as touching trees, proper vnto Arabia. True it is that it hath others besides, but because they be found elsewhere, and knowne to be better in other places than in Arabia, I will treat of them in their course and ranke when it commeth. And yet Arabia it selfe, as fruitfull and happy as it is in this behalfe, is wondrous eager in seeking after forreine spices, and sendeth for them into strange countries. So soone are men gluttied and haue their fill of their owne: and so greedy and desirous be they of other countries commodities.

They

A They send therefore as far as the Helymæans, for a tree named Bruta, like to a spreading cypress, hauing boughes couered with a whitish bark, casting a pleasant smelling perfume when it burneth, and highly commended in the chronicles and historie of *Claudius Caesar* for strange vertues and wonderfull properties. For he writeth, That the Parthians vse to put the leaues thereof in their drinke, for to giue it a good tast and odoriferous smell. The odour thereof resembleth the Cedar very much: and the perfume is a singular remedie against the stinking and noisome fumes of other wood. It groweth beyond the great channell of the riuer Tigris, called Pasitigris, vpon the mount Zagrus neare vnto the citie Citaca.

They send moreover to the Carmanians for another tree called Strobos, and all to make sweet perfumes: but first they infuse the wood thereof in Dare-wine, and then burn it. This is an excellent perfume: for it wil fill the whole house, rising vp to the chambers aloft to the arched feelings of the rouse, and returning downe againe to the very floore and ground beneath, most pleasantly. But it stuifes a mans head, howbeit without any paine or ach at all. With this perfume they procure sleep to sick persons. And for the traffick of this commodity, the merchants meet at the citie Carras, where they keep an ordinarie faire or mart: and from thence they went customably to Gabba, twentie daies journey off, where they were wont to haue a vent for their merchandise, and to make returne: and so forward into Palestine of Syria. But afterwards (as *K. Iuba* saith) they began to go to Charace, and to the kingdom of the Parthians, for the same purpose. For mine owne part, I thinke rather with *Herodotus*, That the Arabians transported these odours and spices to the Persians first, before that they went therewith either into Syria or Ægypt: and I ground vpon the testimonie of *Herodotus*, who affirmeth, That the Arabians paid euery yeare vnto the KK. of Persia the weight of a talent in Frankincense, for tribute.

C Out of Syria they bring back Storax, with the acrimonie and hot smell wherof, being burnt vpon their hearths, they put by and driue away the loathfomnesse of their own odors, wherewith they are cloyed: for the Arabians vse no other fuell at all for their fires, but sweet wood. As for the Sabæans, they seeth their meats in the kitchin, somewith the wood of the Incense tree, and others with that of Myrrhe: insomuch as both in citie and country their houses be full of the smoke and smell thereof, as if it came from the sacrifice vpon the altars. For to qualifie therefore this ordinarie sent of Myrrhe and Frankincense wherewith they are stuffed, they perfume their houses with Storax, which they burne in Goats skins. Loe, how there is no pleasure whatsoever but breeds lothfomnesse, if a man continue long to it. The same Storax they vse to burne for the chasing away of Serpents, which in those forestts of sweet trees, are most rife & common.

CHAP. XVIII.

¶ Of the felicitie of Arabia.

N Neither Cinamon nor Casia do grow in Arabia, and yet is it named Happie: vnworthie country as it is, for that surname, in that it taketh it selfe beholden to the gods aboue therefore, whereas indeed they haue greater cause to thanke the infernal spirits beneath. For what hath made Arabia blessed, rich, and happie, but the superfluous expence that men be at, in funerals, employing those sweet odors to burne the bodies of the dead, which they knew by good right were due vnto the gods. And verily it is constantly affirmed by them who are acquainted well with the world, and know what belongeth to these matters, That there commeth not so much Incense of one whole yeares increase in Saba, as the Emperor *Nero* spent in one day, when he burnt the corps of his wife *Poppea*. Cast then, how many funerals euery yeare after were made throughout the world: what heaps of odors haue been bestowed in the honor of dead bodies: whereas they offer vnto the gods by crums and graines only. And yet when as men made supplication to them with the oblation of a little cake made with salt, and meale, and no more; they were no lesse propitious and merciful, nay they were more gracious and fauourable a great deale, as may appeare by histories. But to returne againe to Arabia, the sea enricheth it more than the land, by occasion of the orient pearles that it yeeldeth and sendeth vnto vs. And surely our pleasures, our delights, and our women together, are so costly vnto vs, that there is not a daye goeth ouer our heads, but what in pearles, perfumes, and silkes; India, the Seres, and that demy-Island of Arabia, stands vs at the least in an hundred millions of Sesterces, and so much fetch they from vs in good money, within the compasse of our Empire. But of all this masse of

Spice

Spice and Odors, how much (I pray you) commeth to the seruice of the coelestiall gods, in comparison of that which is burnt at funerals, to the spirits infernall;

CHAP. XIX.

¶ Of Cinamon, and the wood thereof called *Xylocinnamomum*.
Also of Canell or Casia.

FAbulous antiquitie, and the prince of lyers *Herodotus*, haue reported, That in that tract where *Bacchus* was nourished, Cinamon and Canell either fell from the nests of certaine fowles, and principally of the Phoenix, thorough the weight of the venison and flesh which they had preyed vpon and brought thither whereas they builded in high rockes and trees; or else was driuen and beaten downe, by arrowes headed with lead. Also that Canell or Casia was gotten from about certaine marshes, guarded and kept with a kind of cruell Bats, armed with terrible and dreadfull tallons, and with certain flying Pen-drasons. And all these deuises were inuented only to enhance the price of these drugs. And this tale is told another way, namely, That in those parts where Canell and Cinamon grow (which is a country in manner of demy-Island, much enuironed with the sea) by the reflection of the beames of the Noon-sun, a world of odoriferous smells is cast from thence, in such sort, that a man may feele the sent at one time of all the aromaticall drugs as it were met together, and sending a most fragrant and pleasant fauour far and neare: and that *Alexander the Great* sailing with his fleet, by the very smell alone discovered Arabia a great way into the maine sea. Lies all, both the one and the other: for Cinamome or Cinamon, call it whether you will, groweth in *Aethiopia*, a countrey neare vnto the *Troglodites*, who by mutuall marriages are linked together in great affinity. And in very truth the *Aethiopians* buy vp all the Cinamon they can of their neighbours, and transport it into other strange countries ouer the vast Ocean, in smal punts or boats, neither ruled with helme and rudder, nor directed to and fro with ores, ne yet caried with sailes or any such meanes of navigation: one man alone shall see you there in a boat, armed and furnished with boldnesse only in stead of all, to hafard himself and his goods in the surging sea. These fellows, of all times of the yeare, take the dead of the winter, and then (to chuse) they will venter to crosse the seas for their voyage, when the Southeast winds are aloft & blow lustily. These winds set them forward in a freight and dire & course thorough the gulfes; and after they haue doubled the point of *Argeste*, and coasted along, bring them into the famous port or hauen-towne of the *Gebanites*, called *Ocila*. And albeit this voiage be long & dangerous (for the merchants hardly can return in five yerres, and many of them miscarie by the way) yet by report they are nothing dismayed and daunted therewith, but willingly aduenture still. And being at *Ocila*, what thinke you doe they exchange for, and wherewith freight they their vessels back againe homeward? euen with glasse, vessels of copper and brasse, fine cloth, buckles, claspes, and pincers, bracelets and carcanets, with pendant jewels: so as a man would verily thinke, that this trafficke were maintained and the voiaiges enterprised vnder the credit & for the pleasure of womankind especially. Now as touching the plant that bears Cinamon, the tallest is not aboue 2 cubits high aboue ground, nor the lowest vnder one hand-breadth or 4 inches: in compasse about 4 fingers thicke: immediately from the earth it putteth forth twigs, and is full of branches of six fingers length, but it looketh as if it were drie and withered: whiles it is greene it yeelds no smell at all, and the leaf resembleth *Origan*: it loues drought, for in rainie weather it is lesse fruitfull, and yet it is of this nature, To be cut as a coppis. It will grow verily in plaines, but gladly it would lodge among the thickest rough of bushes, greeues, & briars that are to be found: so as men haue much adoe to come by it and to gather it: but neuer is cut or cropped without especiall permission of a certaine god, which they take to be *Iupiter*; and this patron of the Cinamon tree, they call *Assabinus*. To obtaine leaue and license so to do, they are glad to sacrifice the inwards of 44 Kine or Oxen, Goats also and Rams: and when they haue all done, yet permitted they be not to go about this businesse either before the Sun rising, or after his setting. Now when these twigs and branches be cut, the Sacrificer or Priest diuides and parts them with a iauelin, and sets by one portion for the god abovesaid: the rest doth the merchant put vp and bestow in paniers for the purpose. This manner of diuision is otherwise reported; namely, That the whole heap is cast into three parts, whereof the sunne hath one for his share: but they draw lots first for euery one

A one of these trees seueral bundles or parcels of Cinamon sticks; and that which falleth to the Sun is let alone and left behind: but of the own accord it catcheth a light fire and burneth. The best Cinamon is thought to be that which growes about the slenderest sticks, for the length of an hand bredth from the vpper end. The second sort in goodnesse is that which is next it, and somewhat lower, but it beareth not full so much as an hand bredth; and so consequently in order by degrees downward; for the worst and of least price is that which is neere the root, because there is least barke, the chiefe thing required in Cinamon: which is the cause that the twigs in the tree top are preferred before the rest, for that in them there is most barke. As for the very wood it selfe, which is called *Xylocinnamomum*, there is no reckoning made of it, because of the acrimonie and sharpenesse that it hath, resembling *Origan*. A pound thereof is worth 20 deniers. Of Cinamon there be (according to some) two kinds; to wit, the whiter and the blacker. In times past, the white was in more request: but now adaies the black is most seck by: yea, and that of diuers colours is better esteemed than the white. But the truest marke indeed to chuse the best, is to see that it be not tough, and that it crumble not quickly if one piece be rubbed against another. That which is tender and hath besides a white bark, is not regarded at all, but condemned for the worst. Moreouer, this is to be noted, that the King onely of the *Gebanites* setteth the price and sale of Cinamon: he it is that selleth it in open market according as it is by him taxed. In old time a pound of it was sold for 1000 deniers, and this price afterward rose higher by one halfe, by reason that the Forrests of Cinamon were (as men say) burnt by the barbarous *Troglodites* their neighbors in their furious wrath. Now why it should be so deare, no man certainly knows: whether it were through the great rich merchants who ingrossed all into their hands by way of monopoly, or by some other casualtie and chance of fire aforesaid. But true it is and well knowne by that we find in diuers writers, That there be such hot Southerne windes blowing in those parts, that in Summer many times they set the woods on fire. *Vespasian Augustus* the Emperor was the first that dedicated in the Temples of the Capitol and goddesse *Peace*, garlands and chaplets of Cinamon enclosed within fine polished gold. In that temple which the Empreffe *Augusta* caused to be built in the palace vpon Mount *Palatine*, for the honor of *Augustus Caesar* late Emperor, her husband, I haue myself seen a Cinamon root of great weight, set in a cup of gold, which yearely did put forth certain drops which congealed into hard grains. That monument remained there to be seen, vntill the Temple and all was consumed by fire.

E As concerning Casia or Canell, a plant it is, which groweth neer to the plains from whence the Cinamon comes; but it loveth to liue vpon mountaines, and beareth a bigger and rounder wood in the branches than the Cinamon, and hath a thin rinde or skin, more truly than a bark: the slenderer that the same is, and lighter, the more reckoning is made of it; clean contrary to the Cinamon. This shrub that beareth Casia groweth to the height of 3 cubits: and 3 colours it carieth; for when it comes vp first, for a foot from the root it is white: then as it shooteth halfe a foot higher it waxeth red: but as it riseth farther it is blackish: and this part is held for the best; and so the next to it in a degree lower: but the white is of no regard at all, and therefore they neuer cut the twigs and branches neere the root, nor aboue two cubits in length. And when they haue cut them in this manner, they presently sow them vp in greene skinned of four-footed beasts, killed new and fresh for that purpose, that of their corruption and putrefaction there might breed certaine wormes to eat out the wood within the barke, and so make it hollow; for the bark is so bitter that the worm will not touch it. The newest and freshest Canell is reputed best, and that which hath a most delicate smell; very hot in the mouth, and burning the tongue, rather than gently warming it without any great biting. Such Canell is of a purple colour, and very light in hand; which seeming much to the eye, yet weigheth little: besides, the pipes be but short, and the outward rinde or coat is not brittle and easie to fall in pieces. This elect and choise Canell the barbarous people call *Lacta*. Another sort there is named *Balsamodes*, because it hath a smell resembling Balm: bitter it is in the mouth, & therefore of more vse in physicke; like as the blacke is most employed in sweet perfumes and oynments. There is no drugs that varieth more in price than the Canell: for whereas the best will cost fifty deniers Romana pound; all the rest a man may buy for five.

C H A P. XX.

¶ Of *Isocinnamon, Cancamum, and Tarum.*

THe Hucksters and regraters that buy and sell againe haue another kinde, which they call Daphnoides, and they syrname it Iso-cinnamon: and surely they hold it at 300 deniers a pound. Mingled it is and made counterfeited with Storax, with the smallest and tendrest branches also of Lawrell, for the likenesse it hath to the bark therof. Moreover, it is set & planted in our part of the world here in Italy, also in the vtmost marches and confines of our Empire, along where the riuer Rhine runs, it liueth, being set neere vnto Bee-hiues. Howbeit, because it wants the parching heate of the Sun, it is nothing so deepe coloured; and thereupon also it comes short of the smell that the other hath. Out of the regions which bound on those parts where Casia and Cinamon groweth, there are brought ouer vnto vs two other spices, called Cancamum and Tarum: but by the way of the Troglodite Nabathæans, who onely of the antient Nabathæans there settled and remained,

C H A P. XXI.

¶ Of *Serichatum, Gabalium, and Myrobalanum, [i. Ben.]*

IN the same country, the Arabians come charged also with Serichatum and Gabalium: but they make an hand with it among themselves, and spend it quite: in such sort, as their drugs are known only in name to vs in this part of the world, albeit they grow together with Cinamon and Casia. And yet otherwhiles there is Serichatum brought vnto vs, which some perfumers vse to put into the composition of ointments. And a pound of it is commonly exchanged for six deniers.

As for Myrobalanum, [*i. Behen*] it growes ordinarily in the region of the Troglodites, about Thebais, and that part of Arabia which diuideth Iury from Egypt: a drug that Nature hath brought forth only for ointment, as the very name giueth it. Whereby it appeareth also, that it is a very nut of a certain tree, which beareth leaues like to Heliotropium: whereof we wil speake among other herbs. The fruit that this plant beareth is about the bignes of a filberd nut. That which growes in Arabia, and yet called Syriaca, is white: but contrariwise that about Thebais is black. The former of these two is commended for the goodnesse of the oile which is pressed out of it: but the Thebaick Ben is in greater request for the plenty that it yeeldeth. As for the Trogloditick, it is the worst of all, and the cheapest. And yet some there be that prefer the Æthiopian Ben before all other. The Nut and fruit thereof is black and fat, with a smal and slender kernell within: howbeit the liquor pressed forth of it is more odoriferous: and it groweth in champian countries and plains. It is affirmed moreover, that the Egyptian Ben is more oleous and fat, hauing a thicker shell, and the same red. And albeit that it grow in marsh ground, yet is it a shorter plant and more dry than the others. But contrariwise they say, that the Arabick is green of colour, and thinner in substance: and for that it groweth vpon the mountaines it is more massie and weighty. But the best simply by many degrees, is that Ben which is called Petrea, coming from about the town abouesaid; with a blackish rind, & white kernel. Now the Perfumers and Apothecaries, do presse only the husks and shells, but the Physitians extract an oile out of the very kernels, which as they stamp, they poure hot water euer and anon vnto it, by little and little.

C H A P. XXII.

¶ Of *Phenicobalanus, Calamus odoratus, and Squinanth.*

THe Date in Egypt called Adipsos hath the like vse in ointments, and is next in request for such odoriferous compositions, as the Myrobalanus, or Ben aforesaid. Green it is in colour, it smelleth like vnto a Quince, and hath no woody stone within. But to serue for those purposes aboue recited, it must be gathered somewhat before it beginneth to ripen. That which is left behinde vngathered is called Phenicobalanus. This waxeth blacke, and maketh them drunke that eat thereof. As for Myrobalanus, or Ben, it is worth two Romane deniers a pound.

A pound. The occupiers and shopkeepers call the very setting and grounds of their ointment and compositions, by the name of Myrobalanon.

Moreover, within Arabia there growes also the sweet Calamus, which is common to the Indians & Syrians likewise. That of Syria passes all the rest, and comes vp in a tract of that countrey, distant from the coast of our Sea fiftie stadia. Between mount Libanon, and another mountain of no account [for it is not Antilibanon as some haue thought] in a little vale beneath neer vnto a lake, the marshes and flats whereof are drie in Summer for the space of thirtie stadia, there grow both sweet Calamus, and also Squinanth or Iuncus Odoratus, [*i. the Sweet-rush.*] For let vs speake also in this place of the said Scænanth: and although it be but a rush, and another booke is appointed for the treatise and historie of such Hearbes, yet because we handle the Species that go to the composition of sweet Perfumes, Pomanders, & ointments, I cannot passe it ouer. Well then, neither the one nor the other of these twaine, differ in sight from the rest of that kind. But Calamus is the better of the twaine, and hath a more pleasant smell; for a man may wind the sent of it presently a great way off: besides, it is softer in hand: and better is that which is lesse brittle, and breaketh in long spils and shiuers, rather than knappeth off like a Radish root. Within the pipe of this reed, there lieth a certaine matter like vnto a Spiders-web, which the Apothecaries call the flower of it, and that Calamus is counted better, which hath more in it of these floures. There is another mark also of good Calamus, namely, if it be black: and yet in some place, they make no reckoning of the blacke Calamus. But in a word, the shorter and thicker that the reed is, the better is the Calamus: and the same is more supple and pliable when a man would breake it. As for Calamus, it is worth eleuen deniers the pound: but Squinanth is sold for fifteen. Moreover, some say that there is a sweet rush or Squinanth found in Campania. And now are we gone from those lands that coast vpon the deep ocean, and come to those that confront and lie vpon our Mediterranean seas.

C H A P. XXIII.

¶ Of *Hammoniacum, and Spagnum.*

TO begin withall, in the sands of those parts of Affrick, which lie vnder Æthiopia, there is a liquor distilled, called in Greeke *Hammoniacum*, of *Hammon*, which signifieth Sand, and the Oracle of *Iupiter Hammon*, for neare vnto the temple where the said Oracle returnes Answers, there grow certaine trees within the sands, which they call Metopia, from which, *Hammoniacum* droppeth in manner of a rosin or gum: and of it there be two kinds: the one is named Thrauston, like vnto the male or better Frankincense, and is most esteemed: the other is fat and full of rosin, and they call it Phyrana. The manner to sophisticate *Hammoniacum*, is with sand, to make men beleue that it grew among the sands, and gathered it in the growing and coming vp: and therefore the good *Ammoniacum* is known when it is in least morcels, and those very cleare. The price of the best is after fortie asses the pound.

Beneath these quarters, and within the prouince Cyrenaica, there is found a passing sweet Mosse, called *Sphagnos*; and of some Bryon [*aromaticum*]. Of all such Mosses, this is thought to be the best. Next vnto it, is that of Cyprus: and in a third ranke, the mosse which groweth in Phoenicia. There is such Mosse (by report) in Egypt, and likewise in France: whereof, for my part, I make no doubt: for they be nothing else but the grey and whitish haire that we see hang to trees, and about the oke especially, called commonly Mosse; but only that these be sweet and odoriferous. The cheife praise is of the whitest and lightest: a second commendation belongs to that which is red: but the blacke is worth nothing, neither is any reckoning made of that which groweth in Islands and rockes, and (to conclude) all those that smell not as Mosse should, but rather like to Dates, or the plants whereof they come.

C H A P. XXIII.

¶ Of *Cyprus, Aspalathus, and Marum.*

THere is a tree in Ægypt called *Cyprus*, bearing leaues like to *Ziziphus* or the *Iube* tree, and a grain resembling *Coriander* seed, with a white floure very pleasant and sweet. These floures be steeped and sodde in common oile: out of which is afterwards pressed medi-

cinable oile called Cyprus, or Cyprinum. A pound of it will cost five Roman deniers. The best comes from that tree which growes vpon the bankes of that riuer Nilus about Canopus, which is the first mouth where it discharges it selfe into the sea. The second in goodnesse groweth about Ascalon a citie of Iudæa. The third in worth for smell and sweetnes, is had from the Isle Cyprus. Some take this Cyprus to be the plant, which in Italy is called Ligustrum. [i. Priuet.]

In the same tract groweth Aspalathus: a white thornie shrub it is, of the bignesse of a small tree, and beareth a floure resembling a rose. The root of it is in request for the making of sweet perfumes and ointments. There goes a common speech, That euery plant ouer which the rainbow is seen bent, will cast the same sent that Aspalathus doth: but if it chance that the rainbow settle ouer Aspalathus, then it wil yeeld a sweet sauer incomparable, and such as cannot be expressed. Some call it Erysceptrum, others Sceptum, simply. The good Aspalathus is red, or rather of a fierie colour, massie and heauie in hand, with a smell of Castoreum. It is sold for fiftene deniers the pound.

In Ægypt likewise there groweth Marum, but it is not so good as that of Lydia; for it hath greater leaues, and those spotted with sundry colours; whereas the other hath little short leaues, but they smell passing sweet.

CHAP. XXV.

¶ Of Baulme, as well the liquor thereof called Opobalsamum, as the wood named Xylobalsamum. Also of Storax [Calamita] and Galbanum.

BVt the Baulme is that sweet and odoriferous liquor that goes beyond all others. The tree that yeelds it, Nature hath bestowed only vpon the land of Iurie. In old time it was not to be found but in two parkes or hortyards, belonging both to the kings of Iurie, whereof the one contained not about twentie jugera or acres, the other not so much. The Emperors *Vespasians*, both father and son, brought one of those little Balm trees to Rome, and shewed it openly to the whole citie. *Pompey* the Great likewise made proud boast and vaunted much, when hee said, That trees also by him were borne in triumph. Now this Balm tree serueth and doth homage, yea is tributarie with the whole nation where it groweth: but it is of a nature far different from that which both our Latine writers, & those also of forrain countries, haue described: for more like it is to a vine than a Myrtle. It is planted by slips and branches, as the vine: and of late bound and tied also like a young vine. It spreadeth and filleth the hills where it is set, after the manner of those vines in vineyards, which without any helpe of props, support and beare up themselves. Cut likewise it is, pruned, and cleansed, from those superfluous shoots that it puts out. It loueth to be well husbanded, digged about, raked, and trimmed: and with this ordeting, growes apace, so as within three yeres it is fruitfull. It beares a leafe much like to Rue, and continueth with a greene head all the yere long. At the sacking and destruction of Ierusalem, the Iewes in a furious rage both against their owne persons & their goods, would needs haue wreaked their anger and been reuenged on the poore Baulme trees, and haue spoiled them for euer: but the Romans on the other side stood in their defence, so as about this very plant, there was a cruell battell fought. But now these trees are vnited vnto the domaine of our Empire: and by order from the state, are set and maintained: so as neuer at any time before, were they more in number, or taller of growth: howbeit the highest exceeds not two cubits. And three sorts there be of them. The first hath small branches and small like haire; whereupon it is called *Eutheristos*, [i. easie to be cut or loppt.] The second, rough and rugged to see to, bowing and bending forward, full of twigs and branches; sweeter also than the other to smell to, and this they name *Trachy* in Greeke, which is as much to say as Rough. The third they call *Eumeces*, because it is higher than the rest, and it hath besides a smooth barke: this in goodnesse is the second; and the first, named *Eutheristos*, is the worst. The fruit or seed that the Baulme tree beareth resembleth wine in tast, of colour red, and it is not without a certaine veine of fat. The worst part of the graine or fruit, is the lighter in weight, and the greener. It is clad with boughes and leaues thicker than the Myrtle. Now, for to draw the precious liquor out of it called Baulme, incision ought to be made in the barke, with glasse-kniues, with sharp flint stones, or lancets of bones. For it may not abide, that any instrument of yron or Steele should come neare vnto the quicke; it dieth presently if you touch the heart of it therewith: and yet the same will suffer all superfluous

A superfluous boughes and branches to be cut off and pruned. But he that launceth and maketh incision, must guide and gage his hand very artificially in the cutting, that he go not too deep, nor perce a jot farther than the barke. This feat being wought, there issues out of the wound a juice or liquor, which they call *Opobalsamum*, of an excellent and surpassing sweet smell: but it comes forth by small drops: and as it thus weepes, the teares ought to be receiued in wooll, and then afterwards it is gathered and laid vp in small hornes. Out of which it is poured into earthen pots that neuer were occupied. This Baulme when it is fresh and new, may be likened to Oile, in thickenesse and consistence, but in colour it is white; in time it growes reddish, and hard withall, howbeit, cleare and transparent, that a man may see thorough it. During the wars that *Alexander* the Great waged in Iurie, it was ordinarie in a Summers day to gather one spoonefull of this liquor, and that was all that might be done. And when the season serued best

B for this purpose, and that it was counted a plentifull yere, the greater hort-yard or parke of the kings aboue said, neuer yeeldeth in al about 6 gallons, and the lesser but one: sold it was commonly for the double weight in siluer. But at this day, euery tree that may beare it, and hath a larger veine to abide incision, is launced thrice in a summer: and after that, it is loppt and sheared. And those cuttings are good chaffer, and sold very well to the merchant. For being thus lopped once in 5 yeres at the farthest, they yeeld in branches for wood only, eight hundred deniers. This is called *Xylobalsamum*, and it goes into odoriferous compositions: for in default of the right Baulme liquor, the Apothecaries make a shift to serue their turne with the wood alone, called *Xylobalsamum*. As for the very bark, it enters also into many medicinable confections: no manuell therefore if it carrie some price. But it is the liquor only that is so precious, the liquor it is which yeelds that most fragrant smell; then follows the grain or fruit in a second degree, the bark in a third, and the wood as it is last, so it hath least grace and credit. Of the wood, the best is that which in color resembles Box, and giues sweetest sent. But of the fruit, the greatest graines and the weightiest, be most esteemed; such bite at the tongues end, and be hore in the mouth. Howbeit, this is adulterated with the seed of * *Hypericum*, that comes from the citie Petra. But the deceit is soone detected and found, for that seed is not so big, so massie and full, nor so long as the true graine of Baulme: besides, it hath but a dull sauer or none at all, and in tast resembleth pepper. The liquor is knowne to be right or good, if it be oileous and fat, thin, and there, somewhat inclining to red, and, if in rubbing betwene your fingers, it renders a pleasant sauer. The white Baulme may be ranged in a second place of goodnesse: the greene and the thicke is not so good as it: but the blacke is worst. For Baulme as well as Oile, will be stale and worse for the age, if it be kept too long. This is moreover obserued, that in euery incision, that which flowed forth before the seed is ripe, is most precious.ouer and besides, this Baulme may be sophisticated with the owne seed: and hardly can this couenage be found out, but that it hath a bitterer tast than that which is naturall. For the good Baulme should be pleasant and delicat in the mouth, not soure nor tart at all: only in smell it should haue a harsh verdeur. Corrupted it may be otherwise, with Oile of Roses, of Cyperus, of Lentiske, or Masticke, of Ben, of Terebinth, and Myrtles, also with Rosin, Galbanum, and Cyprian waxe, as occasion serues, and according as men list to sophisticat it. But the greatest knauerie of al, is to mingle gum among it: for being so handled, it will stickie and cleaue to the palme or inside of a mans hand, nay, it will sinke in water to the bottome, which are two chiefe properties of the right Baulme. For the very pure and perfect Baulme ought to cleaue too: but when it hath gum mingled among, stick it will likewise, but it will gather soon a brittle rouse or crust vpon it, which quickly cracks and breaks. Also this sophistication is found out by the tast. But in case there be any trumperie of Wax or Rosin, the fire wil soone bewray it; for when it burnes, it will yeeld a more muddie and blacke flame. As for the sophistication made with honie, it may soon be knowne: for presently the flies will take it, and gather thicke about it.ouer and besides, put a drop of pure Baulme into warme water, it will settle to the bottom of the vessell, and congeale: but contrariwise, the counterfeit Baulme, will flote and swim about like oile. Againe, if it haue Galbanum in it, yee shall see a white streak or circle round about it. To conclude, would you know in a word the right Baulme indeed? It will turne milke, and cruddle it: and it wil not stain a cloth. In summe, there is no merchandise and commodity in the world, wherein there is practised more fraud and deceit, than in the trafficke of Baulme. For a Sextare or wine quart of Baulme will cost a thousand Roman deniers by retails, which was bought for three hundred and no more at the hands

of the factors vnder the Emperor, who sold it first. Whereby a man may see how gainfull it is to increase this liquor by sophistications. As for the Baulme wood Xylobalsamum, the price of it is six deniers a pound.

Now it remaines to speake of Storax [Calamita] comming out of that part of Syria, which about Phoenice, confronts and borders next to Iurie: and namely, about Gabala, Marathus and the mount Casius in Seleucia. The tree that yeeldeth this gum or liquor, is also named Styxax, like vnto a Quince tree. It hath first a rawish austere tast, which afterwards turnes to be more sweet and pleasant. There is found within a resemblance of canes and reeds, full of this iuice. Howbeit, about the rising of the Dog star there be certain winged wormes settle vpon the said reeds, creepe in and eat away the marrow (as it were) which lay within: so as a man shall find nought left behind but a mouldy dust or rotten powder, good for nothing. Next to this Storax of Syria, great account is made of that which commeth out of Pisidia, from Sidon, Cyprus, and Cilicia: but least reckoning is made of that which Candie sendeth vs. That which is brought from the mount Amanus in Syria, is good for the Physicians, but better for the perfumers and confectioners. From what nation soeuer it comes, the best Storax is that which is red, somewhat glutinous besides by reason of the fattines. The worst is that which hath no consistence and tenacitie, but crumbles like bran, and is so mouldie that it is ouergrowne with a white hoarie mosse. The pedlers and such like petty merchants can skill how to sophisticate this drug also, with the rosin of cedar and gum: otherwhiles also with honie, or bitter almonds. But all these deceits are known by the tast. The price of the best is 19 deniers a pound. There is a Storax besides which Pamphylia doth yeeld, but drier it is, and nothing so full of moisture.

Moreouer, we haue from Syria out of the same mountain Amanus, another kind of gum called Galbanum, issuing out of an hearbe like Fennell-geant, which some call by the name of the said Rosin, others Stagonitis. The best Galbanum, and which is most set by, is gristly and cleare withall, resembling Hammoniacum, without any spils of wood in it. For in that wise the hucksters vse to deceiue chapmen by mingling beanes with it, or the gum Sagapenum. The right Galbanum, if you burn it, chafeth away Serpents with the strong perfume or smoke thereof. It is sold for five deniers the pound: and is vsed only in Physicke for medicines.

CHAP. XXVI.

¶ Of Panaces, Spondylium, and Malobathrum.

The same perfumers seeke also into the same Syria for Panaces growing there, and yet it is to be found also about Psophis, a citie in Arcadia, and the fountaines from whence floweth the riuer Erymanthus: yea, and in Affricke besides, and Macedonie. This Panax is an hearbe with a tall stalke and round tuft in the head like Fennell, and yet it is a plant by it selfe, growing to the height of five cubits. At the first it putteth out foure leaues, and afterwards six. They be very large and round withall, lying vpon the ground: but toward the top they resemble the leaues of an Oliue: it beareth seed in the head hanging within certaine round tufts, as doth the Ferula. Out of the stalk of this hearb there there is drawn a liquor by way of incision, made in haruest time: and likewise out of the root in Autumne, or the fall of the leaf. And this is called Opopanax. The best looks white when it is gathered and congealed. The next in worth and weight, is that which is yellow. As for the blacke it is of no account. The berter Opopanax costeth not about two Asses a pound.

Another hearbe there is of this Fennell kind, namely Spondylium, somewhat different from the former, but in leaues only: because they be lesse than those of Panax, and diuided after the manner of the Plane leaues. This Spondylium groweth no where but in cold and shadowie places. It carrieth a fruit or graine called also Spondylium, which resembleth the forme of Sil or Siler montanum, and serueth for no vse but Physick.

We are beholden moreouer to Syria for Malobathrum. This is a tree that beares leaues rolled vp round together, and seeming to the eie withered. Out of which there is drawne and pressed an Oile for perfumers to vse. Egypt is more fruitfull of this hearbe than Syria. And yet there comes a better kind thereof from India than both those countries. It is said, that it grows there in meeres and standing waters swimming aloft, after the manner of Fen-lentils or Duckes meat, more odoriferous than Saffron: enclining to a blacke colour: rough in handling, & in tast

M

A salt or brackish. The white is not so well esteemed. It will soon be mouldie when it is stale. The rellish thereof ought to resemble Nardus at the tongues end. The perfume or smell that *Malobathrum or the leafe yeeldeth when it is boiled in wine, passeth all others. It is strange and monstrous, which is observed in the price: for it hath risen from one denier to 300 a pound, whereas the Oile it selfe doth cost 60.

*Folium

CHAP. XXVII.

¶ Of oile Olive, made of Greene Oliues, likewise of Grape Veriuice.

For the mixture and composition of ointments, the Oile of vnripe Oliues and Veriuice is very good: and verily, made it is in two kinds, & after two sorts, to wit, of the Oliue, and the Vine. Of the Oliues, if yee would haue good, they ought to be pressed whiles they be yet white; for if they turn colour once and be blackish, the worse is the Oyle or Veriuice that cometh thereof. And such kind of Oliues be called Drupæ, namely, before they be fully ripe and good to eat, and yet haue lost their colour. And herein is the difference, for that the oyle of this later sort is green, the other is white. Now as for grape Veriuice, it should be made of the Vine Plythia, or Amminea, and before the canicular daies, when as the grapes bee but new knit, and no bigger than the Cich-peafe. The grapes (I say) must be gathered for this purpose, at the beginning before they change colour, & the iuice thereof ought then to be taken. Then should the Veriuice that comes from it, be sunned: and heed must be taken in any case, that no dewes by night do catch it, and therefore it would stand in couert. Now when this iuice or veriuice is gathered, it is put vp in earthen pots: and otherwhiles kept also in vessels of copper. The best grape veriuice, is red, sharp, and soure in taste, dry withall and scyptick. A pound or a pinte of such veriuice is worth six deniers. It may be made in another sort: namely, by punning and stamping vnripe grapes in morters: drying it afterwards in the Sunne, and so made vp into certain rolls or trochisks.

CHAP. XXVIII.

¶ Of Bryon and Oenanthe: of the tree Elate, and Cinnamon Caryopus.

The mosse of the white Poplar or Asp, which is reputed as the grape thereof, is vsed likewise in these odoriferous and sweet compositions. The best grows about Cnidos or Caria, in thirsty, dry, and rough places. A second sort is that which is found vpon the Cedar of Lycia. To this pertaineth Oenanthe, which is no more but the grapes of the wild vine called Labrusca. Gathered it is when it floureth, that is to say, when it smells best. It is dried in the shade vpon a linnen sheet lying vnder it, and then put vp into little barrels. The chiefe cometh from Parapotamia: the second from Antiochia and Laodicea in Syria: and a third sort from the mountaines of Media: and this is best for medicine. Some prefer before all these, that which groweth in the Island Cyprus. As for that which is made in Affricke, it is meet for Physitions onely, and is called Massaris. Now, the better euery is that which they gather from the white wild vine, than from the black. Moreover, there is another tree which serues for perfumes: some call it Elate, and we Abies [i. the Fir] others Palma or the Date, and some againe Spathe. That which grows about the sands of Affricke, where Iupiter Hammons temple standeth, is highly commended above the rest: and after it, that in Egypt. Next thereto is the Syrian. This tree is odoriferous when it grows in dry places only: it hath in it a certaine fat liquor or Rosin, and entereth into compositions of sweet ointments, for to correct and mitigate the other oile. In Syria there is a drug which they call Cinnamon Caryopon. A iuice or oyle this is, pressed out of a certain nut. This Cinnamon differeth much in forme from the stickes of true Cinnamon: indeede about specified: although in smell it cometh neare vnto it. A pound thereof is worth to be bought and sold 40 Asses, [i. 2 lib. 6. d.]

THE

THE THIRTEENTH BOOK OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS

SECVNDVS.

The Proeme.

Thus far forth the woods and Forrests are of estimation, in regard of the pleasure they doe vnto vs for perfumes and sweet odors: and in truth, if we consider duly these aromaticall plants, admirable they becuere one in their kinde, euen as they be weighed apart by themselves alone. But such is the riot and superfluitie of man, that being not content with that perfection of Nature shining in those plants and trees alone rehearsed, he hath not ceased to mingle and compound them, and so of them all together for to make one confused smell: and thus were our sweet ointments and precious perfumes deuised, whereof we purpose to write in this booke next ensuing.

CHAP. I.

¶ Of Ointments, Perfumes, and their compositions: and when they came into knowledge first at Rome.

As touching the inuention of Ointments, it is not well known how as the first that deuised them. Certaine it is, that during the raigne of the Troianes, and whilest Ilium stood, men knew not what they meant: nay, they vsed not so much as Incense in Sacrifice and diuine seruice. The fume and smoke of the Cedar and the Citron trees onely, the old Troianes were acquainted with when they offered sacrifice: their fuming and walmng steame (more truly I may so terme it, than any odoriferous perfume) they vsed: which they might easily come by, since they were plants growing among them, and so familiar; notwithstanding they had found out the iuice of Roses, wherewith yet they would not correct the foresaid strong fumes in those daies; for that also was knowne to be a commendable qualitie of Oile Rosate. But the truth is, The Persians and none but they ought to be reputed the inuention of precious perfumes and odoriferous ointments. For they to palliate and hide the ranke and stinking breath which commeth by their surfet and excesse of meats and drinks, are forced to helpe themselves by some artificiall meanes, and therefore goe euermore all to be perfumed and greased with sweet ointments. And verily, so farre as euer I could finde by reading histories; the first prince that set such store by costly perfumes, was King *Darius*, among whose coffers (after that *Alexander* the Great had defeated him and woon his campe) there was found with other roiall furniture of his, a fine casket full of perfumes and costly ointments. But afterwards they grew into so good credit euen among vs, that they were admitted into the ranke of the principal pleasures, the most commendable delights, and the honestest comforts of this life. And more than that, men proceeded so far, as therewith to honour the dead: as if by right that duty belonged to them. And therefore it shall not be amisse to discourse of this theame more at large. Wherein I must aduertise the Reader by the way, that for the present I will but only name those ingredients that go into the composition of these ointments: such I mean as came not from herbs and trees, shrubs & plants; referuing the treatise of their natures, vertues, and properties, vnto their due place.

First

A First and formost therefore, all perfumes took their names either of the country where they were compounded, or of the liquors that went to their making, or of the plants that yielded the simples and the drugs: or els of the causes and occasions proper and peculiar vnto them. And here it would be noted also principally, that the same ointments were not alwaies in like credit and estimation: but one robbed another of their honor and worth: inso much, as many times vpon sundry occasions, that which was lately in request and price, anon gaue place to a new and later inuention. At the first in antient time, the best ointments were thought to come from Delos; but afterwards, those that were brought out of Ægypt: no talke then but of Mendesium, compounded at Mendes, a city there. And this varietie and alteration was not occasioned alwaies by the diuersity of composition and mixture, but otherwhiles by reason of good or bad drugs: for ye should haue the same kind of liquors and oiles better in this country for one purpose, and in that for another: yea, and that which in some place was right and true, the same did degenerat and grow to a baillard nature, if you changed once the region: for a long time, the oile or ointment of Iris or the Floure-de-luce root made at Corinth, was in much request, and highly praised: but afterwards that of Cizicum won the name and credit, for the artificiall composition thereof. Semblably, the oile of Roses that came from Phaselus, was greatly called for: but in proesse of time, Naples, Capua, and Præneste, stole that honor and glory from thence in that behalfe. The ointment of Saffron, confected at Soli in Cilicia, imported for a good while and carried the praise alone: but soone after, that of Rhodes was euery mans money. The oile drawne out of the floures of the wild vine in Cyprus, bare the name once; but afterwards that of Ægypt was preferred before it: & in the end the Adramytians gained the credite and commendation from both places, for the perfect and absolute conffection thereof. The ointment made of Marjoram, gaue credit for a certain time to the Isle Cos: but not long after, their name was greater for another made of Quinces. As for the oile Cyprinum, which came of Cypros, the best was thought to be made in Cyprus: but afterwards there was a better supposed to be in Ægypt: where the ointments Metopium and Mendesium all of a sudden were better accepted than all the rest. It was not long first, but that Phoenice put Ægypt by that credit for those two singular compositions, & left the Egyptians the name alone for the foresaid oyle Cyprinum. The Athenians were renowned for their antient Panathenaicum, & euer held their own. There was in old time a notable composition named Pardalium, made in Tharsus: but now the mixture & making thereof is quite lost. The ointment likewise Narcissimum, where the floure of the Daffodil was the Basis, is now forgotten, and no more made of it. The manner of compounding all these ointments, was twofold, to wit, either of the iuice & liquor, or els of the very substance & body of the simples. The former sort resemble rather the nature of oiles: but the later of ointments. And these the Greeks call either Stymmata, which yeeld the consistence & thicknes to ointments, or Hedysmata, which serue to aromatize and giue a compleat perfection to them. There is a third thing between these, requisit also to the full making of these sweet ointments, namely, the colour: although many take no regard at all of it. And for this purpose, the perfumers put into their compositions Cinnabaris [i. Vermillion] or Sanguis Draconis and Orcanet. The salt moreover that is strewed among, serueth to repress and correct the nature of the oile that vniteth all the ingredients besides. But those that haue the root of Orcanet in them, need no salt at all to be put in besides. As for Rosin and Gum, they are mingled with the rest to incorporate the drugs and spices, and to keep in the sweet odour thereof, which otherwise would evaporate and soon be lost. We are to presume by all likelyhood, that the first composition of ointments and soonest made, was of the odoriferous mosse Bryon, and the oile of Ben onely: whereof we haue written in the former book. Then came in place a more compound ointment called Mendesium, and that received Rosin also to the foresaid oile of Ben. And more than that, another besides named Metopium. Now is this Metopium an oile compounded, which the Egyptians do presse out first of bitter Almonds, but they added thereto for to incorporate the better, grape Veriuiice: and the ingredients besides, were Cardamanum, Squinanth, sweet Calamus, Hony, Wine, Myrrhe, the graines or seeds of Baulme, Galbanum, Rosine, and Turpentine. One of the meanest and basest ointments now adaies, and therefore thought to be as antient as any other, is that which consists of the oile of Myrtles, sweet Calamus, Cypress, and Cypros; [Squinanth] Lentiske, and the rind of the Pomegranat. But I would thinke verily, that Ointments came to be so diuulged and common euery where abroad, by meanes of Roses most

of all: considering, that nothing grows more ripe in all places. Which was the cause, that the simple mixture of oile Rosate, without any sophistication besides, continued for a long time, hauing the addition of grape Verjuice, the floure of Roses, the Saffron, Cinnabaris, or Sang- Dragon, Calamus, Hony, Squinanth, the floure of salt called Sperma-ceti, or els in lieu thereof the root of Orcanet, & Wine. The oile or ointment of Saffron was after the same sort made, by putting thereto Cinnabaris, Orcanet, & wine. Semblably is to be said of the oile of the sweet lesse Maioran, wherein was mixed grape verjuice and sweet Calamus. This composition was singularly well made in Cyprus & at Mitylene, where great store of sweet *Majoran grows. There be other oiles likewise which are not of so good reckoning, namely, of Myrtles, & Bayes, which receiue a mixture with the addition of Majoran, Lillies, Feni-greek, Myrrhe, Casia, Spikenard, Squinanth, & Cinnamon. Moreover, of great quinces & the lesse called Mala Struthea, is made the oile Melinum, whereof we wil speake hereafter: which the perfumers vse in their ointments, by putting thereto grape-verjuice, the oile Cyprinum, the oile Sesamine, Baulme, Squinanth, Casia, & Sothernwood. As touching the oile of *Lillies, which is the most subtil and thinnest of all other, it is made of Lillies, Ben, sweet Calamus, Hony, Cinnamon, Saffron, Myrrhe, & Aspalathus. Also the foresaid oile Cyprinum is made of the floures of Cypros, of Veriuiue, Cardamomum, Calamus, Aspalathus, & Sothernwood. Some there be that put moreouer vnto this oile, Myrrhe & Panace. The Sidonians are excellent at the making of this composition: & after them the Egyptians, so that they put not in Sefamium oile: for it wil last & keep good ful four yerres: & if it begin to lose the smel, it is quickned and refreshed again with Cinnamon. Now as touching the ointment of *Feni-greek, it is made of fresh oile, Cyperus, Calamus, Melilot. Feni-greeke, Hony, oile of Quinces, the greater & the lesse sweet Marioram. This was of highest reputation in the daies of *Menander* the comical poet. But long after there succeeded into the same place of credit, the ointment Megalium: so called for the great glory that it caried: & this was compounded of the oile of Ben, of Baulm liquor, sweet Calamus, Squinanth, Balm-wood, Casia, & Rosin. In the making hereof, this property it had by it selfe, that all the while it was a compounding and seething, it should euer and anon be vented, & shifted out of one vessell into another, vntill the smel of it were gone. Which neuerthelesse it would recouer againe after it was once cold. Moreover, some liquors there be of themselves, that without any other mixtures may serue and go for noble sweet ointments. Among which, that of Malabathrum is the chief: next to it the Flour-de-luce of Sclauonia, and the great sweet Marioram of Cyzicum. Howbeit, the Herbarists loue to be putting in some few spices besides, as well in the one as the other: but some make choise of one thing, some of another to intermingle withall. They that take delight to haue their mixtures most compound, adde vnto either of those abouenamed, Hony, the floure of salt, grape verjuice, the leaues of Agnus Castus, and Panace, & generally all that be strange and forraign, to make their compositions seem more wonderful. To the oile or ointment of Cinnamon, there goes the oile of Ben, Balm-wood, sweet Calamus, Squinanth, the *fruit or seedes of Balsamanum, Myrrh, & Hony Aromatical. This is of all other the thickest ointment in substance. The price of this, is from 35 deniers to 300 the pound. As for the ointment Nardinum or Foliatum, it is composed of the oile of green Oliues or grape verjuice, of the oile of Ben, of Squinanth, Costus, Spikenard, Amomum, Myrrhe, and Baulme. Howbeit, this point would not be forgotten in the making of this composition, that it is a very easie matter to sophisticate it; by reason, that there be no fewer than nine herbs or simples which we haue declared, that come neere to the Indian Spikenard, and may be taken for it. Finally, to quicken and fortifie the sert of all these ointments, there must no spare be made of Costus and Amomum, which of all other drugs pierce into the nostrills, and cast a strong smel. To make them thicker and more pleasant, there would be good store of Myrrhe put in: but to haue them better for the vse of Physicke, and more medicinable, it is good to season them wel with Saffron. As for Amomum, of it selfe alone it causeth all ointments where it comes to be most quicke and peneratiue: in so much as it causeth head-ache. Some for to spare cost thinke it sufficient to aromatize onely these ointments with those drugs that are so deare and precious, either by strewing the powder, or sprinkling their liquors amongst, whereas the rest of the ingredients be boiled: but such compositions be nothing so effectual, as when all be sodden and fermented together. As for Myrrhe it selfe, it maketh alone a precious ointment without any other oile. I meane that one-ly of the liquor Staete: for otherwise it is exceeding bitter and vnpleasant. If it bee mingled with

A with the oile Cyprinum, it looketh greene; if with the oile of Lillies, it will be fatty and vnctuous; if with Mendesium, blacke; with oile Roset, white; with that of Myrrh, pale. Lowhat were the inuentions in old time of aromaticall and odoriferous ointments: loe what were the deuises afterwards of the shopkeepers and perfumers, to picke pence out of our purses, and to rob vs. It remains now to speak of the paragon indeed of all these pleasures and delights: of that I say wherein consists the very height and chiefe point of this argument in hand.

CHAP. II.

¶ Of the Ointment called Roiall: of drie Perfumes, Powders, and Pomanders: and how they be kept.

B T He Roiall Ointment therefore (which the Parthian kings vsed ordinarily, and of whome it took that name to be called Roiall) is tempered and composed in this manner: to wit, of Ben, Costus, Amomum, Cinamon, the Arbut or Comarus, Cadamonum, Spikenard, Marum, Myrrhe, Casia, Storax Calamita, Ladanum, Baulme liquor, sweet Calamus, Squinanth of Syria, the floure of the wild vine, Malabathrum, Sericharum, Cyperus, Aspalathus, Panace Saffron, Cypros, Marioram the greater, clarified, or purified Hony, and Wine. As for Italy (the Saffron, Cypros, Marioram the greater, clarified, or purified Hony, and Wine. As for Italy (the lady and conquereesse of all other nations) there grows nothing in it good to make ointments, no nor nothing throughout all Europe, vnlesse it be the Flour-de-luce root, and the Celticke Spikenard: for wine, Roses, Myrtle leaues, and oile, are well known to be common for all countries.

C As for those mixtures which be called Diapasmata, they consist of dry spices and drugs. Also the dregs or grounds of Ointments, they cal Magma. Moreover, this is to be obserued in the mixture and composition of those Ointments, That the drugs which be put in last, are euer the strongest and most effectual.

Now as touching the keeping of Ointments, they are best preferred in pots or vessels of Albastre: and Odors are surest maintained and continue longest, being incorporate in oile: which the fatter that it is, serueth better for a continuance of their sent; as a man may see very well in the Oile of Almonds. And to say a truth, the older that an ointment is, and the longer fermented, the more vertue it hath for the age. The sun is an enemy vnto them, and therefore they must incorporate and vnite together in the shade, and be put vp in vessels of lead. The trial of them is taken with the back-part of the hand, for feare lest that the heat of the fleshie side within, should corrupt and marre them.

CHAP. III.

¶ Of the Superfluitie in expence at Rome, about these Ointments: and at what time they were first vsed there.

E A T this day there is not in Rome any thing wherein men more exceed, than in these costly and precious ointments: and yet of all other, they are most superfluous and may be best spared. True it is, that much money is laid out vpon pearles and precious stones; but these are in the nature of a domaine and inheritance, and fall to the next heire in succession. Againe, a rich and costly apparell stand vs in a great deale of coine; howbeit they are durable and last a long time: but Perfumes and ointments, are soone done and gone; they exhale and breath away quickly; they are momentanie, they serue but for the present, and die suddenly. The greatest water in them, and their commendation is this, To cause a man (what businesse soeuer he hath otherwise) to cast his eie and looke after a gentlewoman as she passes by perfumed in the streets, and sendeth a smel from her as she goes. This is all the good they do; and yet forsooth a pound of this ware must cost 400 deniers: so deare is the pleasure that passes from our selues & goes to another: for the party himselfe that carrieth the perfume about him, hath little or no delight at all in it: others they be that read the benefit and pleasure thereof. And yet among these odorous compositions, there is choise and difference betweene one and another. We finde in the writings of *M. Cicero*, that he made more account of those ointments that saoured of the earth, than those which smelled all strong of Saffron: as if he meant thereby, That in this excessive disorder and most corrupt enormitie of all others, a certaine moderation yet and sad delay would

would do well; and that a feuerity (if I may so say) in the vice it self, were better to be liked. But some take delight especially in thick and grosse ointments, and are not content to be perfumed yea and bathed all ouer, vnlesse they be besmeared, greased, and daubed also therewith. I haue my selfe seen some of them to annoint the very soles of their feet with these precious Baulms. and (by report) it was *M. Otho* that first taught the Emperor *Nero* this wanton delicacie. But I would gladly know, and some good body tell me, I pray, how he could feele the smell thereof, and what delight or contentment it might yeeld from that part of the body? I haue heard say besides, by some of the inward familiars and speciall fauorits of this prince, That he commanded the very walls of his baines and stoues to be perfumed with precious ointments: and that *C. Caligula* the Emperor, caused the very vessels and seats wherein he vsed to sit when he bathed or swet in his hot house, to be in that manner annointed. And because this might not seeme to be a speciall pleasure fit for an Emperor onely, I knew one of *Nero's* seruants afterwards, who vsed so to do as well as his lord and master. But I muse and maruell at nothing so much, as that this wanton delight should find the way and enter so far as into the mids of the camp. For wot ye what? I assure you the very standards and ensignes, the *Egles* (I say) and *Minotaures*, so dusty as they be otherwise, so foule and ill-fauored, as being kept so long, and standing by vnoccupied, are wont forthwith to be annointed and perfumed vpon high and festiuall daies. And, so god helpe me, I would I knew who it was that first brought vp this fashion and needlesse superfluitie: Certes, I would not defraud him of his due honor: I would (I say) recommend his name vnto all posterity. But thus it is (no doubt) and it cannot otherwise be; Our *Egles* and standers (bribed, hired, and corrupted with this so good a reward) haue therefore in recompense conquered the whole world. Vnder such colors and pretences (indeed) we deceiue our selues, and cloake the vice and ryot of our times: and thus hauing so good a reason as this, to induce and draw vs on, we may not sticke to haue precious baulms vpon our heads, so it be vnder our fallats and mourninges.

To say for certainty and precisely, when this enormity entered first into Rome and began there to raigne, I am not able. Sure it is, as appeareth vpon record, That after the subduing of *K. Antiochus* and the conquest of Asia, which was about the 565. yeare from the foundation of Rome, *P. Licinius Crassus*, and *L. Iulius Caesar* the Censors, published an edict, prohibiting and forbidding to sell any foreine or strange ointments within Rome: for so they termed these sweet mixtures and compositions. But (beleue me) now adaies, some there be so wanton and delicate, that there is no wine or other drinke good with them, nor will go downe their throat, vnlesse it be spiced and aromatized with these baulms: and so little passe they for the bitternesse of these odours and smells, that they are well content to waite and spend a deale thereof, without and within, behind and before, aboue and beneath, to enioy the perfume thereof in all parts of the body. Well knowne it is, that *L. Plotius*, brother to *L. Plancus*, a man of great credit and authority, as hauing bin twice Consul, and Censor besides, being outlawed and proclaimed a banished person by the decree of the * *Triumvirs*, was discovered within a certaine caue at *Salernum*, where he lay close hidden and sure enough otherwise, by the very smell onely of a precious ointment that he had about him: and so by that meanes (besides the shame and disgrace that he receiued, thus to detest himselfe and be found of his enemies) the rigor of the act and arrest that passed against him, was executed and performed vpon his body. And who would euer pittie such persons, & not iudge them worthy to come to so bad an end? but to conclude all this discourse, there is not a country in the world that yeelds such plenty and varietie of drugges fit for these compositions, as *Egypt*: and next to it, *Campaine* in *Italy* may carry the name, for the store of roses there growing.

CHAP. IIII.

¶ Of Dates, and Date trees: their nature and seuerall kinds.

The land of *Iury* is as much renowned, or rather more, for the abundance of Palms or Date trees which it affoordeth: the discourse whereof we will now enter into. True it is, and it cannot be denied verily, that there be of them found in Europe, and namely, euery where in *Italy*; but such, be all of them barren. Also in the maritime parts and sea-coasts of *Spaine*, ye shall meet with Palmes that beare Dates, but they are but rart and vnpleasant, and indeed neuer come

A come to their maturity and ripenesse. Those of *Africk*, I must needs say, bring forth a sweet and pleasant fruit, but it will not last, and soon is gone: whereas contrariwise, in the East parts, the people make wine thereof; and in some countries they vse it for bread, yea the very bruite and four-footed beasts do ordinarily feed of Dates: and therefore we hold and conclude, that Dates may be truly called, forrein fruits; and their Trees, meere strangers in this part of the world. For in *Italy* a man shal not find so much as one Palm tree that comes vp of it selfe, without it be set or planted by mans hand: neither in any other region whatsoeuer, vnlesse it lie vnder some hot climat: but to beare fruit ye shal neuer know it in any country, if the same be not extreme ardent and seortching. Date trees loue a light and sandy ground, and specially (for the most part) if it stand much vpon a veine of Nitre besides. And yet contented will they be to grow by some rivulet side, where they may haue, as it were, one foot in the water, and be euer drinking of the yere long, especially in a drie season. Some thinke, that dung is as contrary and hurtfull vnto them, as to some kind of Citron trees in *Assyria*, vnlesse it be mingled & tempered with water, or the trees planted neere to some running river. Moreover, many kinds there be of Date trees, and the first are smal, and exceed not the bignesse of shrubs: these in some parts are barren, and in others fruitful: they shute out little short branches round about, but very full of leaues, the which in most places serue in stead of parget & rough-cast, to defend wals of houses against the weather and drifts of rain. Howbeit a second sort there be that are much taller, and whole Forrests stand only vpon those trees: they put forth leaues sharp pointed, and they grow round about disposed one close vnto another in manner of comb-teeth: and these must of necessitie be taken for wild, and no better: and they loue here and there as it falleth out, to be intermingled among those of the tamer kind, as if they tooke I wot not what pleasure in their company. The rest growing in the East parts, be streight, round, and tall, enuironed about the body with circles or houps, made of the very barke it selfe, and they are of the thickenesse of a mans thumbe, set in order one aboue another like steps & greeces neere together, in such sort that the people of the East may easily climbe them, by the means of the said barke, which serueth not onely for a vestiment to the tree, but also for staires to him that would mount vp, so that it is a wonder to see how nimbly a man will run vp to the top. These Date trees beare all their branches toward the head, and their fruit comes not forth among the leaues as in other trees, but hangerth to certaine branches and twigs of the owne between the boughes like clusters of grapes: in so much as it resemblerth partly the nature of a grape, and partly of an apple. The leaues made in forme of a knife blade sharp toward the point, slit as it were and clouen in the edge along both sides, make shew at the first of certain faire and beautifull gems: and now they serue in stead of cords, and to bind vines together: also being diuided and sliued into flakes, they are good to plait for hats and light bongraces for the head, against the heat of the Sunne. Moreover, all learned men who are deeply studied in the secrets of Nature, be of opinion & do teach vs, That in all trees and plants, nay rather in all things that proceed out of the earth, euen in the very herbs, there are both sexes. Let it suffice therefore to haue spoken thus much once for all in this place. But there is no tree whatsoeuer, in which this distinction of male and female appeareth more, than in *Palme* trees: for the male putteth forth his bloome in the branch, but the female sheweth no floure at all; but sprouteth and shooteth out buds in manner of a thorne: howbeit both in the one and the other, the pulp or flesh of the Date commeth first, and after it the woody stone within, which stands in stead of the grain and seed of the Date. And this appeares euidently by a good token, for that in the same branch there be found little yong Dates without any such stone at all. Now is the said stone or kernell of the Date, in forme long, not so round and turned like a ball as that of the *Oliue*. Besides, along the back it hath a cut or deep slit chamfered in (as it were) between two pillowes, but in the mids of the belly on the other side, for the most part it hath a round specke, formed like a nauill, whereat the root or chit beginneth first to put forth. Moreover, for the better planting of Dates, they set two together of their stones in a rank with the bellies downward to the earth, and as many ouer their heads: for if one alone should come vp, it were not able to stand of it selfe, the root and yong plant would be so feeble; but four together so ioine, clasp, and grow one to another, that they do well enough and are sufficient to beare themselves vpright: the kernel or woody substance within the Date, is diuided from the fleshy pulp and meat thereof, by many white pellicles or thin skins between: neither lieth it close thereto, but hollow a good distance from it, saue that in the head it is fastened therunto by a thred or

string; and yet there be other pellicles that cleave fast and sticke to the substance of the Date within. The Date is a yeare in ripening. Howbeit in certaine places, as namely in Cyprus, the meat or fleshie pulp thereof is sweet and pleasant in taste, although it be not come to the full ripenesse: [where also the leafe of the tree is broader, and the fruit rounder than the rest.] many then you must take heed not to eat and swallow down the very bodily substance of it, but spit it forth after you have wel chewed & sucked out the iuice thereof. Also they say, that in Arabia the dates haue but a faint & weak sweetnes with them: & yet K. *Inba* makes greatest account of those which the region of the Scenites in Arabia doth yeeld, where they be called *Dabula*: and he commendeth them for their delicate and pleasant taste, before all others. Moreouer, it is constantly affirmed, That the females be naturally barren, and will not beare fruit without the company of the males among them to make them for to conceiue: yet grow they will neuertheless and come vp of themselves, yea and become tall woods: and verily a man shall see many of the females stand about one male, bending and leaning in the head full kindly toward him, yeelding their branches that way as if they courted him for to win his loue. But contrariwise, he a grim fir and a coy, carries his head aloft, bears his bristled & rough arms vpright on high: and yet what with his very lookes, what with his breathing and exhalations vpon them, or else with a certain dust that passes from him, he doth the part of an husband, in so much as all the females about him, conceiue and are fruitfull with his only presence. It is said moreouer, that if this male tree be cut downe, his wiues wil afterwards become barren and beare no more Dates, as if they were widows. Finally, so euident is the copulation of these sexes in the Date trees, & knowne to be so effectually, that men haue deuised also to make the females fruitful, by casting vpon them the bloomes and down that the male bears, yea, and otherwhiles by strewing the powder which he yeelds vpon them. Besides the maner abovesaid of setting date stones for increase, the trees may be replanted of the very truncheons of two cubits long, sluied and diuided from the very brain (as it were) of the green tree in the top, and so couched and interred, leauing only the head without the ground. Moreouer, Date trees wil take again and liue, if either their slips be pluckt from the root, or their tendrils & small branches be set in the earth. As for the Assyrians, they make no more adoe, but if it be a moist soile, plash the very tree it selfe whole as it stands, and draw it along and so trench it within the ground, and thus it will take root and propagate: but such will neuer proue faire trees, but skrebs only. And therefore they deuise certain Seminaries or Nource gardens of them, and no sooner be they of one yeares growth, but they transplant them; and so againe a second time when they be two yeares old: for these trees loue alone to be removed from one place to another. But whereas in other countries this transplantation is practised in the spring, the Assyrians attend the very mids and heat of Summer, and in the beginning of the Dog-daies vse to replant them. Moreouer, in that countrie they neither cut off the heads, ne yet shred the branches of the yong plants with their hooks and bills; but rather bind vp their boughes, that they may shoot vp in height the better. Howbeit, when they are strong, they cut their branches, for to make the bodies burnish and waxe thicker, but yet in the lopping they leaue stumps of boughes halfe a foot long, to the very tree: which if they were cut off, in other places, would be the death of the mother stocke. And forasmuch as Date trees delight in a salt and nitrous soile (according as hath bin before said) the Assyrians therefore when they meet not with a ground of that nature, strew salt, not close about the roots, but somewhat farther off. In Syria and Egypt, there be some Date trees that diuide themselves and are forked in twaine, rising vp in two trunks or bodies. In Crete, they haue three, and some also fiue. The nature of the Palme or Date tree, is to beare ordinarily when they be three yeares old: howbeit in Cyprus, Syria, and Egypt, it is foure yeares first ere some bring fruit; yea and fiue yeares before others begin: and such neuer exceed a mans heighth, neither haue they any stone or woody kernel within the Date so long as they be young and tender: during which time they haue a pretty name for them, and call them Gelded Dates: and many kindes there be of these trees. As for those that be barren and fruitlesse, all Assyria and Persia throughout, vse them for timber to make quarters and pannels for feeling, wainescot, and their fine ioyned works. There be also of Date trees coppey woods, which they vse to fell and cut at certaine times: and euermore they put forth a yong spring from the old root and stock. These haue in the very head and top, a certain pleasant and sweet marow, which they terme, The braine: and therefore those that loue to eat it, wil cut and take it away, & yet the tree wil liue neuertheless: a thing

- A a thing that ye shall not lightly see in any others of that kinde. As for those Date trees which haue broader leaues, & the same soft and pliable, very good to make windings to bind vines and such like, they be named by the Greeks *Chamæropes*: great abundance there is of them in Crete, but more in Sicily. The wood of Date trees yeelds coles, that in the burning will keep fire long: howbeit a dead flame it is that they make, and nothing quicke. As touching those that be fruitfull, some beare Dates with a short stone or kernell within; others with a longer: these are more soft, those be harder. Some carry a kernell of a bony substance, like the Moon Croissant, which many are wont to polish with some tooth, and in a kind of religion are perswaded, that it is good against witchcraft, & is of vertue to procure womens loue. Some of these stones be clad and couered with many skins or pellicles, & others with fewer: ye shall haue in this Date, those tunicles thick & grosse; in that, thinner and more fine. In sum, if a man would search into them particularly, hee should find fifty sundry sorts of Dates saue one, with seuerall, strange, and barbarous names, and as many different wines made of them. But the principall and most excellent of all the rest, synamed Roiall Dates, for that they were referred to the kings owne mouth of Persia, were knowne to grow nowhere els but in Babylon, and in one hortyard or park only of a Bagous (for so they vse to call their eunuches or gelded persons, and such in times past reigned as KK. ouer them;) and this park was euermore annexed to the crowne, and went with the royal Scepter, as a chiefe demaine of the Empire, and passed from one Prince to another by succession. But in the South-countries and meridionall parts of the world, the Dates synamed Syagri are highly commended aboue all others, and most esteemed: and next to them, those which be called Margarides, are in account and good request: these be short, white, and round, more like in form to berries and little buttons, than to mast-fruit and Dates indeed: whereupon they took their name of Pearls, which they do resemble. It is reported, that in the city Chora, there is one of these trees that beare Dates like to Pearles; as also another that carries the Dates Syagri. I my selfe verily haue heard strange things of this kind of tree, and namely in regard of the bird Phoenix, which is supposed to haue taken that name of this Date tree [called in Greeke *phœnix*] for it was assured to me, that the said bird died with that tree, and reuiued of it selfe as the tree sprung againe. Now at the very time that I wrote this History of Natures works, I saw the same tree with fruit vpon it: the Date that it bears is great, hard, rough in handling, and in taste resembling some harsh and wild fruit, far different from other kinds of Dates: in such sort, as I wondered not at the name of Syagros, so like it tasted to the flesh and venison of a wild Bore in the Forrest, that comes to our board. In a fourth rank of Dates for goodnesse, are to be ranged those which they call Sandalides, for the resemblance of slippers or pantofles which they vse in old time, named Sandalio. But in these daies they be as rare, as otherwise pleasant; so that within the bounds of Æthyopia (a wonderfull matter) there be not aboue fiue of them to be found. After the Sandalides, the Dates Caryotæ are in greatest request; for they be not only good to eat, but also a wine is made of their iuice, which they yeeld in great abundance: for all the people of the East make their speciall drink thereof. But true it is, that this kind of wine is hurtful to the head, and therefore the Greeks gaue it that name. Now as these countries aboue said doe afford plenty of Date trees, and the same fruitfull enough, so Iury alone carries the name and the praise for goodnesse of Dates; and not all Iury neither, but the territory about Iericho especially: and yet I must needs say, that there be gathered very good Dates in the vales of Iury, which be named Archelais, Phaselis, & Liuias. And these Dates of Iury, haue this special property aboue all others, To be full of a far white liquor resembling milk, which hath a certaine taste of wine, and is exceeding sweet and pleasant withall like honey. The drier kind of these Dates be those that tooke name of one *Nicolas*, and were called Nicolai: passing faire and great they be aboue all others by far; for foure of them laid in a rank one at the end of another, will make a cubit in length. Other Dates there be, not so faire to the eie as these Caryotæ, but surely for pleasant taste they may be well their sisters, like as they be called thereupon Adelphides. And a third kind there be of the same Caryotæ, which they commonly call Pateton: ouer full they are of liquor, and so drunke (as a man would say) with their own iuice, that they burst euen as they hang vpon the tree their mother, yeelding their wine in that manner of their owne accord, as if they were troden with mens feet in a wine-presse; and thereupon they got that name. Another kind there is yet by it selfe, of those Dates that be drier than the rest, and they be very long and slender, yea, and otherwhiles not streight, but bending and crooked. As for those

which we dedicate to holy vses, and namely, when we sacrifice and offer oblations to the gods, **G** the Iews (a nation aboue all others noted for contempt and mockery of the gods their worship and diuine seruice) do name Chydæi [i. vile and of no price.] The Dates in Egypt called Thebaides, as also those in Arabia, be all ouer-drie and withered, poore, leane, and thin. Parched as they be continually with the heat of the sun, a man would deem they were couered with a crust or shell, rather than with a skin or pill. Go further into Æthiopia, there they be so dry that they will soon crumble into powder like meale; and indeed they make thereof their bread, when it is tempered and wrought with water. These Dates be round, and bigger than a good apple; and they grow vpon a plant or shrub which spreads branches of a cubit length: and the Greeks call them Cycæ. They hang 3 yerres before they be ripe: and euermore you shall see vpon the tree Dates ripe, when others come new forth green and small. As for the Dates of Thebais in high **H** Egypt, so soon as they be gathered, presently they are put vp into barrels, whiles their naturall heat is in them; for if that course were not taken with them, it would soon exhale and vanish away: yet will they decay and rot, if they be not baked againe in the oven. As touching all other Dates, they seeme to be the common and vulgar sort, simply called Dates: and yet both the Syrians and K. Iuba, hold them for junkets and banketting dishes. For as in some part of Phoenice, and Cilicia they be called Balani, [i. glandes or mast] so we at Rome terme them by the verie name of their own country Phoenice, & by no other. And euen of them there be many kindes; and those different one from another, either in forme, for that some be round, others long, or els in colour, whiles there be of them red and black: in which regard, a man may obserue in them, (by report) as great variety as in figs: howbeit the whitest be the best and most commended. **I** Great diuersity there is also among them in quantity and bignesse, inasmuch as yee shall haue many of them that want nothing of a cubit; and other for them againe no bigger than a beane. Now as touching the Dates that be barrelled vp and kept, they be such only as come from salt and sandy grounds, as in Iury, and Cyrenaica in Africk: for those of Egypt, Cyprus, Syria, and Seleucia in Assyria, will not keepe and be preferred; and therefore they must be spent out of hand: for which they take good order to franke their swine and feed other cattel fat with them. The true signe to know a faulty or a stale date, is this, If a certaine white specke or wart which sticke vpon it when it grew on the branch, be shed and faine off. Now to conclude this treatise, I thinke it not amisse to set downe for an example, what did betide the souldiers that were of **K** Alexanders army, who with eating of green dates new ripe, were choked, and so died. In the Gedrosians country, this accident befell vnto them, onely by the nature of the fruit it selfe, eat they of it as moderately as they could; but in other parts, their greedy and ouer liberall feeding vpon them, was their bane. For surely new dates as they come from the tree, are so exceeding pleasant and delicious, that a man can hardly forbear and make an end in good time, before hee surfeit of them and catch a shrewd turne.

CHAP. V.

¶ Of the trees in Syria.

Besides the Date tree, there be other especiall trees in Syria proper vnto that countrey: for in the first place there are a kind of Nuts there growing, commonly knowne and called Fisticks. And (by report) this vertue they haue, either taken as meat, or drunke in drink, To resist the sting and biting of serpents. Also out dry * Figs, and a lesser sort than they named Cortana come from thence. Also the Damascene prunes, growing vpon the mount Damascus; as also the fruit Sebesten are the commodities of Syria: how fouer they are now familiar herewith vs in Italy. As for Sebesten, there be wines in Egypt made thereof. Also the Phoenicians haue a lesse kind of Cedars much like to the Iuniper: and two sorts there be thereof, the Lycian and the Phoenician, which differ in the leafe: for that which hath an hard, sharpe, and prickie leafe, is called Oxycedrus: full of branches it is besides, and so knurrie, that it is troublesome to the hand. As for the other Cedar, it hath an excellent smell. Both twaine doe beare a fruit of the bignesse of Myrtle leaues, and sweet in tast. Moreover, of the greater Cedar there be two **M** kindes: that which doth blossome, beareth no fruit: and contrariwise, that which is fruitfull, sheweth no blossome: and in this, the new fruit commeth forth alwaies before the old of the former yere be ripe and gathered: also the seed of it is like that of the Cypresse. Some cal this Cedar,

Cedar, Cedrelate: whereof commeth the best Rosin. And the timber of it is euerlasting, wherefore in old time they were wont to make the images of the gods, of this wood, as it appears by the statue of *Apollo Sosianus*, made of Cedar wood, brought from Seleucia. In Arcadia there is a tree like the Cedar, but in Phrygia it is called a shrub.

CHAP. VI.

¶ Of the Terebinth.

Morcouer, in Syria grows the Terebinth or Terpentine tree. The male beareth no fruit: The females be of two sorts: the one carrieth red grains of the bignesse of Lentils, the other bring forth pale seeds. This fruit of the Terebinth ripeneth with grapes. Vpon the **B** mountain Idæ neere Tioas, it is as big as a beane, more pleasant to smell to, and glutinous like Rosin, if a man handle it. But in Macedonie the tree is but short, and spreadeth branches like a shrub: contrariwise, about Damascus in Syria, it is very great and tall. The timber of it is verie tough, continueth a long time, and neuer shrinks for age: of colour blacke, but passing faire, and resplendent withall. It puts forth floures in clusters after the manner of the Oliue, but it is red: and the leaues otherwife grow very thick. It beareth also certaine small cods or bladders full of a gummy and clammy moisture (which also issueth out of the barke) and out of those bladders there come forth little flies like gnats.

Also the male Rhus or Sumach of Syria doth beare fruit: whereas the female is barren. This plant putteth forth leaues like to the Elme, but that they be somewhat longer, and full of hairs, **C** and euermore the steles of the leaues grow contrary one against the other. As for the branches, they be slender and short, good for curriers to dresse their skins and make leather white. The seed or graine thereof resembles Lentils: and being ripe, it is red, and commonly with the grape. The which is called Rhus or Sumach, euen as the tree: a necessarie fruit for many medicines.

CHAP. VII.

¶ Of the Egyptian and Cyprian Sycomores or Fig-trees.

IN Egypt likewise there be found many trees which grow not elf-where: and principally the Sycomore, which thereupon is called the Egyptian Fig-tree. The tree for leafe, bignesse, and **D** barke, is like vnto the Mulberry tree. It beareth fruit not vpon the branches, but out of the very body of the stocke. And the same is a passing sweet fig, but without any grains at all within. It doth increase in exceeding great abundance, so it be scraped and clawed onlv with yron hooks: for otherwise it will not ripen. Come then foure daies after to gather it, you shall not misse but find it ripe, and new coming vp in the place. Thus in euery summer you shall haue a 7 fold increase, and the same in much plenty, yeelding also great abundance of milke. And say that you do not vse the scraping or paring aboue named, yet shal you be sure of 4 fruits in a summer, one vnder another, but so as the new wil driue the old before it, and cause it to shed (and fall) before it be well ripe, for want of that handling before said. The timber of this tree is counted right **E** good and profitable, hauing one singular property by it self. No footer is it hewed; but presently it is cast into standing pooles, and there drowned. This is the only way to season, and dry it. At the first (I say) it sinks downe to the bottom: but afterwards it begins to float aboue: & without all question, the water which vseth to tower and drench all other trees, foleth and sucks forth the sap and humidity of this wood. Now when it begins once to swim aloft, it is a signe that it hath the full seasoning, and is good for building and other workes.

Like to this Sycomore in some sort is a certaine tree in Candy, which is called the Cyprian fig-tree. For this likewise beareth fruit coming out at the very stock, or the maine armes and boughes thereof, when they be growne to any thicknesse: but it puts forth certain spries without any leaues at all, and they resemble roots. Now this tree is in body much like to the Poplar, but in leafe, to the Elm. It beareth fruit foure times a yere, and as often doth it bud. But the green figs will hang so still and neuer ripen, vnlesse they be scarified and skiced so, as the milky substance may run out. The fruit within, is made like a fig, and hath the same pleasant tast: but it is no bigger than the Soruis.

CHAP. VIII.

¶ Of the cod or fruit called *Ceraunia Siliqua* [*i. Carob.*]

THere is a kind of coddie shrub which the Ionians call *Ceraunia*, not vnlike to the Egyptian Sycomore abouefaid, for the fruit thereof comes likewise forth of the stock, but yet is contained within a cod : and thereupon it is that some haue called it the Egyptian fig tree, but they are grossly deceived : for it doth not so much as grow in Egypt, but in Syria and Ionia, also about Gnidos and Rhodes. The tree hath green leaues all the yeare long : it putteth forth white floures of a strong smell. From the root there spring shoots, and about the foot of the tree it bears many yong imps, which are such suckers of the sap, that they draw away all the goodnesse, and rob the parts aboue of their nourishment, whereby the head is yellow, and nothing fresh and green, but fadeth in the top. The fruit of the former yere is gathered about the rising of the Dog-star the yeare following : and then presently it brings forth new. Afterwards commeth a blossome, and the fruit thrieth and waxeth all Winter, vntill the occultation of Arcturus.

CHAP. IX.

¶ Of a tree in Egypt called *Persica* : of *Cucus*, and the Egyptian thorne *Acacia*.

THere is found in Egypt a certain kind of tree by it self called *Persica*, like to a peare tree, but that it is green all the yeare long, and sheds not the leaues : also it beareth fruit continually ; for gather to day, and ye shall find new to morrow growing forth of the place. The fruit is ripe about the Canicular daies when the Etesian winds do blow. It resembleth a Peare, saue that it is longer, and inclosed with a shel or green husk like the Almond : but where the Almond hath an hard shell without as a nut, this is soft in manner of a peare or plum, containing the stone within : and yet it differs somewhat both in shortnesse and tendernesse. The fruit is very good meat : and although the exceeding sweetnesse thereof entice one to eat still and not giue ouer, yet no danger of surfeit ensueth thereupon. As touching the wood of this tree, it is durable, hard, strong, and black withall, in which respects it resembles the Lote-wood very much. They vsed in times past to make images and statues thereof, nor so beautifull altogether, nor of so fine a grain as some others ; but for the timber thereof, which continueth sure and lasteth long, as that of the tree which we called *Balanus*. Much whereof growes curbed and crooked, and therefore is good only for shipwrights to make keels. But contrariwise, the wood of *Cucus* is highly esteemed.

A tree this is not vnlike to the Date tree, in this regard especially, that the leaues be good to twist and plait for mats & such like : herein is the difference, for that it spreads into arms and great boughs. The fruit which it beareth is as much as a man may well hold in his hand, of colour reddish or deep shining yellow, and the taste very commendable ; for it yeelds a iuice between foure and sweet, and therefore wholesome for the stomacke. The woody stone within is great, massie, and exceeding hard, whereof they vse to turne for curtain rings and saile pullies. In the belly of it there lieth a sweet kernell whiles it is fresh and new. But if it be once dried it passeth for hardnesse, in so much as no tooth can chew it, vnlesse it be steeped in some liquor many daies before. As for the wood and timber of the tree, it hath a most dainty, fine, and curled grain, in which regard the Persians set much store by it.

In the same country there growes a thorny plant which the inhabitants make great account of : and especially that which is in colour black, because it will abide the water, & neuer rot nor putrifie in it, and therefore excellent good for the ribs & sides of ships. As for the white thorn of this kind it will soon corrupt and be rotten. But both the one and the other is full of prickes euen to the very leaues. The seed lies in certain cods or husks, wherewith curriers vse to dresse their leather in stead of galls. The floure this thorne beareth is beautifull, whereof folke make faire garlands and chaplets ; profitable also besides and good for many medicines. Out of the barke of this tree there comes a gum likewise. But the chiefeft commoditie and profit that it yeeldeth is this, Cut it down when you please, it wil be a big tree againe within three yerres. It groweth

A groweth plentifully about Thebes in Egypt, among Okes, Oliues, & Peach trees, for the space of 300 stadia from Nilus : where the whole tract is all woods and Forrests, and nathelesse well watered with fountains and springs among.

CHAP. X.

¶ Of the Egyptian Plum tree, and other trees about Memphis.

IN those quarters groweth likewise the Egyptian Plum tree, not vnlike to the thorn of *Acacia* next before described : and this brings forth a fruit as big as a Medler, which neuer is ripe before mid-winter, when the daies be at shortest. The tree is alwaies greene, and sheds not the leaues all the yeare long. Within the fruit afore said there is a big stone ; but the substance otherwise and body thereof is naturally so good, and so plenteous withall, that the inhabitants make their haruest of it. When they haue gathered it, they clense it, stampe it, make it vp into balls and lumps, which they preserve and keepe. The country about Memphis in times past was all woody and full of Forrests, wherein grew so mighty big trees, that 3 men were not able to fathom them about. But among the rest there was one by it self most wonderfull, not for any strange fruit that it bare, nor yet for any singular vse and employment ; but in regard of an accident obserued in it, and a special qualitie that it had. For the tree (forsooth) outwardly resembleth a thorn, but the leaues are made directly like feathers. Let a man shake the boughs neuer so little, shed they will and fall incontinently, but soon after there spring vp new in their steads.

CHAP. XI.

¶ Sundry sorts of Gum. Also of the Cane Papyrus.

THe best gum in all mens iudgement is that which comes of the Egyptian thorne *Acacia*, hauing veins within of checker work, or trailed like wormes, of colour greenish, & cleere withall, without any pieces of the bark intermingled among, and sticking to the teeth as a man cheweth it. A pound thereof is commonly sold at Rome for three deniers. The gumme that issueth from the bitter Almond trees and Cherry trees is not so good : but the worst of all is that which the Plum tree yeeldeth. There runneth likewise out of vines a certaine gum that is passing good for the bleache, scabs, and scals in little children. And otherwhiles ye shall find some in Oliue trees, and that cureth the tooth-ache. Moreouer, the Elme growing vpon *Corycus*, a mountain in Cilicia, and the Iuniper there, haue a gum, but good for nothing. As for that of the Elme it breeds gnats there. Moreouer, of *Sarcocolla* [a tree so called] there distilleth a gum of that name, which Painters and Physitions both haue great vse of. Like it is to *Manna Thuris*, which is the powder of Incense : and therefore the white is better than the red. Sold it is at the same price that the other aboue named. And thus much concerning the trees growing vpon mountains and plains.

Now albeit we are not entred yet into the treatise of those plants and shrubs which grow either in marsh grounds or by riuers sides ; yet before we depart out of Egypt we must not forget the plant *Papyrus*, but describe the nature thereof, considering, that all ciuilitie of this our life, the memoriall and immortalitie also of men after death, consists specially in paper which is made thereof. *M. Varro* writes, that the first inuention of making paper was denised vpon the conquest of Egypt, achieved by *Alexander* the Great, at what time as he founded the city *Alexandria* in Egypt, where such paper was first made. For before that time there was no vse at all (saith he) of paper, but men vsed to write in Date tree leaues first, and afterwards in the dibos and banks of certain trees. Then in proceesse of time they began to register publique records in rolls and sheets of lead : and soon after priuate persons set downe their owne affaires in linnen books, or els in tables couered with wax. For we read in *Homer*, that before the war of *Troy* writing tables were vsed. And at the very time when he wrote, Egypt was not all continent & firr land, as now it is. For, as he saith, all the *Papyrus* whereof paper is made, grew in that branch or arm of Nilus, which answereth onely to the tract or territorie within the iurisdiction *Sebennitis* : but afterward that part also was laid to Egypt, by the shelves and banks made with the inuincation of the said riuer. For, from the Island *Pharos*, which now ioineth close vnto *Alexandria*,

dria by a bridge or narrow causey between, it was a day & nights falling with a good fore wind G
at the pouer, to the main land, as *Homer* hath reported. But afterwards, as *Varro* hath written, by
occasion of a certaine enuious strife and emulation which arose betwene one of the *Ptolomees*:
K. of Egypt, and *Eumenes* K. of Pergamus, about the erecting of their great libraries; when *Pto-*
lomeus suppressed and kept in all the paper made in Egypt, there was parchment deuised by the
said *Eumenes* to be wrought at Pergamus of skins. And finally, the vse was commonly taken vp
of both, to wit Paper and Parchment, which continues the perpetuities and euermore remem-
brance of men and their affaires. But to returne vnto our plant Papyrus, it grows in the mari-
shes of Egypt, or els in the dead standing waters of Nilus; namely in certaine plasches and pits
whereas the water did ouerflow, and remained still after the riuer was fallen and down againe:
and namely such holes and ditches which are not about two cubits deep. The root is wrythen H
and crooked, of the thicknes of a mans arme: & the scape or stalk that riseth from it hath three
sides with 3 corners trianglewise, not about 10 cubits in height, growing taper-wise, small and
sharp in the top, where it beareth an head inclosed and round, in maner of a cabbage. Howbeit
no seed it carrieth within, neither serues the floure for any purpose but onely for chaplets to a-
dorne the images of the gods. The inhabitants of Egypt do vse the root in stead of wood, not
for fuel only, but also to make thereof sundry vessels and vensils in an house. The very bodie
and pole of the Papyr it selfe serueth very well to twist and weaue therewith little boats, and
the rinds thereof be good to make saile-clothes, curtains, mats, and couerlets, clothes also for han-
gings, and ropes. Nay, they vse to chew and eat it both raw and sodden: but they swallow the
iuce only down the throat, and spit out the grosse substance. Moreover, there is Papyrus found I
in Syria, about that very lake and meere whereas the sweet Calamus about named grows. Nei-
ther vsed king *Antigonus* any other ropes about the tackling of his ships, but such as were made
hereof. For as yet the vse of Spartum was not common. Moreover, it is not long since that there
was found growing in Euphrates about Babylon, this plant Papyrus, and knowne to serue for
paper as well as the other in Egypt. And yet for all that, the Parthians will not leaue their old
custome to weaue and purfle letters in their cloathes, after the maner of embroidery. Now
touching the writing paper made of Papyrus: after they haue cut it into certaine trunks, as
long or as short as the size of their paper, they diuide or slice it with the point of a needle or
bodkin for the purpose, into very thin plates or leaues, but they driue them as broad and large K
as possibly they can.

CHAP. XII.

Of diuers kinds of Paper, and how writing Paper is made: also the triall of good or bad
Paper: and the glue or past belonging thereto.

The best sheets or leaues of paper be those which are set out of the very midst or heart of
the stem or stalk of Papyrus: and so consequently better or worse, according as they be
nearer or farther from it. In ancient time the principall paper and the largest was called
Hieratica, [i. sacred or holy] as being employed only about religious and diuine books. But af-
terwards the flatterers of the Emperor *Augustus* named those of the best sort *Augustæ*: like as
the second *Liuiæ*, after the name of his wife. And hereupon it came that the paper Hieratica
waister in a third ranke. Next to them in goodnesse was reputed the paper Amphitheatrike,
which name was given vnto it of the place where it was made. The polishing and trimming of
this paper *Fannius* undertooke, who set up a shop in Rome for the selling of it: and so skillfull
was he and curious in the handling and dressing thereof, that by the time hee had done withall
and brought it to a perfect finenesse, hee made the same of a course and common paper, to be
royall, & fit for the best persons that should vse it: in such sort, as there was none in any request
to speake of, but it: and called after his name it was *Fanniana*. As for that which passed not thro-
row his hands, nor had his workmanship, it retained still the old bare name Amphitheatrike. M
After this kind of paper followed that which they called *Saitica*, of a towne or city in Egypt,
where great abundance was made thereof of the courser pieces and refuse of the said Papyrus.
And yet there was another paper, to wit *Taniotica*, so called of a place neere adioyning, made
of the grossest part neere to the bark and outside: and this they sold for the weight and another
goodnesse that it had besides. As for the merchant Paper or shop-paper, called *Emporetica*, it
was

A was not for to write in, onely it serued as wast Paper for sarples to wrap and packe vp wares in:
also for coffins or coronets to lap spice and fruits in, and thereupon merchants and occupiers
gaue it that name. And with this, the very cane it selfe is to be seene clad outwardly: and the vt-
gaue it that name. And with this, the very cane it selfe is to be seene clad outwardly: and the vt-
most coat thereof is like to a reed or bulrush, fit for no purpose but to make cordage of: and not
very good for that vse neither, vnlesse it be for the water only, which it wil abide very wel. Now
the making of all these Papers, was in this sort, namely, vpon a broad bord wet with the cleare
water of Nilus. For the fatty and muddie liquor therof serues in stead of glew, wherewith at the
first the thin leafe of the cane Papyrus, sliced from the rest, and laid vpon the board to the full
length (in manner of the warpe) according as the trunk will giue leaue, being cut off at both
ends, namely, toward the top and the root, is wet and besmeared: then is there another laid ouer-
B thwart it, after the order of the woofe, with a crosse graine to the other: and so is the web (as it
were) of the Paper performed. Pressed afterwards it is in certaine presses, that both leaues may
stick together: and then the whole sheets are dried in the Sun. Which done, they be so cou-
ched together, that the best and largest lie first, and so consequently in order as they be worse
and of lesse size, vntill you come to the worst. And one scape or trunk lightly of the cane Pa-
pyrus, yeelds not about 20 such sheets. Great difference there is in them for the breadth, nor
pyrus, yeelds not about 20 such sheets. Great difference there is in them for the breadth, nor
withstanding the length be all one. The best, namely which were taken out of the heart of the
cane, beare 13 fingers in breadth. The Hieratica Paper wants two of that number. The Fannian
is but ten fingers broad. The common Paper Amphitheatrike, but nine. *Saitica* yet fewer, and
will not beare the stroke of the hammer. And as for the merchants Paper, it was so short and
C narrow, that it went not about six fingers. Moreover, in Paper these 4 things must be confide-
red, that it be fine, well compact, white, and smooth. Howbeit, *Claudius Caesar* the Emperor abar-
red, that it be fine, well compact, white, and smooth. Howbeit, *Claudius Caesar* the Emperor abar-
ted the credite of the Paper *Augustæ*, that it was no more accounted the best: for indeed so thin
it was, that it would not abide the dent of the pen: besides, it would not hold inke, but shew the
letters on the other side; and was euermore in danger of blurring and blotting, specially on the
back part: and otherwise, vnstightly it was to the eie, for that a man might so easily see thorough
it. And therefore he deuised to fortifie and strengthen the said Paper, and laid another course
or coat (as it were) ouer the former, in manner of a double woofe. Hee enlarged also the breadth
of the Paper: for he caused it to be a foot broad, yea, and some a foot and an halfe, I meane that
kind which was called *Macrocola*, or large Roiall Paper. But herein was a fault, and reason found
D it out: for if one leafe of this large Paper were plucked off, the more pages took harme thereby,
and were lost. And therefore the former *Claudian* Paper, which had but 3 leaues of Papyrus, was
preferred before all the rest. Howbeit, that which was named *Augustane* bare the name for let-
ters misseue, and the *Liuiane* continued still in the owne credite, hauing no property of the first
and principall, but all in a second degree. The roughnesse of Paper is polished and smoothed
either with some tooth, or else with a Porcellane shell: but the letters in such slick Paper, will
soone fade and decay. For by polishing, it will not receiue the inke so deepe as when it is not
smoothed, although otherwise it will shine the better. Moreover, it falls out many times, that
if the humor be not artificially laid, the Paper is very stubborn: but this fault is soon found out
at the very first stroke of the hammer, or else discovered by the smell, especially if good heed
E were not taken in the tempering therof. As for the spots and speckles, the eie will quickly spie
them: but the long streaks, and veines lying close couched between the pasted places, can hard-
ly be discerned before that the letter runs abroad, and shewes how in the spongeous substance
of the Paper wanting that past, the ink will sinke thorough, and make blots, so deceitfull is the
making of this Paper. What remedie then? but to be at a second labor to past it new againe a-
nother way, to wit, with the common past that wee vse, made with the finest floure of wheat, and
tempered with hote scalding water, and a little vinegre mingled therewith. For the joiners glue
and that made of gums, is brittle, and will not abide the rolling vp of these sheets into quiers:
But they that wil go more surely to work, and make an exquisite past indeed, boile the soft and
tender crums or leaue bread in scalding water, and then let it run thorough a strainer, which
F they vse to this purpose. For besides that the Paper hereby will be more firme, and haue lesse
flawes, it surmounts also in sweetnesse the water of Nilus. Moreover, all kind of past whatsoe-
uer for this effect, ought neither to be staler than a day old, nor yet fresher and vnder that age.
After that it is thus pasted, they beat it thin with the hammer: and a second time runne lightly
ouer with new past: and then being thus knit & bound fast again, it is made smooth and void of
wrinkles.

wrinkles, and finally beaten euen with the hammer, and driuen out in length and breadth. After this manner was that Paper made, wherein were written the bookes and records of the two *Gracchi*, *Tiberius* and *Caius*, with their owne hands, long agoe: the which I saw in the house of *Pomponius Secundus*, a noble citizen of Rome, and a renowned Poet, almost two hundred yeares after their death. As for the writings of *Cicero*, of *Augustus* late Emperour of famous memorie, and of *Virgill*, we daily see and handle them, by the meanes of Paper so good and durable.

CHAP. XIII.

¶ Of the bookes of *Numa*.

WE find many examples in stories, which very directly and mightily do testifie against *M. Varro*, as touching Papers. For *Cassius Hemina* (a most faithfull and ancient writer) in the fourth booke of his *Annales*, hath reported, That one * *Cn. Terentius* a scribe or publicke Notarie, as he digged and delued in a ground which he had neare to *Ianiculum*, light vpon a chist, wherein lay the bodie of *Numa*, sometime king of Rome. In the same also were found the bookes of the said king. And (as he affirmeth) this happened in that yeare, when *Pub. Cornelius* the sonne of *Lucius*, surnamed *Cethegus*, and *M. Babius* sonne of *Quintus*, surnamed *Pamphilus*, were Consuls of Rome: betwene which time and the raigne of *Numa*, by iust computation are reckoned 535 yeres. He saith moreover, That those bookes were made of the Paper abouenamed. The greater wonder it was, how such kind of bookes should last so long, especially within the earth, and not putrifie? The thing therefore being so strange, and in manner miraculous, that Paper should continue all that time, I think it not amisse to set down the very words of *Hemina* likewise, as he deliuereth them. The world made a wonder (quoth he) how these bookes could possibly endure so many yeres? but the party who found them yielded this reason: That within the said coffer about the mids of it, there was a stone foure-square: lapped all about and bound euery way with [waxe] candles in manner of a sercloth: vpon which stone, the foresaid bookes were laid: and therefore it was (as he supposed) that they did not rot. Moreover, the bookes also were embaulmed with the rosin or oile of Cedar, which might be a good reason in his conceit, that the moths came not to them. Now these bookes contained the Philosophie and doctrine of *Pythagoras*: and for that they treated of that Philosophical argument, burnt they were, by order from *Q. Petilius* the Pretor for that time being. The same storie in effect doth *C. Piso Censorinus* (a man who had been Censor) report in the first booke of his commentaries: howbeit, he setteth downe their number withall, and saith they were foureteen in all, whereof seuen treated of the Pontificall law, and matters of religion; and as many discoursed of *Pythagoras* his Philosophie. But *Tuditanus* in the thirteenth booke of the *Annales* affirmeth, That they were the decretals only of *Numa*, and contained his ordinances. As for *Varro* himselfe, he writeth in the fift booke of *Humane Antiquities*, that they were in all but twelue. And *Attilius* in his second booke reporteth, That two of them were written in Latine, and contained the Pontificall diuinitie and church-matters: and other twaine penned in Greeke, were full of precepts in Philosophie. He also affirmes in his third booke, for what cause the said bookes by vertue of a publicke decree were consumed with fire. But all Historiographers agree in this, That one of the *Sibyls* brought vnto *Tarquinius* the proud three bookes: of which, two were burnt by her owne selfe: and the third likewise perished with fire, together with the Capitol, during the troubles of *Sylla*. Ouer and besides, *Mutianus*, a man who had been thrice Consul of Rome, hath left on record, that of late, while he was lord gouernor of Lycia, he read in a certain temple an Epistle written by prince *Sarpedon* in Paper, and bearing date from Troy. And I wonder the rather at this, if so be that when *Homer* liued and wrote his Poeme, there was no land of Egypt as now there is: or why, in case there was such vse of Paper then, himself should write, that in the very same Lycia, *Bellerophon* had writing tables giuen him to deliuer as touching his owne death, and not rather letters missewrote in Paper? Wel, howeuer that be, this is certaine, that there is a scarfitie of otherwhiles of Paper also, as well as of other commodities: and this cane or reed Papyrus doth many times faile. For not long since, euen in the daies of *Tiberius* the Emperour, in a dearth and want of Paper, there were commissioners deputed and appointed by the Senat of Rome, for the dispensing and distribution of it among the people: otherwise there had been a great mutinie, and tumult at Rome about Paper.

CHAP.

CHAP. XIII.

¶ Of the trees in *Aethiopia*.

AS touching *Aethiopia*, and namely that quarter which confineth vpon Egypt, it hath in manner no trees at all of any name, saue those that beare wooll or cotton, concerning the nature of which trees, we haue sufficiently spoken in the description of the Indians, and of Arabia: and yet in very truth, the cotton that is brought from these trees in *Aethiopia*, comes neerer to wooll than any thing els; howeuer the trees be otherwise like to the rest of that kinde: and the burse or eod wherein this woollie substance lyes, is greater, and as big as a Pomegranate. Besides these, there be Date trees also, like to such as we haue before described. As touching other trees, and especially the odoriferous woods within the Isles that lie vpon *Aethiopia* round about, we haue said enough in the treatise of those Isles.

CHAP. XV.

¶ Of the trees growing in mount Atlas: of Citron tables: of the commendable perfections, and contrariwise of the defaults thereof.

THe mountaine Atlas (by report) hath a wood in it of peculiar trees that elsewhere grow not, whereof we haue already written. The Mores that border vpon it, are stored with abundance of Citron trees: from whence commeth that excessive expence and superfluitie about Citron tables made thereof. And our dames and wiuers at home (by way of reuenge) vse to twit vs their husbands therewith, when we would seem to find fault with the costly pearls that they do weare. There is at this day to be seen a board of Citron wood, belonging sometimes to *M. Tullius Cicero*, which cost him ten thousand Sesterces: a strange matter, considering hee was no rich man: but more wonderful, if we call to mind the seueritie of that age wherein hee liued. Much speech there is besides of *Gallus Asinius* his table, sold for eleuen thousand Sesterces. Moreover, there are two other, which *K. Iuba* sold: the one was prized at 15000 Sesterces, and the other held little vnder. Not long since, there was one of them chanced to be burnt, and it came with other household stuff but from the cottages in Mauritania, which cost 140000 Sesterces: a good round summe of money, and the price of a faire lordship, if a man would be at the cost to purchase lands so deer. But the fairest and largest table of Citron wood, that to this day hath bene scene, came from *Prothomae* king of Mauritania, the which was made of two demie-rounds or halfe circles, joined together so artificially, that for the closeness of the joint (which could not be discern'd) it was more admirable than possibly it could haue been if it had been naturally of one entire peece: the diameter of it caried foure foot and a halfe, and three inches thicke it was. Likewise another such table there was, surnamed *Nomien*, of one *Nomius* a slave, enfranchised by *Tiberius* the Emperour: the square or diametre whereof, was foure foot within 3 quarters of an inch, and the thickenesse halfe a foot lacking so much. And here I cannot forget and ouerpasse, how that the Emperour *Tiberius* himselfe had a table, which being two inches and three quarters about 4 foot in the diametre, and an inch and an half thicke throughout, he caused to be plated all ouer, for that *Nomius* his freed-servant had one so rich and magnificent, made altogether of a knot: a knot (I say) or a knur in the root of the tree, which is the very beantie of the wood, and giues all the grace to tables made thereof; and namely, if this knot lie altogether within ground, it is without comparison excellent, and farre more rare and singular than any of the timber aboue, either in the trunk and bodie, or in the armes and boughes of the tree. So that (to say a truth) this costly ware bought so deare, is no better than the superfluous excrecence of trees: the largeness whereof, as also of their roots, may be esteemed by the roundnesse that they carie. Now are these Citron trees much like to the female Cypresse (especially that of the wild kind) in leaf, in smel, and in body. A mountaine there is in high Mauritania, called *Anchorarius*, which was wont to yeeld the best and fairest citron trees, although now it be naked and despoiled of them. But to returne to our tables aforesaid; the principall be they which are either crisped in the length of the vein, or beset here and there with winding spots. In the former, the wood curleth in and out along the graine, and therefore such bee named *Tigrinæ*, [i. Tigre-tables.] In the other, there be represented sundrie tufts as it were enfolded

folded and enwrapped round, and those they call Pantherina, [*i. Panther or Luzerne tables.*] There be againe, whereof the worke in wainescot resembleth the waues of the sea: and the better grace they haue, and be more esteemed, if they make a shew of the eyes appearing in Peacocks tailes. Next in account and request to these abouenamed, be those that are frilled with small spots standing thicke, as if many graines were gathered together, which they call thereupon (of some resemblance of little bees or flies) *Apiata*, as if they were speckled & filed with their dung. But be the worke and graine of the wood what it will, the color makes all. Here at Rome we see most store by that colour which is like to mead or honied wine, shining and glittering in the veins of the wood. After which considerations, men regard much the breadth & largenes of the whole plank, standing of one entire peece which makes the table. Some take a great pleasure to see in one Citron board many of those faults which be incident to trees, to wit, the Lignum, for so they call the simple, plain, and bare wood and timber without any branched or curled graine at all, without a shining iustre and glittering glosse, without worke to be seen in any order digested, or at the most (if any be) representing the leaues of a Plane tree. Again, the resemblance either of the vein or color of a kind of Oke wood called *Ilex*. Moreover, the rifts and chinks which timber is subiect vnto, by reason principally of wind and Suns heat: or else hairie streakes that be like to such cliffs and creuisses. Afterwards men were delighted with a kind of Lamprey veine trauesing and running ouer a black crosse way: and with an outward skin or coat marked with speckes or knottie knurs, like to Poppie heads: and generally with a color all ouer, comming neer to black, or at leastwise bespotted with sundrie colors. The Barbarians for to season the wood of this Citron tree, use to burie the green boards or planks thereof within the ground, and besmeare them all ouer with wax. But the artificers and workmen do put them for 7 daies within heaps of corne, and stay 7 daies more ere they be wrought: & a wonder it is incredible, how much of the weight the wood loses by this means. Moreover, of late daies we haue found the experience by shipwracks, that this timber also wil by nothing in the world be sooner dried nor hardened to last a long time without corruption, than by seawater. Howbeit, to maintaine these tables best, and to cause them for to shine bright, the way is to rub them with a drie hand, especially after that a man is newly come out of the baines or hot house. Neither catch they any harme or staine, if wine be spilt thereupon: so as it should seeme they were naturally made for wine. To conclude, a tree this is seruing for the ornaments of this life, and the trim furniture of our house, few or none like to it: and therefore me thinks I do not amisse to continue the discourse thereof somewhat longer than ordinarie.

CHAP. XVI.

¶ Of the tree *Thya*, what it is.

WELL knowne vnto *Homer* was this tree, which in Greeke is named * *οἶνον*, but some call it *Thya*: for among other daintie odors and sweet woods, he reports, That dame *Circe* (whom he would haue to be reputed as a goddesse) burnt of this *Thyon*. And therefore much deceived are they, who vnderstand by that word *Thyon*, perfumes and odoriferous spice, considering that in one and the very same verse, the Poet maketh mention of the Cedar and Larch tree together with *Thyon*, whereby it appeareth plaine, that he spake of trees onely. *Theophrastus*, who after the daies of *Alexander* the Great, was the first that wrote the historie of those acts which happened about the 440 yeare from the foundation of Rome, gaue great honour euen then to this Tree, and reported, That all carpenters worke of temples in old time, was made of the same; as of a timber cuerlasting, and which in rouses would continue without all putrefaction and corruption whatsoever. Moreover, he writeth, That the wood of the root is so curled and frilled, as none more; and that of no timber besides are more curious peeces of works made, nor of greater price. Ouer and besides, he saith, That the fairest and goodliest trees of this kind, doe grow about the temple of *Iupiter Hammon*: and some of them also within the country *Cyrenaica* toward the inland parts. But all this while not a word of the fore-said costly tables speakes he in his whole history: and verily before that of *Cicero*s, there is no record in writers of any such tables: whereby it appeareth, that they be come vp but of late daies. Another tree there is likewise of that name, bearing an apple or fruit, which some cannot abide for the strong fauor and bitternes withall, others again like and loue it as well. This tree also beautifieth and setteth out the house, but I purpose not to bestow many more words thereof.

CHAP.

CHAP. XVII.

¶ Of the tree *Lotus*.

IN the same coast of Africk which regards Italy there growes *Lotos*, which they call *Celtis*. A notable tree it is and of speciall marke: found also here among vs now in Italy, but together with the soile it hath changed the nature. The fairest and goodliest of them be about the Syrtis and the Nasamones: they be as big and tall as Peare trees, howsoeuer *Nepos Cornelius* saith they are but little and low. The leaues be thick cut and indented: otherwise they are like to those of the *Ilex* or Holme tree. Many sorts there be of the *Lote* tree, and those for the most part according to their diuers and seuerall fruits. Howbeit ordinarily the fruit is as big as a bean, and of yellow colour as *Saffron*; yet before it is full ripe it changeth into sundry colors like as grapes do. It growes thick among the branches of the tree in manner of myrtle berries, and not like to the cherries in Italy: and in those plants aboue named the meat thereof is so sweet and pleasant, that it hath giuen the name both to a nation and country, in so much as the people be called *Lotophagi*: and withall, so welcome be all strangers thither, and so well contented with their entertainment, that they forget their owne native soile, for the loue they haue to this fruit when they haue once taken to it. By report, who so eats thereof is free from the diseases of the belly. This fruit is counted the better which hath no kernell within: for there is another kind wherein the said kernell seems as hard as a bone. Moreover, out of this fruit there is prest a wine like to *Mede*, which the aboue named *Nepos* saith will not last about ten daies: who reporteth besides, that the inhabitants do stamp the berries thereof with wheat or frumentie into a past, and so put it vp in great barrels or such like vessels for the prouision of their food. Moreover, we haue heard say that whole armies passing to and fro through Africke, haue fed thereof and had no other meat: the wood is blacke of colour, and much sought for it is to make pipes and fises: of the root whereof hafts of daggers and kniues be made, besides other pretty deuises of small use. Thus much as touching the nature of the *Lote* tree in those parts: for there is an herb also of that name [called *Melilote*.] As for the Egyptian *Lotus* it is a plant bearing a stalke, and growes in the marshes of Egypt: for when the waters of *Nilus* are fallen which drench the country, this plant comes vp in the flat and waterie leuell along the riuer, with a stem like to the [Egyptian] bean, with leaues thrust close and thick together, howbeit shorter and lesse than those of the bean: in the top of which stalk it bears fruit in manner of an head, for cuts and chamfers and euery thing els like those of Poppy: within which be contained certain grains or seeds resembling *Miller*. The inhabitants of that country do pile together in heaps those heads, and so let them putrifie: afterwards they separate them, wash them faire, and when they be dry, stamp and mold them, and thereof make their bread. A strange and wonderful thing it is that is reported besides, namely, That when the Sun goes down, those heads close vp and be couered with leaues, and remaine shut vntill the morning, at what time they open againe: and thus continue this course vntill they be ripe, and that the floure which is white doth fall of it selfe.

CHAP. XVIII.

¶ Of the very stalke, scape or stem, and root of *Lotus*.

IT is said moreover as touching this Egyptian *Lotus*, That in *Euphrates* the very head of the stalk together with the floure, yfeth in the euening to be plunged & drowned vnder the water vntill midnight, and so deep to settle toward the bottom, that a man with his hand cannot reach thereto, nor find any part of it: but after that time it begins to rise by little and little, and by Sun-rising appeares aboue water and opens the floure, and still mounteth higher and higher a good height from the water. This *Lotos* hath a root as big as a Quince, couered with a black rinde or barke much like to the huske of a Chestnut. The substance within is white and delectable to eat, but more pleasant being either foddin in water, or roasted vnder embers, than raw: and Hogs will feed fat with nothing better, than with the pills and parings of this root.

Mm

CHAP.

CHAP. XXI.

¶ Of *Paliurus*, the *Pomegranate*, and the *floure of the Pomegranat*.

THe region of Cyrenaica in Africk makes more account of their *Paliurus* than of *Lotus*: for the *Paliurus* shoots forth more twigs and branches, and hath a redder fruit than the *Lotus*: besides, the fruit and the kernell be eaten apart; and in truth pleasant it is of it selfe alone, but more pleasant with wine; yea, and the iuice thereof giueth a better tast to wine if it be put into it. The inland parts of Africk, as far as to the *Garamants* and the desarts, be wel planted with *Dare trees* faire and great, bearing goodly and pleasant dates, and those especialy in that quarter of Barbary which lieth about the temple of *Iupiter Hammon*. But the territorie of Carthage challengeth to it selfe the *Punick apple*: some call it the *Pomegranat*, & they haue made feuerall kinds thereof, calling that *Apyrinon*, which hath nowoody or hard kernell within: and indeed these *pomegranats* are naturally more white, the graines within more pleasant, and diuided with membranes and pellicles between, nothing so bitter as the other: for in both sorts they be framed and fashioned within like to hony combs. As for those *pomegranats* which haue such kernells or stones, there be siue kinds of them, to wit, sweet, soure, temperat between both, *typtick* or austere, and tasting of wine. But the *pomegranats* of *Samos* and *Egypt* haue this difference one from another, That some haue red floures on the head, and are therefore called *Erythrocoma*: others are white, and such they name *Leucocoma*. The rind of soure *pomegranats* is better for tanners and curriers to dresse their leather with, than of the rest. The floure is called *Balisteum*, both medicinable and also good for to dyt cloth: and hereof cometh the colour of *Punicus* [i. a light red, or a bay] taking the name of the apple *Punicke*, or *Pomegranat*.

CHAP. XX.

¶ Of the *Shrubs in Asia and Greece*.

IN Asia & Greece there grow certain shrubs, to wit, *Epipactis*, which some call *Elleborine*, with small leaues, which being taken in drink are good against poyson, like as the leaues of *Erice* [i. Heath or Lings] withstand the stinging of serpents.

CHAP. XXI.

¶ Of *Thimelaa* or *Chamelaa*, *Tragacanth*: of *Tragium* or *Scorpio*. Also of *Myrice*, *Brya*, and *Galla*.

THe shrub or bush which beares the graine *Gnidium*, that some call *Linum*, is after some writers named *Thymelaa*, according to others *Chamelaa*: there be that call it *Pyrosachne*: some again giue it the name of *Cneston*, others of *Cneoros*. This plant howsoeuer it be named resembleth the wild *Oliue*, but that the leaues be narrower and gummy to the teeth, if a man bite them: for height and bignesse answerable to the myrtle: the seed thereof is for colour and fashion like to the grain of wheat, and serueth only for physicke.

As touching the plant *Tragium*, it is to be found in the *Ile Candy* onely. It hath a resemblance of the *Terebinth*, like as the seed also, which, by report, is most excellent and effectually to heale wounds made by darts and arrowes. The same *Ile* hath the bush *Tragacanth* growing in it, the root whereof is like to that of *Bedegnar*: and the same *Tragacanth* is much preferred before that which grows either in *Media* or *Achaia*. A pound of *Tragacanth* is worth 30 deniers Roman. As for the plant *Tragium* or *Scorpio*, it grows likewise in Asia. A kind of bramble or brier it is without any leaues, bearing fruit of berries much like to red grapes, whereof there is good vse in physicke.

Touching *Myrice*, which others call *Tamarix*; and *Achaia Brya* the wilde; Italy brings it forth: this special propertie it hath, that the same kind thereof only, namely that which grows in gardens, beareth fruit like galls. In Syria & Egypt this groweth plenteously, and the wood thereof we cal *Vnhappy*: but the more vnluckie and vnforgotten be those of Greece: for there groweth *Ostrya*, named also *Ostrya*, a solitary tree about watery and moist rocks, hauing barke and

A and branches like to the *Ash*, but *Peare-tree* leaues, saue that they be somewhat longer & thicker, with long cuts or lines wrinkled and riuiled thoroughout: and the seed in forme and color is like to barley. The wood of it is hard and strong: and some say if any peece thereof be brought into an house where a woman is in trauaile of child-birth, she shall haue difficult labour, and hardly be deliuered: and whosoever lyeth sicke there, shall die a miserable death.

CHAP. XXII.

¶ Of *Euonymus* or the *Spindle tree* of *Adrachne*, *Congygria*, and *Thapsia*.

IN the Island *Lesbos*, there groweth a tree named *Euonymos*, no better nor more lucky than *Ostrya* before said. Much vnlike it is not the *Pomegranat* tree. As for the leafe that it beares, it is of a middle size between that of the *Pomegranat* and the *Bay*; otherwise for shape and fastnesse, it resembles that of the *Pomegranat*. The floure is whiter; the smell and tast wherof is pestiferous and menaces present death: it beares cods like to *Sesamaw*, within which be grains or seeds soure square and thick, but deadly vnto all creatures that eat them. The leafe also is as venomous as the graine, yet otherwise the enues therof a fluxe and gurrie of the belly, which saues their life, or else there were no way but one.

Alexander Cornelius called that tree * *Eone*, whereof the famous ship *Argo* was made; and like it was (by his saying) to the *Oke* that carries *Misselto*, the timber whereof neither water will putrifie, nor fire consume, no more than the *Misselto* it selfe. But so far as euer I could learn, no man knew that tree but himselfe.

As for the tree *Adrachne*, all the Greeks in manner take *Porcellaine* for it; whereas indeed *Porcellaine* is an herbe, called in Greeke *Andrachne*; so as they differ in one letter: but *Adrachne* is a tree of the wild Forrests growing vpon mountaines, and neuer in the plaines beneath; resembling the *Arbut* or *Strawberrie tree*, saue that the leaues be lesse, and neuer fade nor fall. And for the barke, rough and rugged indeed it is not, but a man would say it were frozen and all yce round about, so vnpleasant it is to the eye.

Like in leafe to *Adrachne*, is the tree *Congygria*, but otherwise it is lesse and lower. This propertie it hath, To lose the fruit wholly, together with the soft downe that it beareth, which they cal *Pappus*, a qualitie that no other tree hath, beside it. Like to *Adrachne* also is *Apharce*, and beares fruit twice in one yeare, as well as it. The former is ripe, when the grape begins to bud and bloom; the latter, in the beginning of winter: but what manner of fruit this should be, I haue not found written.

As touching the *Ferula*, it will not be amisse to speake thereof among forrain plants, yea and to range it among trees: for (as hereafter we wil distinguish in the diuision of trees) some plants are of this nature, To shew al the wood they haue, where the bark should be; that is to say, without forth: and where the heart of the wood ought to be, they haue nought but a light and spongy pith, as the *Elder*, or else nothing at all, as *Canes* and *Reeds*. But to come to our *Ferula* aboue named, it growes in hot countries beyond-sea, with a stalk or stem full of knotty joints.

E Two kinds be knowne of them: for that which the Greeks call *Marthex*, groweth tall; but *Narthecia* is alwayes low. The leaues that put forth at the joints, be euer biggest toward the ground: this plant otherwise is of the nature of *Dill*, and the fruit is not vnlike. There is not a plant in the world lighter than it for the bigne: being easie therefore to weld and carrie, the stem thereof serueth old men in stead of stauces, to rest vpon. The seed of this *Ferula* or *Fennell-gyant*, some haue called *Thapsia*, but herein they be deceived, for that *Thapsia* doubtlesse is a kind of *Ferula* by it selfe, leaved like *Fennel*, with an hollow stalk, and neuer exceeds in hight the length of a walking staffe: the seed is like to that of the *Ferula*, and the root white: cut it, there issues forth milke; stampe it, you shall see it yeeld plenty of iuice. Neither is the barke of the root rejected and cast aside, although both it, the milke, and the iuice, be very poisons: for surely the root is hurtfull to them that dig it vp, and if neuer so little of the aire therof breath vpon them (so venomous it is) their bodies will holne and swell, their faces will be all ouerun with a wild fire: to prevent which mischises, they are forced to anoint their bodies with a cerot. Howbeit as dangerous as they be, Physicians make vse thereof in the cure of many inward diseases, so they be wel corrected and tempered with other safe medicines. In like maner they say, that the iuice

of Thapsia is singular good for the shedding and falling of the haire; also against the blacke & blew markes remaining after stripes: as if Nature furnished not Physicians sufficiently with other wholsom remedies; but that needs they must haue recourse to such poisonous and mischievous medicines. But this is the cast of them all, to pretend such colourable excuses, for their handling of poisons: and so impudent and shamelesse are some besides, that they bash not to auow the vse of them, bearing vs in hand, that Physick cannot stand without poison. The Thapsia in Affricke is the strongest of all others. Some vse to slit or cut the stem about harvest, and in the very root make an hollow trough to receiue the juice that runs downe, and when it is dried, they take it away. Others againe do bruiſe and stamp in a mortar, both leafe, stalke, and roor, and when the juice that is pressed therefrom, is thoroughly dried in the Sun, they reduce the same into certain Trochisques. *Nero Caesar* the Emperor in the beginning of his Empire, gaue great credit to Thapsia: for vsing (as he did) to be a night-walker, and to make many ryots and much misrule in the darke, he met otherwhiles with those that would so beat him, as that he carried away the marks black and blew in his face: but (as he was subtil & desirous to auoid the speech of the people) an ointment he had made of Thapsia, Frankincense, and Waxe, wherewith hee would anoint his face, and by the next morning come abroad with a cleare skin, and no such marks to be seene; to the great astonishment of all that saw him. To conclude, the Ferula maketh the best matches to keep fire, by all mens confession: and those in Egypt excell the rest, for that purpose.

CHAP. XXIII.

¶ Of Capparis, or Cynobatos, or Ophcostaphyle: and of Sari.

Likewise in Egypt groves Capparis, a shrub of a harder and more woody substance: well knowne for the seed and fruit that it carries, commonly eaten with meats, and for the most part the Capres and the stalke are plucked and gathered together. The outlandish Capres (not growing in Egypt) we must take good heed of and beware: for those of Arabia be pestilentiall and venomous: they of Affricke be hurtfull to the gums, and principally the Marmarice are enemies to the matrice, and breed ventosities. The Apulian Capres cause vomit, and make lubricities both of stomack and belly. Some call the shrub Cynobatos: others Ophcostaphyle. Moreover, there is a plant of shrubs kind, called Sari, it growes along Nilus, almost two cubits high, it beareth an inch in thicknesse, and hath leaues like to Papyr-reed, and men do chew and eat it after the same manner. As touching the roor, it is singular good for Smiths cole to burne in their forges, so hard it is and durable.

CHAP. XXIII.

¶ Of the Royall thorn of Babylon: and of Cytisus.

I May not ouer-passe that plant, which about Babylon is sowed vpon Thornes only: for otherwise it knowes not how to liue no more than Misseleto, but on trees: howbeit this plant that I speake of, is sowed vpon that Thorne alone called the Royall Thorne. And a strange thing it is of this plant, That it springs and grows the very same day that it is set or sowed. Now the seasonable time of sowing it, is at the very rising of the Dog-star: and notwithstanding the Suns heat, right quickly ouerspreads it the tree or shrub, on which it is cast. The Babylonians vse to aromatize their wine therewith; and for that purpose are they so carefull to sow it. But the foresaid Thorne tree groweth also about the long walls of Athens [reaching from the tower to the hauen Pyraeum.]

Moreover, a shrub there is, called Cytisus, highly commended and wondrous much praised by *Aristomachus* the Athenian, for feeding of sheepe; as also for fattening of swine, when it is drie: and he promisseth and assureth, That an acre of land sowed therewith, although it be none of the best soile, but of a meane and ordinarie rent, will yeeld yearly [communibus annis] 2000 Sesterces to the master. As great profit cometh therby, as of the pulse like Vetches, called Ervum: but sooner will a beast be satisfied therewith, and a very little thereof will serue to fat the same: inasmuch as if horses or any such labouring cattell may meet with that prouender, they will not care for barley: neither is there any other grasse or foddere, that yeeldeth more or better milke,

A milk than it: but that which passeth all, the pasturage of Cytisus, preſerueth sheepe, goats, and such like cattell, sound and safe from all diseases whatsoeuer.ouer and besides, if a nourſe want milke, *Aristomachus* prescribes her to take Cytisus dry, and teeth it in water, and so to drink it in wine, wheteby not onely her milke will come againe in great plenty, but the babe that sucketh thereof will be the stronger and taller. He giueth it also to hens and pullein whiles it is green; or steeped and wet if it chance to be dry. *Democritus* and *Aristomachus* both do promise and assure vs, that Bees will neuer miscarry nor faile, if they may meet with Cytisus to feed vpon. And yet there is not a thing of lesse charge to maintaine than it. Sowne it is commonly in the spring with barley, I mean the seed thereof, as they mean to sow Leekes or Porret seed: or els they set plants and slips thereof from the stalke, in Autumne before mid-winter. If the seed be sowne, it ought to be steeped and moistned before: yea, and if there fall no store of raine after it is in the ground, it had need to be watered. As for the plants when they be a cubit long, are replanted in a trench a foot deepe. Otherwhiles the tender quickesets are planted about the Equinoxes, to wit, in mid-March and mid-September. In three yeares they come to their full growth. They vse to cut it downe in the Spring-Equinox, when it hath done flourishing: a worke that a very lad or old woman may do, euen such as can skill of nothing besides. This Cytisus is in outward hew white: and in one word, if a man would pourtray the likenes thereof, it resembleth for all the world a shrub of Trifolie or Clauer-grasse, with narrower leaues. Being thus gathered, it is euer giuen to beasts once in three daies. And in Winter, that which is dried ought to be wet before they haue it. Ten pound of it is a sufficient foddering for an horse: and for other small cattell according to the proportion. But by the way this is not to be omitted, that it is good to set garlicke and sow onions seed betweene the rewes and rankes of Cytisus where it groweth, and they will thriue more plenteously. This shrub was first discovered and known in the Island Cythnus, and from thence translated into all the other Cyclades: and soon after brought to all the cities of Greece; whereupon followed great increase of milke, & plenty of cheefe. I marvel therefore very much that it is so season and rare in Italy: and a plant it is that feareth neither heate nor cold, no iniury of haile, nor offence by snow; and as *Hippocras* saith, it is not afraid so much as of the enemy; the reason is, because the wood thereof is nothing beautifull to the eye.

CHAP. XXV.

¶ Of shrubs and trees growing in our Mediterranean sea, in the red sea, and in the Indian sea.

Even the very sea affordeth shrubs and trees: but those of the Mediterranean sea be far lesse than of other seas; for the red sea and all the Levant Ocean is full of woods. That which the Greeks call *αλγη*, hath no other name in any language. As for Alga, is a word appropriate rather to weeds or sea-herbs, called Reik: but this Phycos is a very shrub, bearing broad leaues of a green colour, which some call Praſon, others Zoister. A second kind there is of Phycos, with an hairy leafe like to Fennell, and groweth vpon rockes. As for the former called Zoister, it is found among the shelues and shallow waters not far from the shore: both the one and the other appeare in the Spring, and be gon in Autumne. That of this kind which groweth in Candy about rockes, is much vsed of dyers for the purple color: and namely on the North part of that Island, and among sponges, for that is most commendable for this purpose. A third sort there is like vnto the grasse called *Coich*, or *Dent-de-chien*, hauing a root full of ioynts, and a stalk likewise in maner of a reed.

Another shrub there is in that sea called Bryon, with leaues like Lettice, saue onely they be more wrinkled and crumpled together: but this growes more inward and farther into the sea. Mary in the deepe groweth both Fir and Oke to the height of a cubit. Among these branches, the Cockles and Muskles, and such like shell fishes do settle and sticke vnto them. As for that kind of sea-Oke, some say it is of good vse to dye wooll withall: as also that it beareth Mast or Acorns in the deepe: the knowledge of all which we come vnto by those that diue into the bottom of the sea, and such as haue suffered shipwracke and escaped. Moreover, by report, there be other exceeding great trees, and namely about Sycione. As for the sea vine it groweth euerie where: but the fig tree there is without leaues, & hath a red bark. There be also date trees found

in the sea, but as little as shrubs. Without *Hercules* pillars, or the streight of Gebraltar, there are shrubs to be seen, bearing leaues resembling leek blades: and others leaued like to the bay tree, or to the herbe Thyme: and both kinds being cast vp a land turne into the pumish stone. But in the East parts it is a wonderous matter to thinke, that so soon as euer a man is past Cop-tus, he shall find nothing to grow in all the wildernesse, but only a kind of thorne or thistle, cal- led the thirly or dry thorne, and the same but here and there in very few places: whereas in the red sea whole woods do liue, and namely of Baies and Oliues bearing their berries: also when it raineth, certaine Mushromes, which no sooner be caught with the Suns heat, but they turne into the pumish stone. As touching the shrubs there growing, they be commonly three cubits high, and those so full of sea dogs and cures, that a man shall hardly looke out of the ship in safety, for that many times they will take hold of the very ores and assaile them. The souldiers of *Alexander* the Great who sailed into India made report, That the branches and leaues of the sea trees, so long as they were vnder the water looked green, but when they be taken forth, pre- sently dried with the heate of the Sun, and became salt. Also, that about the shore they found stony rushes and reeds, like vnto naturall rushes indeed. Moreouer, in the deep sea they light on certain little trees branched and full of boughes, in colour of an Ox horne, but the head or top of them was red: handle them in your hand they were as brittle as glasse: put them into the fire they would be red hot like iron: quench them again, they returned to their former colour. In the same tract there be some tides so high, that the sea ouerfloweth and couereth the Woods growing within the Islands, although there be trees in them taller than the highest Planes or Poplars. And those trees beare leaues like Lawrell, and floures for smel and colour resembling the Violet. Their berries be like to Oliues, and those of a pleasant and sweet sauer, which they bring forth in the Autumne: and their leaues neuer shed but continue all the yeare long. The lower sort of these trees the froud couereth all and whole: but the greatest beare vp their heads about the sea, whereunto the mariners do fasten and tie their vessels at a high water: but when it is ebbe, at the very root. Moreouer, by their saying, they saw other trees in the same sea, with leaues euer green vpon them, carying a fruit like to Lupines. King *Iuba* reports, That about the Islands of the Troglodites, there groweth a shrub within the sea, called *Isidos Plocamos*, [*i. Isis haire*] resembling coral, and void of leaues: cut a branch of it from the stock, it becomes hard, changeth colour, and is black: if it fall it is so tender that it will breake like glasse. He speaks moreouer of another called *Charito-blepharon*, which is of great force in amorous matters to procure loue: and thereof women (quoth he) make them carkanets and pendant ornaments to hang about their necks. To conclude, he affirms that this shrub hath a certain intelligence when a man would take hold of it, and therefore waxeth as hard as an horne, inso much as it is able to turne the edge of a knife or bill, that vnneth or hardly it may be cut: but in case it be intrapped and drawne vp with cords without any edge toole, it presently turneth to be a stone.
